In 2005, the membership expressed a range of views about ARL's ongoing involvement in leadership development, especially about the appropriate level of investment of dues to address issues in this arena. The Board established a Task Force on Leadership Development to provide advice on ARL's future approach to addressing executive leadership development issues on behalf of its member libraries. The task force was asked specifically to identify and clarify needs for executive leadership development and succession planning in research libraries and to develop recommendations for strategies to be adopted by the Association for addressing those needs. The responses to a survey conducted by the task force indicated a convergence of views on the need for leadership development resources, especially for executive leadership roles, yet a range of views on how ARL should contribute to meeting those needs. The task force recommended that ARL make a targeted investment to address a set of leadership development needs in the evolving research library environment.

ARL and five member libraries piloted the ARL Research Library Leadership Fellows Program in 2005. This new executive leadership program identifies the unique demands facing directors of large research libraries and prepares participants to develop the skills and professional networks to move into those positions. The pilot program was sponsored by the University of California at Los Angeles; Columbia University; University of Illinois at Urbana-Champaign; University of Texas at Austin; and University of Washington. The second offering began in 2007 and was sponsored by the University of California, Berkeley and the California Digital Library; Harvard University; University of Minnesota; North Carolina State University; Pennsylvania State University; and the University of Toronto. The program offers an opportunity for development of future senior level leaders in large

research libraries. It exposes and engages library staff who have the desire and potential for leadership at ARL libraries to themes and institutions that will enhance their preparedness.

COLLECTIONS AND ACCESS

Global Resources

The importance of foreign materials to research libraries was a concern to the Association almost from its beginning. The Farmington Plan, proposed in 1942 by a committee of the Librarian's Council of the Library of Congress, was sponsored by ARL in 1944 and began operation in 1948. The plan was a voluntary agreement under which some 60 libraries attempted to bring to the United States at least one copy of each new foreign monograph of research value. In 1968, with a grant from the Ford Foundation, ARL established its Center for Chinese Research Materials to help bring rare and scattered Chinese materials to libraries at a reasonable cost. The center became a separate organization in 1986.

The ARL Foreign Acquisitions Program, begun in 1991 with support from The Andrew W. Mellon Foundation, assessed the state of global resources in research libraries in North America. The project found a pattern of retrenchment across most collecting areas and an aggregate reduction on the number of unique titles acquired from overseas. A variety of strategies to monitor and respond to this situation were recommended. In 1995, the ARL Board approved the strategic plan for the AAU/ARL Global Resources Program (GRP) as part of the Association's collections activities. The program began in early 1997 with funding from The Andrew W. Mellon Foundation. Originally intended to be a three-year grant, the funding enabled over five years of activity focused on improving access to international research materials through cooperative structures and the use of new technologies, and on generating increased communication with the scholarly community regarding future information needs. In addition, the GRP funding served as seed money for the regional projects, two of which received significant additional funding from the U.S. Department of Education's Title VI Program for Technological Cooperation and Innovation for Foreign Information Access. The regional projects sponsored by the GRP addressed seven countries or world areas: Africa, Eastern Europe, Germany, Japan, Latin America, South Asia, and Southeast Asia. Each developed differently, based on the needs of scholars who use materials from the area and on the perceptions of area specialist librarians of the most pressing challenges for information access.

In 2003, the GRP Advisory Committee, comprised of leaders from both libraries and the academy, reaffirmed the program's importance as a sustainable, broad-gauged

vehicle through which AAU and ARL could combine cooperation with technology in order to expand access to international information. The report, "Scholars, Libraries, and the AAU/ARL Global Resources Program," framed a discussion of several different organizational scenarios and the associated financial options. As a result, the GRP was reframed as the Global Resources Network (GRN).

On January 1, 2006, the Center for Research Libraries (CRL) assumed leadership, governance, coordination, and services of the GRN. During the transition year, the existing GRN Advisory Committee continued to provide intellectual leadership and direction to the network, ensure a smooth transition, and provide ARL oversight while ARL members contributed to GRN funding. CRL now provides administrative, technical, legal, financial management, and communications support for the regular activities of the GRN and its related projects.

Special Collections

For research libraries, special collections are a point of considerable pride. Indeed, these collections are what distinguish and differentiate research libraries. ARL conducted surveys of special collections in member libraries in 1979 and 1998. The goals of the 1998 survey were to equip members to protect and promote special collections as an essential element of research libraries; to articulate the role of special collections within the library program; and to visibly integrate special collections with the goals of the library and the university. The survey results found that special collections constitute a vast and varied resource that is growing not only in size but in scope. http://www.arl.org/bm~doc/spec_colls_in_arl.pdf.

In 2001, a symposium was held at Brown University to explore the prospects and promise of special collections in the expanding electronic environment. "Building on Strength: Developing an ARL Agenda for Special Collections" brought together ARL directors, heads of special collections, invited guests, and speakers to articulate a long-term programmatic agenda for special collections in research libraries. <http://www.arl.org/rtl/spccoll/spcollres/>

An ARL Special Collections Task Force was formed in late 2001 and charged to engage and advance the agenda that emerged from the symposium. This group brought together ARL directors and special collections librarians, including representatives of the ALA Rare Books and Manuscripts Section (RBMS) and the Society of American Archivists (SAA). They developed a report and an action plan that addresses key points in the symposium agenda, including: enhancing access to collections and backlogs; coordinating planning for collecting nineteenth and twentieth century materials and those in new formats; defining core competencies among special collections librarians and creating training opportunities; and incorporating

special collections topics into the agenda of ARL standing committees. <http://www.arl.org/rtl/speccoll/spcolltf/>.

Over 190 participants from libraries, archives, and funding agencies attended the “Exposing Hidden Collections” conference in 2003 to explore the challenges of providing access to uncataloged and unprocessed archival, manuscript, and rare book materials. One of the major recommendations from the conference was identification and promotion of a shared commitment to certain themes and subjects to encourage cooperative action among libraries and archives to process this material. A survey assessed the interest of libraries and archives in cooperative projects on the themes and also asked for brief descriptions of the top three hidden collections a library or archive was most eager to process, regardless of theme, format or vintage. The task force recommended the development of a position statement to encourage libraries and archives to expose hidden collections through some form of expedited access; a recommendation for a technical strategy for an inventory of unprocessed collections that includes establishing cooperative ties to the Program for Cooperative Cataloging and with the group revising the rare book cataloging standard; and an ACRL/RBMS pre-conference on using collection level records to deal with backlogs of unprocessed special collections. The white paper and a summary of the conference discussions are available at <http://www.arl.org/rtl/speccoll/hidden/>.

Throughout the work of the Special Collections Task Force, the urgent need to develop the next generation of special collections librarians and administrators has been a recurring theme. A small working meeting was held in 2003 that brought together library directors, special collections librarians and archivists, and library and information science educators to discuss possible responses to this critical situation. The white paper “Education and Training for Careers in Special Collections” found a pressing need for recruitment, education, and training of special collections professionals at all career levels. It calls for the articulation of professional competencies needed for positions in special collections, the development of a shared culture among librarians and archivists, and encouragement of the provision of opportunities for development and professional growth for mid-career practitioners. <http://www.arl.org/rtl/speccoll/spcolltd/>.

A statement of principles, “Research Libraries and the Commitment to Special Collections,” contained the key message that

Special Collections represent not only the heart of an ARL library’s mission, but one of the critical identifiers of a research library. . . . The development, preservation, support, stewardship, and dissemination of major special collections is both a characteristic of the true research library, and an obligation assumed by all members of the Association of Research Libraries.

The statement also articulates the kind of actions that member libraries of ARL should take to support special collections, including providing reliable funding for the support, staffing, and preservation of special collections; building special collections in keeping with institutional collection development policies, existing strengths, and regional or national commitments; and entering a new collection area only if there is a firm commitment to develop the collection and make it accessible to users. <http://www.arl.org/rtl/speccoll/speccollprinciples.shtml>.

In 2006, the RTL Steering Committee reviewed the final report of the Special Collections Task Force and identified priority elements for ARL’s future agenda on special collections as encouraging concerted action and coordinated planning for collecting and exposing nineteenth and twentieth century materials in all formats (rare books, archives and manuscripts, audio, and video); and identifying criteria and strategies for collecting digital and other new media material that currently lack a recognized and responsible structure for stewardship. The steering committee established a new Special Collections Working Group in 2007 to pursue this new agenda. <http://www.arl.org/rtl/speccoll/spcolltf/status0706.shtml>.

Resource Sharing

For many years the access services program undertook activities to support resource sharing among research libraries in the electronic environment and to improve access to research information resources while minimizing costs for libraries. This program worked to strengthen interlibrary loan and document delivery performance, interoperability among library systems, cooperative cataloging programs, and policies that increased user access to information both onsite and remotely.

A centerpiece of the program was the North American Interlibrary Loan and Document Delivery (NAILDD) Project, initiated by ARL in 1993 to facilitate the development of standards, software, and system design capabilities to improve interlibrary loan and document delivery (ILL/DD) services for users, and to make them more cost effective for research libraries. The NAILDD Project involved the collaboration of over 40 key ILL/DD vendors and system suppliers.

The first Directors Forum on Managing ILL/DD Operations was held in 1995 and marked the beginning of concerted efforts to understand and improve interlibrary loan and document delivery services. The Interlibrary Loan/Document Delivery Performance Measures Study was a two-year effort to measure the performance of ILL departments in 119 North American research and college libraries. The study, funded by The Andrew W. Mellon Foundation, examined four performance measures: direct cost, fill rate, turnaround time, and user satisfaction. This study highlighted the characteristics of high-performing borrowing and lending operations in research libraries.

Techniques to implement these “best practices” were the basis for the “From Data to Action” workshops. Over 400 librarians and representatives from the commercial community attended the twelve workshops offered between October 1998 and March 2001.

The Assessing ILL/DD Services Study in 2002 and 2003 was ARL’s third effort in a decade to measure the performance of interlibrary loan operations in North American libraries. The study tracked the performance of mediated and user-initiated ILL/DD operations in 72 research, academic, and special libraries including unit cost, fill rate, and turnaround time for mediated borrowing and lending services. These same measures were also taken for seven user-initiated services. The final report of the study, “Assessing ILL/DD Services: New Cost-Effective Alternatives,” confirmed that, in general, user-initiated services have lower unit costs, higher fill rates, and faster turnaround times than mediated ILL/DD services. The report also identified high-performing borrowing and lending operations and laid out strategies for libraries seeking to improve local services.

STATISTICS AND MEASUREMENT

The ARL Statistics and Measurement Program focuses on describing and measuring the performance of research libraries and their contributions to research, scholarship, and community service. ARL serves a leadership role in the development, testing, and application of academic library performance measures, statistics, and management tools. Grounded in the tradition of the North American research library environment, the program provides analysis and reports of quantitative and qualitative indicators of library collections, personnel, and services by using a variety of evidence gathering mechanisms, and tools. <http://www.arl.org/stats/>.

ARL Statistics

ARL Statistics is a series of annual publications that describe the collections, expenditures, staffing, and service activities for the member libraries of the Association of Research Libraries. The annual statistics series also includes the *ARL Academic Health Sciences Library Statistics*, the *ARL Academic Law Library Statistics*, and the *ARL Preservation Statistics*.

The *ARL Annual Salary Survey* is a compilation of data covering over 12,000 professional positions in ARL libraries. Tables display average, median, and beginning salaries; salaries by position and experience, sex, and race/ethnic background; and salaries in different geographic regions and sizes of libraries. Additional tables cover law, medical, Canadian, and nonuniversity research libraries. <http://www.arl.org/stats/annualsurveys/>.

Performance Measures

New measures that address issues of service quality, electronic resource usage and value, and outcomes assessment are also being developed. StatsQUAL®, is a gateway to library assessment tools that describe the role, character, and impact of physical and digital libraries. Through StatsQUAL®, libraries gain access to a number of resources that are used to assess library’s effectiveness and contributions to teaching, learning, and research. StatsQUAL®, presents these tools in a single powerful interactive framework that integrates and enhances data mining and presentation both within and across institutions. StatsQUAL®, includes instruments and data such as LibQUAL+®, DigiQUAL®, and MINES for Libraries®, as well as a growing dataset of survey results.

LibQUAL+® is a rigorously tested Web-based survey that libraries use to solicit, track, understand, and act upon users’ opinions of service quality. Results have been used to develop a better understanding of perceptions of library service quality, interpret user feedback systematically over time, and identify best practices across institutions. <http://www.libqual.org/>.

The DigiQUAL® project is modifying and repurposing the existing LibQUAL+® protocol to assess the services provided by digital libraries. DigiQUAL® has identified 180+ items around twelve themes related to digital library service quality. The first phase of DigiQUAL® involved testing subsets of these elements with five pilot sites.

MINES for Libraries®™ is an online transaction-based survey that collects data on the purpose of use of electronic resources and the demographics of users. As libraries implement access to electronic resources through portals, collaborations, and consortium arrangements, the Measuring the Impact of Networked Electronic Services (MINES) protocol offers a convenient way to collect information from users in an environment where they no longer need to physically enter the library in order to access resources.

To address the issues of learning outcomes, ARL supported Project SAILS (Standardized Assessment of Information Literacy Skills). This 2003–2006 project was funded through an IMLS grant to Kent State University to develop a Web-based standardized test that allowed cohorts of students to be evaluated against the ACRL Information Literacy Competency Standards for Higher Education. Kent State made the project operational at the end of 2006. <http://www.projectsails.org>.

ARL is helping libraries develop effective, sustainable, and practical assessment activities that demonstrate the libraries’ contributions to teaching, learning, and research. “Effective, Sustainable, and Practical Library Assessment,” grew out of a two-year project called “Making Library Assessment Work,” which involved 25 libraries during 2005–2006. The service involves a site visit to each participating library, a report to each library with

recommendations on practical and sustainable assessment, and follow-up assistance in implementing the recommendations. It is now open to both ARL member and nonmember libraries. <http://www.arl.org/stats/initiatives/espassessment/>.

TECHNOLOGY

As a strategic response to the realization that telecommunications networks would play a major role in the reform and enrichment of teaching, learning, and education in the twenty-first century, ARL, CAUSE, and EDUCOM (now EDUCAUSE) formed the Coalition for Networked Information (CNI) in 1990. CNI is an organization dedicated to advancing the transformative promise of networked information technology for the advancement of scholarly communication and the enrichment of intellectual productivity. In establishing CNI, the sponsor organizations recognized the need to broaden the community's thinking beyond issues of network connectivity and bandwidth to encompass networked information content and applications. Reaping the benefits of the Internet for scholarship, research, and education demands new partnerships, new institutional roles, and new technologies and infrastructure. The Coalition seeks to further these collaborations, to explore new roles, and to catalyze the development and deployment of the necessary technology base. <http://www.cni.org> (See the entry on "Coalition for Networked Information (CNI)," p. 1080.)

ARL's Web site was established in 1994 and by the end of 2006 had grown to be extremely large and complex, consisting of over 50,000 pages. In January 2007, ARL launched a newly designed Web site. The updated, streamlined design was developed to improve navigation within the site. The new site focuses on current activities of the Association and many legacy files were not migrated. These were archived and are made available upon request.

MEMBERSHIP

Membership in the Association of Research Libraries is necessarily limited to research institutions sharing common values, goals, interests, and needs. The members of ARL are research libraries distinguished by the breadth and quality of their collections and services. Each member also makes distinctive contributions to the aggregation of research resources and services in North America. Membership is based on the research nature of the library and the parent institution's aspirations and achievements as a research institution. Membership is by invitation upon the recommendation of the Board of Directors and approval of the membership. Once achieved, membership is presumed

to be continuing. The criteria for ARL membership derive from efforts to define a universe of similar institutions that share a commitment to providing the materials and services needed for serious study and research. The principles and procedures of membership are explained at <http://www.arl.org/arl/membership/qualprin.shtml>. A list of member institutions is at <http://www.arl.org/arl/membership/members.shtml>.

GOVERNANCE

ARL's Board of Directors is composed of 12 member library representatives who are elected by the membership to serve 3-year terms. ARL committees, task forces, and working groups are also composed of member representatives who wish to work on specific issues important to the Association membership. There are steering committees for each of the three strategic directions: Scholarly Communication, Public Policies Affecting Research Libraries, and Research, Teaching, and Learning. The chairs of these committees serve as nonvoting ex officio members of the ARL Board. Other standing committees include the Membership Committee, Nominating Committee, and Statistics and Assessment Committee. A number of Advisory Committees, Working Groups, and Task Forces work on specific projects and programs of the Association. They are ongoing or temporary as appropriate. <http://www.arl.org/arl/governance/cmte.shtml>.

There are two membership meetings each year to transact business, provide a forum for discussion of emerging issues, and build the Association's agenda. Since the 1970s, member representatives and invited guests have gathered at an October meeting in Washington, D.C., and a May meeting hosted by and near a member library. During the fall meeting, in addition to committee meetings and group discussion sessions, the membership approves the dues for the coming year and elects new Board members. The spring meeting agenda is built around a specific topic of concern to research libraries. Minutes, and later Proceedings, of meetings 1–133 are available in print. Proceedings since meeting 124 are available at <http://new.arl.org/resources/pubs/mmproceedings/>.

BIBLIOGRAPHY

A more detailed history is Frank M. McGowan's doctoral dissertation, *The Association of Research Libraries 1932–1962* (University of Pittsburgh, 1972).

Association of Specialized and Cooperative Library Agencies (ASCLA)

Barbara A. Macikas

American Library Association, Chicago, Illinois, U.S.A.

Abstract

The Association of Specialized and Cooperative Library Agencies (ASCLA) is a division of the American Library Association (ALA). ASCLA is the professional home for state library agency personnel, librarians serving special populations, multitype librarians, and consultants and other independent librarians. The ASCLA members were strong advocates of the Library Services and Technology Act (LSTA) and will be active in urging reauthorization of the act. The ASCLA also sponsors the Americans with Disabilities Act (ADA) Assembly, an ALA-wide group designed to foster coordination of efforts to meet the challenges and opportunities presented by the ADA legislation.

INTRODUCTION

The Association of Specialized and Cooperative Library Agencies (ASCLA), a division of the American Library Association (ALA), enhances the effectiveness of library service by providing networking, enrichment and educational opportunities for its diverse members, who represent state library agencies, libraries serving special populations, multitype library organizations and independent librarians. It is a community that focuses on evolving issues that cut across library boundaries. Emphasizing the future, ASCLA supports individuals in their personal development and career growth.

DEFINITIONS

State library agencies are those organizations created or authorized by the state government to promote library services in the state through the organization and coordination of a variety of library services.

Specialized library agencies are those organizations that provide materials and services to meet the information needs of persons whose access to library services and materials is limited because of confinement, sensory, mental, physical, health, or behavioral conditions.

Multitype library cooperatives are combinations, mergers, or contractual associations of two or more types of libraries (academic, public, special, or school) crossing jurisdictional, institutional, or political boundaries, working together to achieve maximum effective use of funds to provide library and informational services to all persons above and beyond those that can be provided through one institution. Such cooperative agencies may be designed to serve a community, a metropolitan area, a region within a region, or may serve a statewide or multistate area.

Independent librarians provide services outside of the traditional library setting.

MEMBERSHIP

The ASCLA has the distinction of being the ALA's smallest division yet it has the most diverse membership. With just over 1000 members, ASCLA is the professional home for state library agency personnel, librarians serving special populations, multitype librarians, and consultants and other independent librarians. These four groups joined together over the years when various other ALA divisions and roundtables merged. For example, in 1977, two ALA divisions, the Association of State Library Agencies and the Health and Rehabilitative Library Services Division merged and took on the name ASCLA. The independent librarians joined ASCLA in 1998 when their ALA roundtable, Independent Librarians' Exchange Round Table voted to merge with the division.

ORGANIZATION

The ASCLA is organized into four membership sections: Independent Librarians' Exchange Section, Interlibrary Cooperation and Networking Section (ICAN), Libraries Serving Special Populations Section (LSSPS), and State Library Agency Section (SLAS). Each section offers members committee and discussion group opportunities. The ICAN offers discussion groups on interlibrary cooperation, the virtual library, and network management. The LSSPS offers the following forums: Library Service to People with Visual or Physical Disabilities, Library Service to the Deaf, Library Service to the Impaired Elderly, and Library Service to Prisoners. The SLAS offers

discussion groups for Library Services and Technology Act (LSTA) coordinators, consultants for services to children and young adults, consultants to institutional libraries, and state library consultants.

The ASCLA also sponsors the Americans with Disabilities Act (ADA) Assembly, an ALA-wide group designed to foster coordination of efforts to meet the challenges and opportunities presented by the ADA legislation.

PUBLICATIONS

The ASCLA publishes *Interface*, a quarterly newsletter containing news of division activities. The association also publishes monographs; recent titles include *Guidelines for Library Services for People with Mental Illnesses*; *Revised Standards and Guidelines of Service for the Library of Congress Network of Libraries for the Blind and Physically Handicapped*; *The Functions and Roles of State Library Agencies* and *Library Networks in the New Millennium: Top Ten Trends*.

AWARDS AND SCHOLARSHIPS

The ASCLA sponsors the following awards and scholarships:

- The ASCLA Exceptional Service Award: A citation presented to recognize exceptional service to patients; to the homebound; to medical, nursing, and other professional staff in hospitals; and to inmates.
- The ASCLA Leadership and Professional Achievement Award: A citation presented to recognize leadership and achievement to one or more ASCLA members in the following areas of activity: consulting, multitype library cooperation, networking, statewide service and programs and state library development.
- The Cathleen Bourdon Service Award: A citation presented to recognize an ASCLA personal member for outstanding service and leadership to the division.
- The ASCLA/National Organization on Disability Award: A \$1000 award and certificate for a library organization that has provided outstanding services for people with disabilities.
- The Francis Joseph Campbell Award: A citation and medal presented to a person who has made an outstanding contribution to the advancement of library service for the blind and physically handicapped.
- The Century Scholarship: Up to \$2500 annually to be used for accommodations or services not provided by law or the university to a student or students with a disability pursuing a degree in library and information science at an ALA-accredited library school. The award supports the ALA mission of improving service at the local level through the development of a representative

workforce that reflects the communities served by all libraries in the new millennium.

CONTINUING EDUCATION OPPORTUNITIES

During the ALA Annual Conference, the ASCLA offers programs on topics such as planning and implementation of open source software for cooperatives and consortia, universal accessibility of physical and virtual collections and of the physical plant, outreach and leadership. The association also presents full-day workshops before the ALA Annual Conference on topics such as accessibility, strategic planning, and sustainability. Finally, the ASCLA has developed an online continuing education course on the topic of selecting Spanish-language materials for adults, an introductory course to help public library staff learn the basics of developing a Spanish-language collection.

STANDARDS

The ASCLA sets standards on recommended performance for the profession. The association has adopted the following standards:

- The Functions and Roles of State Library Agencies, 2000.
- Guidelines for Library and Information Services for the American Deaf Community, 1995.
- Library Standards for Adult Correctional Institutions, 1992.
- Library Standards for Juvenile Correctional Institutions, 1999.
- Library Services for People with Mental Retardation, 1999.
- Revised Standards of Service for the Library of Congress Network of Libraries for the Blind and Physically Handicapped, 1995.

PROBLEMS AND ISSUES

One of ASCLA's challenges is to increase membership rates. Although there are advantages to being a small organization with a diverse membership, it is critical that ASCLA recruit more members. Building the membership will help provide a better financial footing for the organization. Another challenge is to find effective and economical ways of providing continuing education to members, particularly those members who are unable to attend ALA conferences. ASCLA has begun a program on online continuing education and has plans to increase the number of topics in this area.

CONCLUSION

The ASCLA members were strong advocates of the LSTA and will be active in urging reauthorization of the act. The ASCLA members closely worked with the ALA Washington Office on the development of a website database that provides stories of the impact LSTA funds have had on local communities and ASCLA's Legislative Committee works to strengthen ALA's advocacy efforts in this arena.

Members of the ADA Assembly will continue to assist libraries in making their services and collections assessable to people with disabilities through such policy statements and development of new guidelines for libraries.

In 2007, the ASCLA ICAN members and other librarians from networks, cooperatives and consortia, participated in the development of the first-ever database of information about how networks and cooperatives operate and the many ways in which these collaborative

organizations help to advance learning communities. The ASCLA will encourage participants from the base study to regularly update directory information and the data derived from the surveys to keep the data as up-to-date as possible. The final report database is housed on the ASCLA web. Data was collected from over 200 participating library networks, cooperatives and consortia. The data was collected through a project administered by the ALA Office for Research and Statistics (ORS) and funded in part by a grant from the Institute of Museum and Library Services.

Australia: Libraries, Archives, and Museums

Alex Byrne

University of Technology, Sydney—Sydney, New South Wales, Australia

Abstract

Over the two centuries since European settlement, Australia has developed fine archives, libraries and museums which are guided by strong curatorial professions. Globally linked and technologically proficient, their standards conform to international models of good practice and sometimes lead the way. The particular challenges posed by distance within a very large country and distance from major centers of curatorial practice and the opportunities offered by an advanced economy have enabled Australia's museologists, archivists and librarians to engage with distinctive issues including those relating to the development of a new multicultural national identity which celebrates both the ancient Indigenous knowledge systems and those brought by visitors and settlers since 1788.

INTRODUCTION

Occupied by humans for some 60,000 years, Australia has long traditions of preserving and transmitting knowledge both orally and through iconographic art as well as the development of technology. However, it was with the arrival of British colonizers from 1788 that European modes of keeping records, gathering collections and publishing observations and opinions as well as the habits of reading and book-based study came to the southern continent. The colonizers brought with them the emerging concepts of modern libraries, museums and archives that were being developed in northern Europe and North America and which were significantly shaped by the Enlightenment. And the explorers and colonizers displayed a need both to share their new found knowledge about the vast land which they encountered and to stay in touch with developments at “home” on the other side of the world.^[1]

As settlement proceeded through the nineteenth century, the establishment of museums and libraries marked the growing maturity of the developing colonial cities of Sydney, Hobart, Melbourne, Brisbane, Adelaide and Perth and some significant ports and regional centers. The creation of those institutions confirmed to the European sensibilities of both settlers and visitors that the new cities were truly becoming civilized and that the frontier of settlement was receding from them. In postgold rush “Marvelous Melbourne,” for example, the establishment and construction of the imposing Museum and Library of Victoria on one of the grand avenues, Swanston Street, signaled that the city's aspiration to be considered one of the great cities of the British Empire.

After protracted negotiations, the colonies agreed to federate to create a new nation, the Commonwealth of Australia, on January 1, 1901. The words of the first prime minister of Australia, Sir Edmund Barton, “For the first

time in history, we have a nation for a continent and a continent for a nation,”^[2] expressed the greatest challenge to all institutions in Australia, the “tyranny of distance.”^[3] While the nation spreads across an area (7,682,300 km² or 2,966,153 mi²) which is almost the same as the total size of the contiguous United States of America, much of the country is arid and the northern part is tropical and mostly extremely remote. The population (now approximately 21 million) was, and continues to be, concentrated in cities and major towns along the coastline, especially in the southeastern quarter. With the exception of the national capital which is located 147 km (92 mi) inland in the purpose built city of Canberra, both governments and major civic and private institutions have been located in the coastal capitals. With vast distances and thin populations it has been difficult to provide services across the nation to smaller cities, towns and remote communities (Fig. 1).

The other key aspect of distance, the distance from the primary centers of professional validation in Europe and North America, constrained Australia's libraries, archives and museums in the early years but has been a lesser concern since the spread of modern transport and telecommunications technologies which place Australians less than 24 hr flight or a few mouse clicks from those centers. Although Australia lacks any borders with adjoining nations, its peoples have long had links to other countries. They extended from the trade and cultural links that the Yolgnu of northeastern Arnhem Land enjoyed for centuries with the Macassan trepang (*Holothuria* sp. also known as *bêche de mer* or sea cucumber) fishermen from their north to today's complex of familial, cultural, trade and professional linkages. That diverse globalism was vastly enriched through the large-scale mass migration programs initiated after World War II. A continuing process, it has brought people from some 200 nations to Australia, changing it and its institutions from the

Fig. 1 Map of Australia from *CIA World Factbook*.

formerly predominant orientation towards British institutions and models to a confident transnational outlook.

One of the first nations to introduce free, secular and compulsory elementary education with the pioneering Education Acts in Victoria and the other colonies from 1872, Australia has long enjoyed high standards of education and high levels of literacy. A culture of reading was well established even in nineteenth century rural life and Australia continues to rank highly in international comparisons of literacy and numeracy. Its researchers produce some 2% of the recognized international scholarly literature, a proportion much higher than its population would indicate. Science was inspired by the unique flora and fauna (first noted by early visiting explorers and collectors, notably Sir Joseph Banks on James Cook's *Endeavour* in 1770), the need to develop agriculture appropriately for the various climatic regions and soils, and the identification of ore bodies. Research and technological development has tended to follow those priorities with marked international standing in biomedicine, agriculture and the extractive industries.

Those strengths echo the orientation of Australia's economy to global trade essentially in agricultural, mining and energy commodities and, more recently, financial, professional and educational services. A domestic manufacturing sector has been reshaped by the progressive removal of trade barriers since the 1980s so that most manufactured goods are imported and a fairly small number of companies produce for export. Publishing and other creative industries in Australia face a considerable challenge from imported media and consequently focus on

generating Australian cultural products with low levels of governmental support.

As in the United States, the Australian states have considerable autonomy within the federation so the early differences among them and their institutions have persisted to a significant extent. The national institutions have lacked the authority to direct state and local institutions and their status as the leading national institutions has in some cases been contested by longer established state institutions. Only the National Library of Australia has had legislated authority to provide leadership within its sector but even it has had to attempt to lead by persuasion rather than direction and the legitimacy of that role has sometimes been questioned.

However, the combination of relatively small professional communities with quite strong professional associations has led to good communication and sharing across the memory professions. This has resulted in consistent standards of practice which have been shaped by well-regarded professional education programs and which rate highly in international comparisons. English speaking, welcoming to expatriates from other countries and willing to travel, Australian professionals have been well informed about developments in other countries, especially the British Isles and North America and have been known as innovators and early adopters of innovations. An increasing number have practiced in other countries or have provided leadership in their professions internationally.

LIBRARY AND INFORMATION PROFESSIONS, SYSTEMS AND SERVICES

Origins and Legislation

Following examples imported from Britain, the earliest libraries in Australia were subscription libraries and mechanics' institutes.^[4] The Australian Subscription Library and Reading Room, established in Sydney in 1826, replaced a cooperative lending system created by some of the town's leading citizens who had made a shared catalog of their private libraries in 1821. By fits and starts, this led to the opening of a free public reference library in 1869 and the establishment of a lending branch in 1877 and a country-circulating department in 1883. The lending branch was subsequently transferred to the corporation of the city of Sydney in 1909 and added a children's section in 1915.

Melbourne's experience was happier. A mechanics' institute had been initiated in 1840 but Judge Redmond Barry's establishment of a free circulating library in 1842 was the genesis of the first free public library in Australia. Its construction and the purchase of books were approved by the parliament of the colony, newly separated from New South Wales and rich from gold discoveries, with

Barry as chairman of the board of trustees. The other colonies (which became states following their federation for forming the Australian nation in 1901) followed similar patterns during the late nineteenth century (Fig. 2).

However, the development of libraries in Australia was somewhat slow and patchy until the middle of the twentieth century. The landmark investigation by Ralph Munn and Ernest Pitt which was supported by the Carnegie Corporation of New York and whose report, known eponymously as the Munn-Pitt Report,^[5] was published in 1935 demonstrated that much had to be done to provide adequate library services across the continent. Implementation of its recommendations was delayed by World War II but the report laid the foundations for the well-regarded libraries of modern Australia.

In common with other institutions in Australia, libraries open to the public have been largely initiated in response to public pressure but then funded and administered by government. Public library provision is a responsibility of local authorities in urban municipalities and rural shires sometimes through collaborative regional services. State libraries are established by state legislation, such as the Library Board of Western Australia Act 1951. Together with the state libraries and the University of Sydney, the National Library benefits from legal deposit legislation applying to printed publications, although its scope has yet to be extended to digital publications. Other legislation of particular relevance to libraries includes the Copyright

Act 1968, Classification (Publications, Films and Computer Games) Act 1995 and complementary state laws, Disability Discrimination Act 1992, national and state privacy legislation, and laws relating to online services. Australia lacks a national charter of rights but freedom of expression and freedom of access to information have been substantially protected under the common law system.

National Library and Information Services

In 1901, the first federal parliament recognized the need to establish a collection and services to support its work. The Commonwealth Parliamentary Library was transferred to the new capital, Canberra, with the parliament in 1926. Earlier, the growing collection had been significantly augmented when the Australiana collection of E.A. Petherick was acquired in 1909, laying the foundation for the Commonwealth National Library. That function was eventually separated from the Parliamentary Library by the National Library Act 1960 which gave it several responsibilities: the development of a national collection which would be comprehensive in relation to Australia and the Australian people, provision of bibliographical services, and cooperation in library matters including “the advancement of library science.”

The National Library has vigorously pursued the creation of the national collection which now extends to digital

Fig. 2 The statue of the founder of the State Library of Victoria, Sir Redmond Barry, surveys the passing throng before its imposing building on Swanston Street, Melbourne (Photographer Alex Byrne).

resources as well as the traditional printed, pictorial, cartographic and audiovisual resources. In spite of some competition from state heritage collections, especially the rich resources held by the Mitchell Library at the State Library of New South Wales, its collections have achieved the status which was required by the Act. Establishment of the Australian Bibliographic Network in 1981 as a vehicle for collaborative development of bibliographic services demonstrated the foresight and innovation of Australian librarians. Now known as Libraries Australia, the combination of the Australian National Bibliographic Database and various shared services have positioned Australian libraries well to take advantage of new technologies including the emerging Web 2.0 capabilities. It is an excellent example of collaboration which has involved libraries of all types and returned benefits to all and to their clients. In a related area, the National Library coordinates the national cooperative interlibrary loan service, so vital for a very large nation.

In other aspects, the National Library's attempts to show leadership have been more contested. The Australian Libraries Summit convened in October 1988 under the leadership of Warren Horton, then Director-General of the National Library, brought together leaders of the profession from all sectors but few of its recommendations had far reaching results. More recently, his successor as Director-General, Jan Fullerton, has encouraged less publicized but more strategically focused collaboration as a member of National and State Libraries Australasia (NSLA which includes the National Library of New Zealand/Aotearoa). Among the innovations which that collaboration has delivered is PictureAustralia that has exposed the invaluable image collections of NSLA members and other participants, resources which were previously very difficult to access. It has been followed by other collaborative services such as MusicAustralia and PeopleAustralia. Partnership also underpins the operation of the PANDORA Web Archive which was initiated in 1996 and aims to preserve the Australian Web domain. The collaborative traveling exhibition, *National Treasures from Australia's Great Libraries*,^[6] which followed the 2002 blockbuster *Treasures from the World's Great Libraries*,^[7] demonstrated the value of library heritage collections to a broad public as it was shown across Australia to enthusiastic crowds of visitors.

Various attempts have been made to develop national library and information plans but have been frustrated by the constitutional division of power and authority in the nation's federal structure, a factor which has similarly bedeviled many attempts at national planning in other spheres. For example, following the Scientific and Technological Information Services Enquiry Committee's report,^[8] the National Library attempted to establish a national science and technology library and information service in cooperation with the national scientific research organization, the Commonwealth Scientific and Industrial

Research Organisation (CSIRO). This failed to gain adequate financial support and the National Library eventually largely vacated the field, leaving the delivery of scientific and technological information to CSIRO, university and special libraries. However, the National Library maintained an important focus on collecting international publications in the social sciences and humanities, thereby fulfilling a role to inform Australians about the world.

State and Public Libraries

The state and territory library systems operate as the peak libraries for the public within their jurisdictions. They provide major reference libraries, maintain documentary heritage collections and provide support and coordination to public libraries. Some have additional responsibilities for the provision of services to government ministries or to schools. Because they were the first substantial libraries within their jurisdictions and are centrally located within the capital cities, the state libraries fulfill major roles as reference and research libraries and have substantial collections, especially on their home state or territory. Pre-eminent among those heritage collections is the Mitchell Library within the State Library of New South Wales. Founded by the gift of David Scott Mitchell which was announced in 1898, the collection is unsurpassed in the strength of its collections of Australian and particularly in items from or relating to the early settlement of Australia.^[9] His collection joins with the State Reference Library, the Dixson Collection and many other specialist collections to form a quasistate library operating at the state level to provide a rich resource for consultation by the general public as well as researchers. It is not a lending library but coordinates and supports the state's public library network under a regime which requires adherence to minimum standards in return for financial grants—a model broadly followed by all states and territories.

Although early library services in Australia were provided by private subscription libraries, mechanics' institutes and schools of arts, few private lending libraries survive. They were supplanted by the developing public library network. A notable exception is the Athenaeum Library in Melbourne which continues to offer a fine collection, comfortable reading room and a lively program of speakers.

Funding for each state's public library network is provided by state and local governments. Federal Government interest in public libraries was evident briefly when the Whitlam Labor Government commissioned an enquiry into public libraries under the chairmanship of Allan Horton, the University Librarian at the University of New South Wales and a forceful advocate for libraries in Australia.^[10] Its recommendations, unfortunately, were sidelined due to a change in government and economic difficulties in the late 1970s. Nevertheless, services have

continued to be expanded so that in Western Australia, for example, there are now 239 registered public libraries throughout a very large state.

The public libraries are lending libraries with relatively small reference collections and specialized services to assist such segments of their populations as the housebound, young children and business. Many operate mobile libraries and services to institutions such as nursing homes for the elderly. All provide Internet access which is usually filtered due to federal government law to protect children from exposure to undesirable materials. The libraries are sometimes operated through regional consortia spanning a number of local government areas particularly outside the major cities where they wrestle with the challenges of providing services to thinly dispersed populations. Other services of benefit to the public include those provided in hospitals and prisons and in remote mining communities (Fig. 3).

The particular challenges faced by Indigenous communities in remote areas have led to the development of the Indigenous Knowledge and Library Centre models, which have been pursued by the Northern Territory Library Service and the State Library of Queensland. Recognized by receiving the Access to Learning Award of the Bill and Melinda Gates Foundation in 2007, the Northern Territory approach seeks to offer Indigenous peoples a means of recording and holding traditional knowledge in culturally

appropriate ways as well as access to the mainstream information required to support education and community activity.

School and College Libraries

There are some 20,000 school libraries in Australia at both primary and secondary levels and located in the state and Roman Catholic diocesan school systems as well as in independent schools. Generally poorly housed and equipped until the late 1960s, except in the richer independent schools, they developed quickly after the Federal Government responded in 1968 to a library association campaign by providing earmarked funding to support their establishment.^[4] Staffing, however, remains variable with the best staffed by teacher librarians (who hold combined qualifications as teachers and librarians) but others staffed only by library technicians or supervised part time by a teacher.

Combined school community models provide a means of offering satisfactory library services in many areas outside major cities and towns, especially in South Australia and the Northern Territory. Although they can be challenging to manage because of the different needs of the student and general populations, the models have been successful and have been emulated in other countries.

Fig. 3 The striking Brisbane City Library defines a new public space across the river from the State Library of Queensland (Photographer Alex Byrne).

Australia's well-developed system of technical and further education is supported by good library services in the state operated technical colleges but little library support is evident from the private providers of technical education. The same must be said of private tertiary colleges, including those which offer courses to international students particularly in such fields as business, information technology, design and English language.

Academic and Research Libraries

Established in 1859, the University of Sydney was Australia's first university. It was soon followed by the University of Melbourne and at intervals by universities in each of the other colonial (state following federation) capitals. Originally modeled on U.K. universities, Australian universities tended to import academic staff and did not offer doctoral degrees until 1948. They were all established and to a considerable degree funded by government, benefiting only little from philanthropy.

After World War II, the drive to industrialize the economy and the commencement of very large infrastructure projects—notably the Snowy Mountains Scheme—created a demand for technologists. With the support of the federal Menzies Coalition Government, universities began to expand and the Australian National University (ANU) was established. It was followed by others until, by 1988, there were twenty-one universities in Australia as well as a network of state established colleges of advanced education and institutes of technology both of which were accredited to offer degrees but had extremely limited capacity to undertake research. In 1989, the federal Labor Government initiated a process by which the colleges and institutes merged with existing universities or with each other to form new universities. It also began to cap budgetary allocations to higher education by reinstating tuition fees with a system which permitted deferred payment via taxation surcharges. Extension of this policy by the succeeding Federal Coalition Government continued to reduce the proportion of government funding to higher education with the share at some universities declining from over 90% to around 30% by 2007. All now supplement their revenues by attracting large numbers of international students, enrolling almost 80,000 from more than 12 nations in 2002. However, the university system remained essentially government sponsored and regulated with 37 public but only three private universities.

At first, university libraries developed slowly. By the time of the Munn-Pitt report, their collections remained inferior to the state libraries and were almost all poorly housed and staffed. But, like their universities, they developed quickly during the decades following World War II. Quick to adopt new technologies, they benefited from close professional contact with colleagues in the United Kingdom and the United States and, increasingly, other nations. To support the expanding range of degree

programs and increasing emphasis on research, collections ballooned during the 1960s and 1970s and continued to grow steadily in spite of the difficulties caused by the increasing cost of serials and unfavorable exchange rates. Perhaps for that reason, Australian university libraries rapidly introduced policies to prefer digital journals. The Council of Australian University Librarians (CAUL), established as a committee of the universities' chief librarians who began meeting from 1927, became a much more businesslike vehicle for consortial purchasing as well as other collaborative activities (Fig. 4).^[11]

As the new millennium was reached, Australian university libraries were very well regarded internationally. They were considered to be leaders in a number of areas including their long-standing leadership in supporting distance education, the rapid adoption and application of information technologies, and the development of the focus on information literacy which has accompanied the emergence of the information society and the rapid spread of the Internet. Many university librarians assisted colleagues in universities elsewhere, particularly Southeast Asia and China. Among many acknowledged leaders were: Harrison Bryan who repositioned the libraries of the Universities of Queensland and Sydney as well as the National Library of Australia; John Shipp who drove the development of CAUL and promoted international relations as well as serving as University Librarian at the Universities of Wollongong and Sydney; Meg Cameron who promoted high standards of service to distance education students during her long service as University Librarian at Deakin University; and Arthur Ellis who promoted the development of the Australian Bibliographic Network during his service at the National Library of Australia and as University Librarian at the University of Western Australia.

Special Libraries

As the Australian economy matured, government departments, hospitals and business and industrial enterprises saw the need to establish libraries and information services to support their activities. Fine special libraries developed in companies such as the mining and steel giant BHP, publishing companies such as Fairfax and legal firms. Major acute hospitals were expected to have adequate library services which were often linked to university library services in support of medical and, later, nursing education. Government departments in particular frequently gave their libraries a broad ambit to collect widely. Improvements in the professional education of librarians created new expectations of professional service to their organizations and collaborative resource-sharing networks were established.

Extensive agricultural extension services were an early response to the need for development across a vast but thinly populated landmass. They led to the establishment

Fig. 4 The bronze-clad Fisher Library constructed in the 1960s contrasts with original neogothic sandstone buildings of the University of Sydney (Photographer Alex Byrne).

of agricultural colleges and many government research organizations that were established to investigate and provide advice on the development of the agriculture, mining and manufacturing sectors and, more recently, environmental protection. They included such bodies as the Sugar Research Institute, state departments of primary industries, the Australian Institute of Marine Science and the Great Barrier Reef Marine Park Authority and almost all developed good library services. Foremost among them was the national research and development body, the CSIRO, which provided in effect the national science and technology library and information services. Among the leaders of those services was Des Tellis who pioneered the Australian Earth Sciences Information System (AESIS).

However, changing priorities during the 1990s led to the closure or curtailment of many of these library and information services. Major research collections were transferred to university or other libraries or dispersed when tighter fiscal policies demanded narrower focus. The libraries and information services that survived demonstrated a capacity to visibly add value to their enterprises. Legal and medical services continue to be strong but many services in business and government have been eliminated or severely reduced.

Librarianship as a Discipline and Profession

Preeminent among Australian librarians and library educators must be John Metcalfe, long-term Principal Librarian of the Public (now State) Library of New South Wales, University Librarian at the University of New

South Wales and founder of what became the School of Information, Library and Archive Studies, University of New South Wales.^[4] His achievements as a library director, educator and innovator brought him international recognition.

Metcalfe was also instrumental in the establishment of the Australian Institute of Librarians in 1937, one of the immediate consequences of the Munn-Pitt report. It would become the Library Association of Australia (LAA) and subsequently the Australian Library and Information Association (ALIA).^[12] It replaced the LAA which had been established with representatives from all the Australian and New Zealand colonies in 1896 but had become defunct in 1928. Nevertheless, the creation of that first “LAA.” within two decades of the start of the first professional library associations in the United Kingdom and the United States demonstrated the commitment and ambition of Australian librarians to advance their field.^[13] Other specialist and regional associations have been established, including notably the Australian School Library Association, but ALIA remains the national professional organization which seeks to influence governments while fostering professional discourse and setting standards for professional education.

Professional education for librarians was introduced into universities and colleges of advanced education only from the late 1960s. Before that time it had been offered through a system of mentoring with admission to the profession regulated through examinations conducted by the professional association, the LAA. In university libraries, assistant librarians were expected to have a degree and to

then sit for the registration examinations while public librarians often took only the registration examinations. Many studied by correspondence with the assistance of colleagues in the workplace, some attended the three library schools which operated in at the state libraries in Sydney and Melbourne and the National Library in Canberra.

One of the major achievements of the national association lay in the transfer of professional education into universities and colleges because that step enhanced professional recognition, generated a stream of well-qualified librarians, provided opportunities for further professional development and expanded research and publishing in the field. A dual system of qualifications replaced the registration process: three- or four-year-long undergraduate degrees and generally one year long postgraduate diplomas. The latter have largely been replaced by master's degrees in recent years. Fine library and information science schools were established in many universities and were led by distinguished library educators such as Jean Whyte, John Balnaves and Margaret Trask. However, most of these schools found themselves in considerable difficulty and many closed in the face of changing university priorities from the late 1990s. Their reconstruction so that they may contribute to the renewal of an ageing professional workforce is now a major issue for the association and its members.

The profession in Australia has also benefited enormously from the association's championing of the education and recognition of library technicians, a paraprofessional element of the library workforce. Trained in technical colleges, library technicians have proven to be an innovation which has significantly enhanced the operation of libraries and information services.

Although the transfer of professional education into universities and colleges was a key stage in professionalization, the battle for professional recognition was not entirely won since salaries for librarians lagged behind those in other fields with comparable qualifications. The principle of wage parity was recognized when librarians at the State Library of New South Wales successfully argued their case although the resultant increase in salaries did not automatically flow onto those employed in other libraries.^[14]

International Influences

Professional leadership extended to many aspects of practice and participation in a wide range of international initiatives as well as those at a national level. They have included the technological innovations pioneered by such organizations as OCLC in the United States and the Joint Information Systems Committee in the United Kingdom. Frequent travelers, Australian librarians have participated in many international organizations and often visit overseas colleagues. Reciprocal visits to Australia are encouraged

and Australia has hosted all of the major international library congresses including those of the International Federation of Library Associations and Institutions, the International Association of Music Libraries and the International Association of Technological University Libraries. Australian librarians have served as presidents and senior officials in many such bodies as well as contributing to the work of specialist committees and projects.

Perhaps one of the most significant Australian contributions will prove to lie in the attempts of the profession to engage with the library, information and knowledge issues relating to Indigenous peoples. Work which started in Australia in the early 1990s^[15] has been both locally and internationally influential.^[16]

ARCHIVES AND ARCHIVAL SCIENCE

In the military and naval traditions to which they were accustomed, the authorities of the first settlements in New South Wales and Van Diemen's Land (now Tasmania) kept records of the progress of the new colony, including births and deaths, marriages, law cases, stores, arrival of ships and land grants. Because they were penal colonies, many of the early records concern the assignment of convicts, keeping of order and punishments. Similar patterns were followed as the other Australian colonies were established including the convict free settlements in South Australia and Western Australia. The records were transmitted to London so the principal early Australian records were located in repositories in the United Kingdom. They had to be copied in the twentieth century through the Australian Joint Copying Project, a major project of repatriating records which began in 1945.^[17] Nevertheless, the practice of record keeping was established early and maintained continuously with records offices established as each of the Australian colonies achieved responsible self-government.

National and State Archives

As for libraries, official archives in Australia are split between levels of government. The National Archives of Australia manages records at the federal level.^[18] However, the formalization of that responsibility came fairly late in Australia and its achievement was protracted. The first national archivist, Ian Maclean, was appointed in 1944 and served to 1968. During his term, the Director of Archival Management at the U.S. National Archives in Washington, T.R. Schellenberg, visited to propose in 1954 the establishment of national archives. Two decades later in 1974, W. Kaye Lamb, former Dominion Archivist of Canada, reaffirmed the need to take responsibility for government archives. His report was followed by the 1975 appointment of Robert Neale as the first Director-General

of the Australian Archives. He served until the Archives Act 1983 came into force, finally providing legislative assurance that Australia's national archives would be protected. Thanks to the commitment of his successors, including the long-serving George Nichols, the National Archives of Australia became a recognized national cultural institution and provided leadership especially in electronic recordkeeping.

Despite its long delayed establishment, the National Archives of Australia now enjoys major recognition for its high standards and has been able to guide Australian Government agencies to adopt good record keeping practice and to select and preserve the national archival collection. Under the Archives Act records in that collection that are over 30 years old are made publicly available, offering valuable insights to historians and the general public.

State records offices perform similar functions at the state and territory level. In South Australia, for instance, the State Records Act 1997, Freedom of Information Act 1991, and Information Privacy Principles provide the legal and regulatory framework for government recordkeeping including both state and local government records.^[19] The Director of State Records develops standards and issues guidelines relating to the management of official records, including their destruction with the approval of the State Records Council. Although provisions are similar, the ambit of legislation varies among the jurisdictions. In some states, local government authorities maintain their own archives.

The nexus between record keeping and transparency in government is well established in Australia although many, especially media organizations, object to the charges levied and restrictions imposed on access under freedom of information legislation.^[20] In most jurisdictions, ministers and sometimes public servants have wide powers to apply "conclusive certificates" which prevent the release of documents sought by investigators. In the absence of a constitutional right to information, Australians can only appeal to courts to order disclosure on the basis of public interest.

One of the most important achievements of the national and state archives in Australia resulted from the tragic events uncovered by the national inquiry into the forced removal of Indigenous children from their parents under eugenics policies.^[21] Included among its recommendations was the need for those who had been removed to access files relating to them and their families so that they could recover their history and reconnect with their families. Indigenous staff members have been employed by the archives to assist enquirers in obtaining access to sensitive and sometimes restricted records. The Indigenous access teams liaise with Indigenous support groups such as Link-up to ensure that counseling and support will be available to those who undergo such emotional experiences.^[22]

Similar, although usually much less traumatic, needs to discover "roots" drive much of the growing interest in

genealogical inquiry. Government archives in Australia are vital to such inquiry because they hold official migration and shipping records as well as records relating to births, marriages and deaths. Of particular interest are the records relating to transportation of convicts to some of the Australian colonies by British authorities. Once a source of considerable shame, today the identification of a convict ancestor can be welcomed because it identifies the family as early, if involuntary, settlers. Many of the records have been copied to microform or directories and sometimes digitized so that they may be consulted in state libraries and some larger public libraries as well as the libraries of genealogical associations.

Nongovernmental Archives

Universities, colleges and other public and private organizations including businesses, universities and associations generally maintain their own archives although those established by legislation, including universities and public corporations, are usually subject to the state records requirements of their jurisdiction which may include transfer of important records to the state authority. The Noel Butlin Archives Centre is a nationally significant collection of primary source material relating to business and labor which was established in 1953 at the ANU in Canberra. Holding the records of Australian companies, trade unions, employer and professional associations and industry bodies from the 1820s to the present, the Centre is named after Noel Butlin, the first Professor of Economic History at the ANU who began the collection.^[23]

Other significant archives include the Bob Hawke and John Curtin Prime Ministerial Libraries (modeled on the presidential libraries of the United States), the Reserve Bank of Australia Archives, the National Library of Australia manuscript collection and the very important records of Australians at war in the Australian War Memorial. Of particular interest is the Archives of the Benedictine Community of New Norcia which holds records of the missionary work of the monks at New Norcia near Perth and in the north of Western Australia.^[24] The material—in Spanish, Catalan, French, English, Italian and Latin—includes official correspondence with Rome, records of the abbey and town, and lexicographical work in the various Aboriginal languages of the districts in which the monks worked.

Another important initiative, especially because of Australia's strong record in science and technology, is the Australian Science and Technology Heritage Centre.^[25] It was established by the University of Melbourne in 1999 to continue the academic, research and heritage activities of the Australian Science Archives Project, started in 1985, to foster the preservation and promotion of the heritage of Australian science, technology and medicine. Its central Internet accessible resources are Bright Sparcs, which incorporates biographical and bibliographical details about

Australian scientists, and the Virtual Library for the History of Science, Technology and Medicine.

Among the technologies adopted early in Australia were photography, film, sound recording and radio. The National Film and Sound Archive (NFSA) was established in 1984 following a disagreement on the management of audiovisual resources within the National Library. Although the National Library continues to hold valuable audiovisual resources, responsibility for preserving those elements of the national documentary heritage rests with the NFSA which has been an independent statutory authority since July 1, 2008 and works in collaboration with producers such as Film Australia. *australianscreen* delivers online clips from Australian feature films, documentaries, TV programs, shorts, home movies, newsreels, advertisements, and sponsored films produced over the last 100 years.^[26]

Archival Science as a Discipline and Profession

The Australian Society of Archivists is the national professional association for archivists^[27] and the Records Management Association of Australia is the peak organization for records managers.^[28] Both provide opportunities for professional interaction through conferences and publications and guide standards and professional education. Several Australian universities offer courses in archives and records management usually via one year full-time graduate diploma. A master's degree normally requires an additional year of full-time study or original research. Interest in doctoral study is increasing.

At the institutional level, the Council of Australasian Archives and Records Authorities comprises the heads of the government archives authorities of Australia, New Zealand and each of the Australian states and territories.^[29] A key undertaking is its Australasian Digital Recordkeeping Initiative launched in 2004 to promote a single Australasian approach to digital public record-keeping across all jurisdictions and to pool resources and expertise to find better ways to ensure that digital records are preserved and made accessible for the future.^[30] It was sparked by a paper by the influential head of the Department of Prime Minister and Cabinet, Dr. Peter Shergold, "Digital amnesia: the danger in forgetting the future."^[31]

The Register of Australian Archives and Manuscripts is a guide to collections of personal papers and nongovernmental organizational records held by Australian libraries and archives.^[32] It succeeds the *Guide to Collections of Manuscripts Relating to Australia* which was published by the National Library of Australia from 1965 to 1995. It includes more than 37,000 records of collections of manuscript and archival material held in Australia, whether of Australian origin or not; photocopies or microfilms of Australian manuscript or archival material, including nongovernment overseas material relating directly to Australia; personal records held in government

archives; and single unpublished primary sources such as a letter, deed or diary. But it does not include government records, unpublished secondary sources, or material that is entirely in pictorial, video, cartographic, musical or sound formats.

MUSEUMS AND MUSEOLOGY

To an even greater extent than libraries, a central role for museums in Australia has been to present the cultures and heritage of the world to the citizens of a far-off land. The major galleries attempted to build representative, "study" collections of artists and art movements recognized to be significant in the metropolitan centers Europe. Many of the museums similarly presented world cultures and manufactures but many also strove from early times to build collections which would represent and enable study of the new land. Collection of biological and ethnographic objects began before colonization as navigators and naturalists took curiosities back to their metropolitan centers. However, Aboriginal peoples had already established keeping places in which important and sacred objects, such as the *tjurungas* of Central Australia were preserved.

For a nation established through colonization, the frontier of cultural contact is in many ways commemorated through material culture as Philip Jones has shown in his landmark study, *Ochre and Rust*.^[1] The adoption and adaptation of European materials and tools by Aboriginal peoples and sometimes the reciprocal use of Aboriginal technologies demonstrated the moveable and contested nature of the frontier. But it also highlights the changing perspectives of museology as artifacts, which were once considered to exemplify contamination of traditional Indigenous technology, are now seen to be evocative of cultures in collision. The embracing of Australia's Indigenous heritage and the contemporary vitality of Indigenous art and culture has been a major theme in the development of Australian museums and galleries.

National and State Museums and Galleries

The state art gallery of Victoria, entitled the National Gallery of Victoria (NGV) was established in 1861 and continues under that name, operating two major galleries, the NGV International which presents art from Europe, North America and Asia and the Ian Potter Centre: NGV Australia which shows Australian art, including many works by Indigenous artists. Benefiting enormously from the generous Felton Bequest in 1904, the NGV was enabled to construct an outstanding collection of Western art which fulfilled the mission of presenting world culture to the residents of the antipodes.^[33] The Art Gallery of New South Wales, in contrast, had to wait until the last decades of the twentieth century to develop its collections to a noteworthy standard, following the appointment of

Edmund Capon as Director in 1978.^[34] As an expert in Asian art, he has developed a major collection of Asian art as well as building the Indigenous and modern art collections. His flair for publicity has generated record attendances especially for major exhibitions including the populist annual Archibald Prize and visiting “blockbuster” exhibitions for which visitors queue for long periods. The Queensland Art Gallery’s has gained reputation and built its collections similarly by exploiting its flagship international art event, the “Asia-Pacific Triennial of Contemporary Art,” a series of exhibitions uniquely focusing on the contemporary art of Asia and the Pacific, including Australia.^[35]

Although the original city plan for Canberra included two galleries, typically for most of the museums and galleries at the truly national, federal level, the National Gallery of Australia, was only established in 1973, long after its state rivals.^[36] With federal government funding it built a significant study collection of international works, including controversially Jason Pollock’s *Blue Poles*, and a major collection of Australian Indigenous art.^[37] It developed a fully professional curatorial capacity which enabled it to solicit major exhibitions from overseas galleries with the risk underwritten through a federal government program now known as Art Indemnity Australia. Now complemented by other programs backed by state governments and extended to state and regional galleries and museums, this is a very necessary provision if precious

and sometimes fragile works are to be entrusted to the rigors of touring to and around a far-off continent.

In 1998, the National Gallery was complemented by the National Portrait Gallery, also in Canberra. It aims “to increase the understanding of the Australian people – their identity, history, creativity and culture – through portraiture.”^[38] Together with the major pictorial collections held by the National Library of Australia, a significant collection at the ANU, the works of war artists at the Australian War Memorial, a number of fine smaller private and public galleries and many practicing artists, these major galleries have made Australia’s “bush capital” a city of art which is promoted as destination for tourists with cultural interests. In doing that, Canberra has finally overcome the initial advantage of the state capitals although they—especially Melbourne, Sydney and Brisbane—continue to be major centers for art exhibition (Fig. 5).

Similar tardiness at the national level was evident in the creation of museums with the National Museum of Australia opening in Canberra only in 2001 although its enabling Act had been passed in 1980, it had been building collections for many decades and it had occupied temporary exhibition spaces for some years.^[39] The Australian National Maritime Museum, located in Sydney and opened in 1991, celebrates Australia’s maritime history and includes one of the world’s largest collections of floating vessels which can be visited.^[40]

Fig. 5 The innovative architecture and enticing public spaces at the Ian Potter Centre: NGV Australia at Federation Square, Melbourne (Photographer Alex Byrne).

The Australian War Memorial is an exception to the belated creation of museums and galleries at the national, federal level.^[41] Conceived in 1916 by the writer of the official history of Australia's participation in World War I, C.E.W. Bean, it was shaped by its first Director, Lieutenant Colonel J.L. Treloar, who occupied the position from 1920 to 1952. A wealth of resources for the researcher and lay person—records of military engagements, collections of war relics and depictions of battle—began to be collected in 1917. A temporary exhibition opened in Melbourne in 1922, moved to Sydney in 1925 and closed in 1935 with the permanent Memorial opening in Canberra in 1941 during World War II. The almost unique combination of memorial, museum, gallery and documentation centre commemorates Australia's long history of participation in international conflicts and peacekeeping operations and provides a major research facility.

The major state museums have tended to have a natural history and ethnographic focus. The oldest, the Australian Museum in Sydney, is an important research institution with specializations in taxonomy, anthropology and mineralogy. It was founded in 1827 when Earl Bathurst, Secretary of State for the Colonies, wrote on 30 March, to Lieutenant-General Darling, Governor of New South Wales, offering up to £200 per annum for "... the Government to afford its aid towards the formation of a Public Museum at New South Wales where it is stated that many rare and curious specimens of Natural History are to be

procured ..."^[42] It opened to the public in 1857 in its current location on College Street, Sydney and continues to attract strong attendances to visit both its continuing displays and special exhibitions including some imported "blockbusters" (Fig. 6).

Similar models were followed in other colonies and subsequently states and territories, some combining museum and art gallery, including Tasmania and the Northern Territory. Perhaps reflecting Australian pragmatism and the pressing need to understand the nature of the settlers' new country, curatorial traditions developed more quickly in regard to scientific priorities than art. In keeping with the belief that Australia's Indigenous peoples would disappear, ethnographic interest emphasized traditional cultures and technologies rather than those which were developing across the frontier of contact. The South Australian Museum in Adelaide has an especially rich collection of Aboriginal artifacts which have been represented in the outstanding Australian Aboriginal Cultures Gallery.^[43] Curated in consultation with traditional owners and with over 3000 items on display in an interactive setting, the Gallery exhibits the largest collection of Aboriginal artifacts and archival material in the world. It endeavors to tell the story of one of the world's oldest and most continuous cultures in a context which recognizes contemporary Indigenous life as well as traditional cultures and technologies. Although it retains the commitment to scientific rigor and public education, today's

Fig. 6 The floating collection of the Australian National Maritime Museum in Darling Harbour, Sydney (Photographer Alex Byrne).

South Australian Museum is a far cry from the original, somewhat dilettante, conception of a museum to satisfy intellectual pursuits such as literature, arts, history and natural science that had been proposed with the foundation of the South Australian Literary Association in London on August 29, 1834.

Other Museums, Galleries and Curated Environments

Museums and galleries proliferated during the nineteenth century as the Australian colonies developed and the immigrant population swelled. Especially after the discovery of gold in Victoria and later other areas, towns and cities grew and soon wanted a museum, gallery or combination. Many survive today and have been joined by new institutions established through local effort or specialist interest, often with government support in the form of establishment grants and, more rarely, continuing subventions. Australia has largely lacked the tradition of munificent philanthropy found in the United States because of its later settlement, much smaller population and lesser industrialization. Galleries and museums have consequently been unable to acquire overseas works on the scale of the major collections to be found in the United States. Many have nevertheless developed strong collections which increasingly focus on Australia and its broader region, including East and Southeast Asia and the Southwest Pacific.

Among the regional museums and galleries, the Bendigo Art Gallery has built on its colonial heritage to become a highly recognized gallery featuring a strong permanent collection and a stimulating program of locally curated and touring temporary exhibitions.^[44] Close by is the Bendigo Joss House which is managed by the local council in association the National Trust of Australia and continues to be used as a place of worship.^[45] The only surviving building of its kind in regional Victoria, it commemorates the influx of many Chinese sojourners during the gold rushes. Other properties classified and sometimes managed by the National Trust in and around Bendigo—including the Shamrock Hotel, Post Office and Castle-maine Market—reflect the wealth of the Victorian goldfields. Together with other museums, botanic gardens, national parks and many other curated attractions, this one regional city illustrates not only the widespread interest in and support for preservation and presentation but also the depth of curatorial capacity and expertise that is evident across Australia.

Specialist museums and galleries abound including the Powerhouse Museum in Sydney which was developed from the Museum of Arts and Sciences and has rich technological collections.^[46] The Museum of Sydney presents the history and archaeology of the first European settlement in Australia^[47] while the Sydney Jewish Museum commemorates the Holocaust as well as displaying the

culture and experiences of the Jewish migrants to Australia.^[48] Others extend from toys and photography to public transport and militaria. The large museums are complemented by smaller specialist museums, a variety of art galleries, many historic houses which can be visited, others that are heritage listed for preservation, and historic sites and precincts. Although as Australia's largest city Sydney is more richly endowed than many other localities, the variety is typical of that to be found in other cities and towns.

Many have taken advantage of new technologies to engage visitors and stimulate understanding interactively including the South Australian Museum presentation of Indigenous culture and technology. The Questacon, located in Canberra, is Australia's National Science & Technology Centre which promotes interest in science, especially by children, through quirky and exciting exhibits and the use of young explainers who take touring exhibitions and outreach programs across Australia.^[49]

The museums and galleries are joined by a range of other curated environments that includes zoos and botanical gardens, aquaria and national parks. The major botanical gardens trace their histories back to the colonial era when they were conceived partly as pleasure grounds and partly as scientific facilities which experimented with the acclimatization of exotic plants to the very different biogeography of Australia as well as the growing of native plants in controlled conditions and preparation of specimens for transmission to European herbaria, especially the famous Kew Gardens in London.

Zoos and aquaria also followed the European models until recent decades when they were influenced by the new open style developed at ZSL Whipsnade Zoo in the United Kingdom and elsewhere. Many are now focused on sustainable practices and the preservation of endangered indigenous and exotic species with strong scientific programs. Although most of the major facilities are to be found in capital cities, some such as the Taronga Western Plains Zoo near Dubbo, New South Wales, are located in rural areas (Fig. 7).

Scientific work and conservation is advanced through the extensive network of national parks across the vast landmass of Australia and stretching northwards to Christmas Island off Java and southwards to the Australian Antarctic territories.^[50] They include national parks within metropolitan boundaries, the Sydney Harbour National Park being an outstanding example, as well as relatively small parks surrounding geographical features, such as the Naracoorte Caves Conservation Park in South Australia, large tracts of significant landforms and vegetation, including the impressive Kakadu National Park in the Northern Territory, and marine parks, notably the Great Barrier Reef Marine Park which extends more than 2300 km from the tip of Cape York down the Queensland coast. Australia was early to recognize the importance of national parks with the establishment in 1879 of the Royal

Fig. 7 Powerful rock art at Nourlangie Rock in Kakadu National Park which has been added to the World Heritage List for reasons of both natural and cultural richness (Photographer Alex Byrne).

National Park just beyond the southern suburban fringe of Sydney, the world's second oldest national park after Yellowstone in the United States. However, widespread proclamation and the scientific management of national parks only occurred a century later, in the last decades of the twentieth century. Many are vital to the preservation of endangered native species of fauna and flora as well as sensitive landforms and a growing number is managed in collaboration with the traditional Indigenous owners of the land areas.

As in other developed countries, there are very many commercial, specialist and local museums, galleries and collections across Australia. Some are well curated, others amateurish. A vibrant art sector is reflected in the commercial galleries as well as private and institutional collections. Universities have built art collections, often including an Indigenous component, and some have museums that reflect their research fields such as the Nicholson and Macleay Museums at the University of Sydney and the Ronald and Catherine Berndt Museum at the University of Western Australia.

Museology

Early collectors included visiting scientists, explorers and pastoralists who often collected for donation or sale to museums in Europe or elsewhere. Their personal collections

frequently passed to the major public museums or were used to establish local museums and, in some cases university museums. Some found their way to the market for curiosities and many continue to be sold through the major auction houses.

From a museum perspective, almost certainly the most influential Australian collector was the botanist Baron Sir Ferdinand Jakob Heinrich von Mueller.^[51] His story is, in many ways, emblematic of a settler society bringing diverse traditions and seeking to understand a very different continent. It explains much about the development of Australian science and museology. Fiercely patriotic to his new country, Mueller was driven by scientific curiosity to investigate the flora of the colonies of South Australia, Victoria and other regions including remote North Australia and Papua. But he was also conscious of the need to develop viable industries and consequently looked for applications of Australian flora as well as the acclimatization of exotic plants. At a time in which settlers tended to look to known European agronomy, Mueller identified uses of Australian plants for medicinal and commercial purposes and was responsible for exporting eucalyptus seeds to California, India, Algeria, Hong Kong and elsewhere as a measure to combat malaria, an initiative which has had global impact. In his later years, his preoccupations extended to the promotion of the exploration of New Guinea and Antarctica.

After emigrating from Germany to Adelaide at the end of 1847, Mueller investigated the South Australian flora and contributed papers to the Linnean Society in London, the German *Linnea* and Adelaide newspapers. Moving to Melbourne in 1852, he was appointed Victorian government botanist in 1853. His initial explorations and collection of specimens added new genera to the flora of Australia. As botanist with A. C. Gregory's North Australian Exploring Expedition in 1855–1857, he observed nearly 2000 species, including some 800 not previously identified in Australia. Appointed director of the Botanical Gardens in Melbourne, Mueller developed a herbarium and prepared his *Fragmenta Phytographiae Australiae* published in twelve parts 1858–1882. He had long hoped to write a flora of Australia and had compiled much material towards it, but with extreme reluctance was compelled to assist George Bentham in preparing *Flora Australiensis* 1863–1878. The tension between science and the creation of public pleasure grounds led to Mueller's dismissal from the directorship of the botanic garden in 1873 since "no foundations exist . . . neither are statues erected . . . works of art we can call forth at pleasure, while time lost in forming the plantations cannot be regained." Despite that major disappointment, he continued his scientific investigations as government botanist, dying in 1896 just before the Australian colonies federated.

As Mueller's career and extraordinary achievements demonstrate, Australian museology was scientifically focused and internationally linked from the outset. Although some of the motivation for establishment of the early museums derived from the desire to demonstrate that the colonies were becoming civilized, as it did for the colonial public libraries, a major impetus came from curiosity about the settlers' new land. Unlike the galleries which tended to emphasize education and the fostering of intellectual life through the presentation of civilization to the residents of distant colonies, the museums collected and exhibited the flora, fauna, geology, ethnography and developing manufactures of those colonies and surrounding regions, especially in the Southwest Pacific.

Museology is well developed as a discipline and profession in Australia with active professional associations and a range of professional educational options. Museums Australia is the national organization for the museums sector.^[52] It promotes development of the museum sector, articulates ethical standards, facilitates training and raises public awareness. Many other associations represent more specific interests. At the institutional level, the major organizations are the Cultural Collections Council of Australia, Council of Australian Museum Directors and Council of Australian Art Museum Directors.

Courses range from those more focused on the technical aspects to those that emerge from scientific disciplines or ethnographic and cultural studies.^[53] Australian universities which provide cultural and museum studies courses

include Deakin, Macquarie, Western Sydney, Sydney, Curtin and the ANU.

Key Contemporary Issues

The international links forged in the early days of Australian curatorial practice continue. Australian museums and their staff are active participants in the major international organizations dealing with curatorial issues, especially the International Council of Museums and the International Council on Museums and Sites. They have vigorously supported UNESCO sponsored initiatives such as the World Heritage List on which are inscribed many natural areas—such as the Australian Fossil Mammal Sites at Riversleigh and Naracoorte (1994), Gondwana Rainforests (1986) and Great Barrier Reef (1981), some cultural areas—Melbourne's Royal Exhibition Building and Carlton Gardens (2004) and the Sydney Opera House (2007)—and areas meeting both criteria—such as Kakadu National Park (1981).

The handling of Indigenous material culture and art has long been a major issue for Australian museums and galleries.^[54] Curators have developed considerable understanding of the proper ways to manage both the collections built up since the early days of settlement and contemporary cultural expression. Most work closely with relevant Indigenous organizations and communities to ensure effective consultation and, where possible, engagement with curation. Some have established "keeping places" to which cultural objects, particularly those of a secret or sacred nature, may be returned for safekeeping under appropriate cultural conditions while still being preserved from deterioration. Concerns about the treatment of human remains no longer surface in Australia but Australian curators continue to work with Indigenous peoples to recover those still held in overseas museums, resulting in periodic successful negotiation for return for burial with appropriate ceremony.

International recognition of contemporary Australian Indigenous art over recent decades has led to its inclusion in all major Australian galleries, many galleries in other countries and many other public and private collections in Australia and overseas. The opening of the Musée du Quai Branly in Paris in 2006 was a signal of that recognition: not only were Australian Aboriginal artworks included in the collection but Aboriginal artists contributed to the decoration of the museum itself.^[55] While this has been criticized as a manifestation of exoticism, it has forcefully demonstrated that Indigenous art is no longer considered to be of ethnographic interest only but it is now seen as expression of continuing cultural traditions.

CONCLUSION

Over the century since Australia became a nation, its memory institutions and their practitioners have drawn on

the professional dispositions brought by settlers and the much older Indigenous traditional knowledge to develop distinctive patterns of practice. Globally linked and technologically proficient, their standards conform to international models of good practice and sometimes lead the way.

The particular challenges posed by distance within a very large country and distance from major centers of curatorial practice and the opportunities offered by an advanced economy have enabled Australia's museologists, archivists and librarians to gain reputations as "early adopters" and innovators. The development of the institutions and the modes of practice have been shaped by those challenges and by the competitiveness inherent in a federation. That has now largely been replaced by cooperation and a degree of convergence which is expressed through the Cultural Collections Council of Australia and in other forums.

The memory institutions have been central to the development of a new multicultural national identity which celebrates both the ancient Indigenous knowledge systems and those brought by visitors and settlers since 1788. Not uncontested, that identity is developing its own shape through reconciliation with Indigenous Australians, celebration of the diversity of modern Australia and recognition of the particular needs and challenges of the "wide brown land."

Australian Library and Information Association, Deakin, Australian Capital Territory, Australia

Abstract

The Australian Library and Information Association (ALIA) is the professional association for the Australian library and information services sector. It seeks to empower the profession in the development, promotion and delivery of quality library and information services to the nation, through leadership, advocacy, and mutual support. The ALIA represents the interest of 6000 members, the profession and Australia's 12 million library users.

The objects of the Association are listed in its constitution. They are

- To promote the free flow of information and ideas in the interest of all Australians and a thriving culture, economy, and democracy.
- To promote and improve the services provided by all kinds of library and information agencies.
- To ensure the high standard of personnel engaged in information provision and foster their professional interests and aspirations.
- To represent the interests of members to governments, other organizations, and the community.
- To encourage people to contribute to the improvement of library and information services through support and membership of the association.

INTRODUCTION

The Australian Library and Information Association (ALIA) is the professional organization for the Australian library and information services sector. It seeks to empower the profession in the development, promotion and delivery of quality library, and information services to the nation, through leadership, advocacy, and mutual support (Fig. 1).

The Association is governed by a Constitution and is guided by a vision, mission, objects, and values. Our policy statements are developed by an elected Board of Directors and implemented by the ALIA National Office.

The Association's Web site is <http://www.alia.org.au>.

HISTORY OF THE ASSOCIATION

In 1937, the Australian Institute of Librarians (AIL) was formed as a result of the Munn-Pitt survey of public libraries, the work of John Metcalfe, principal librarian of the Public Library (now the State Library) of New South Wales, and the support of the Carnegie Corporation, in the United States, which was also providing financial support for the Free Library Movement in Australia. Metcalfe introduced a national system of examining and certifying librarians, under the auspices of the new organization. This met one of the principle aims of the AIL: improvement in the professional education and status of librarians.

The Institute supported at every opportunity the appointment of librarians to professional positions in libraries.

Carnegie and British Council grants helped the postwar development of the Institute. A Carnegie grant enabled the launching of the Institute's professional periodical, the *Australian Library Journal*, in 1951. The Institute expanded its professional activities to include conferences, more publications, and surveys of library needs, particularly the expansion of public library services. In 1949, the Institute changed its name to the Library Association of Australia (LAA).

From 1944 until 1980, the Association's board of examiners set the syllabus and examined candidates for the LAA's professional registration examinations. From 1961, when the LAA recognized the course of the first Australian School of Librarianship at the University of New South Wales, the Association gradually moved from providing professional education to setting and monitoring its standards. The LAA developed a system for the recognition of tertiary-level courses, which gradually superseded the Association's registration qualifications.

In the 1960s, the LAA also articulated the need for specialist training for archivists, teacher-librarians, and library technicians. Courses for archivists and teacher-librarians were established through the 1960s and 1970s in universities and colleges of advanced education, which later became universities. The Association passed responsibility for course recognition for archivists to the Australian Society of Archivists in the 1980s.

Australian Library and Information Association

Fig. 1 ALIA logo.

The Association played a major part, in the 1970s, in formalizing an educational and career structure for library technicians within the library and information sector. Library technicians deal with library processes, such as acquisition, cataloging, circulation, interlibrary lending, and simple reference queries. At a senior level, they review operating procedures, evaluate equipment, assist in promotional programs, and supervise staff. The Association established a benchmark for standards that enabled all members of the sector to compare library technician qualifications nationally. The Association also created a section for the technicians and an annual award for achievement.

Features of the Association's work in the 1970s included the promotion of federal government funding for libraries and the encouragement of special interest groups within the Association, including a strong interest in the growing computerization of and networking opportunities for library and information services.

In 1989, recognizing the development of librarians as information providers and managers, the Association changed its name to the Australian Library and Information Association. After much discussion the Association created a permanent office in Canberra, the national capital of Australia. The ALIA House was opened in November 1990.

In 2000, the Association was incorporated as a public company limited by guarantee.

The Australian Library and Information Association has joined with other like-minded member organizations, such as National and State Libraries Australasia, the Australian School Library Association, Council of Australian

University Librarians and Public Libraries Australia to present a united front in advocating on behalf of our profession. Developing international relations is also part of ALIA's agenda, especially in light of Brisbane being selected to host the International Federation of Library Associations and Institutions 2010 World Library and Information Congress.

The year 2007 marked ALIA's 70th anniversary since the establishment of the AIL. As a membership organization, ALIA continues to focus on high level customer service in every part of its business. With close to 6000 members, ALIA provides a wide range of services for those in the library and information services sector.

CONSTITUTION

The Australian Library and Information Association is incorporated under Australian Corporation Law and operates predominantly for the promotion, development, and attainment of its Objects. It is a not-for-profit organization. The Objects as set down in the constitution are

1. To promote the free flow of information and ideas in the interest of all Australians and a thriving culture, economy, and democracy.
2. to promote and improve the services provided by all kinds of library and information agencies.
3. to ensure the high standard of personnel engaged in information provision and foster their professional interests and aspirations.
4. to represent the interests of members to governments, other organizations and the community.
5. to encourage people to contribute to the improvement of library and information services through support and membership of the Association.

ALIA CORE VALUES

A thriving culture, economy, and democracy requires the free flow of information and ideas. Fundamental to that free flow of information and ideas are Australia's library and information services. They are a legacy to each generation, conveying the knowledge of the past and the promise of the future.

Library and information service professionals therefore commit themselves to the following core values of their profession: promotion of the free flow of information and ideas through open access to recorded knowledge, information, and creative works; connection of people to ideas; commitment to literacy, information literacy and learning; respect for the diversity and individuality of all people; preservation of the human record; excellence in professional service to our communities; and partnerships to advance these values.

GOVERNANCE AND STRUCTURE

The Association is governed by a Board of Directors. The ALIA Board of Directors is the elected policy-making body of the Association. There are eight members of the Board, seven of whom are elected: the president, the vice-president, and five elected directors.

The President, Vice-President and four Directors are elected by the membership at large; one Director is elected by institutional members. The ALIA Executive Director is the eighth (non-voting) member of the Board.

All voting directors must be personal members and represent the interests of the organization as a whole, rather than those of a particular constituency. Terms of office are for 2 years with a maximum of two consecutive terms.

Standing Committees are formed by the Board to advise it on key priority areas. Current Committees include: the Governance Standing Committee; Finance, Audit and Risk Management Standing Committee; Education and Professional Development Standing Committee; Membership and Awards Standing Committee; and the Research and Publishing Standing Committee.

There are 10 Advisory Committees whose members are endorsed by the Board. These committees provide expert advice in areas such as copyright and intellectual property, online content regulation, interlibrary lending, research, public libraries, special libraries, new generation issues, and TAFE (Technical and Further Education).

A National Advisory Congress is convened each year to provide members with the opportunity to participate in discussion on policy, planning and any topical issues relevant to the Association. An ALIA Board Director facilitates each of the regional meetings, with a national meeting convened that includes regional representatives.

Groups and committees within the Association provide a focus for communication and participation for members. There are over 50 endorsed self-nominating ALIA groups that are based on states, regions, sectors, and special interests. Groups run a wide variety of activities ranging from e-lists, networking, and social activities, through to professional development events, workshops, and symposiums.

The Association is supported by a national secretariat based in ALIA House in the nation's capital, Canberra.

ADVOCACY

The Australian Library and Information Association undertakes an active advocacy role supporting the objects and core values of the Association in a wide range of forums both nationally and internationally. The Australian Library and Information Association contributes to and participates in Commonwealth, State, and Territory government committees and inquiries, writing submissions, media releases, and lobbying. The main issues for advocacy include information access, online content regulation,

national broadband strategy, copyright, privacy, and government information.

The Australian Library and Information Association supports programs encouraging wide ranging community engagement, and providing the opportunity to promote the role and value of libraries, and library and information professionals. The public campaigns include Library Lovers Day, Library and Information Week, Information Awareness Month, and National Simultaneous Storytime. The Australian Library and Information Association also organizes the annual Summer Reading Club, with libraries across the nation holding a range of events aimed at enticing the public, especially children, to make use of the services available in libraries over the summer months.

EDUCATION AND TRAINING: EDUCATION STANDARDS

The Australian Library and Information Association sets and maintains standards for entry into the library and information profession in Australia through ALIA's course recognition program. It plays a vital role in ensuring that education for the profession produces graduates who have the ability to provide excellent library and information services to benefit the nation and individual clients and who can respond to and meet the ever-changing information needs of a dynamic society.

The Australian Library and Information Association works collaboratively with educators and training providers, employers, and practitioners to promote the development and continuous improvement of courses in library and information management. Initial education should prepare library and information graduates who can achieve excellence in practice.

Library and information professionals have a responsibility to commit to professional development and career-long learning. Similarly, their employers and the ALIA have a responsibility to provide opportunities which enable library and information professionals to maintain excellent service delivery.

The Association's commitment to its members achieving their career goals is demonstrated by providing mechanisms which enable members to plan and undertake learning and other development activities; offering a mentoring program to assist members in their ongoing professional development; organizing partnerships with other professional and training organizations to make available learning activities and opportunities in library and information management and other disciplinary studies; formally recognizing members who participate in ALIA's professional development scheme; facilitating forums where knowledge can be created, shared, and disseminated to enable members to better understand the dynamic environment in which they, as library and information professionals, and their clients operate.

The ALIA Professional Development Scheme enables ALIA members to accumulate Professional Development (PD) points which provides recognition of ongoing learning through the use of the Certified Practitioner (CP) post-nominal.

MEMBERSHIP

Membership of ALIA is open to individuals and organizations. The only membership requirement is an interest in the sector.

Membership of ALIA entitles members to a wide range of benefits, free publications, online services, and discounts on conferences. Members of ALIA can belong to as many ALIA interest groups as they wish. The membership year runs from 1 July to 30 June.

Associate members hold an ALIA-recognized library and information science qualification at under-graduate or post-graduate levels. They are entitled to use the post-nominal letters AALIA while a financial member of ALIA. They are also entitled to membership of the professional development scheme. Graduates in the allied fields of records management, archives, and computing studies whose qualifications are recognized by their professional body may be admitted to associate membership. They may then use the post-nominals: AALIA(RecMan), AALIA(Arch) or AALIA(CS), respectively.

Library technician members hold an ALIA-recognized library technician qualification. A library technician member is entitled to use the post-nominal letters ALIATec while a financial member of the Association. They are also entitled to membership of the professional development scheme.

Associate fellow members have to demonstrate current professional or technical knowledge and skills. To qualify for Associate fellow, the applicant must demonstrate a minimum of 5 years associate or library technician membership of ALIA; continuity of participation in the professional development scheme and compliance for at least the previous 5 years; and current employment in the Australian library and information sector or an allied sector. Associate fellows may use the post-nominal AFALIA or AFALIATec.

Students and retirees also have membership categories.

Institutional members of ALIA have the right to vote in ALIA elections and to take advantage of the many benefits offered—both core services and “value-adding”. A nominated institutional representative holds the formal right to vote. There are six grades of institutional membership based on the non-salary budget of the library and information service within the institution.

AWARDS AND SCHOLARSHIPS

The Australian Library and Information Association awards, at the national and group level, are presented

each year to reward members of the library and information community and to celebrate their achievements.

Premier peer-nominated awards include: the HCL Anderson Award honoring outstanding achievement within the library and information sector by an Associate member; Redmond Barry Award honoring outstanding contribution to the library and information sector by an individual not eligible for associate membership; and the Ellinor Archer Pioneer award recognizing pioneering in new areas of library and information science by an individual or institutional member.

The ALIA Fellowships recognize the attainment of an exceptionally high standard of proficiency in library and information science and a distinguished contribution to the theory and practice of library and information science.

Research awards include: Study Grant; Dunn & Wilson Scholarship; Ray Choate Scholarship; YBP/Lindsay & Croft Research Award for Collection Services; and Twila Ann Janssen Herr Research Award for Disability Service. Excellence is recognized by the ALIA Excellence Award and the Metcalfe Award. Other awards include Aurora Scholarship, student awards, merit awards, Letters of Recognition, group-based awards, and a silver pin for recognizing volunteers who serve five terms on ALIA committees.

COPYRIGHT ADVICE SERVICE

The Australian Library and Information Association supports balanced copyright and related laws that advance the interests of society as a whole. The ALIA's Copyright and Intellectual Property Advisory Committee monitors copyright and intellectual property policy and legislative developments of interest to members and advises the Board of Directors on these matters. The Australian Library and Information Association is also a member of the Australian Libraries' Copyright Committee and the Australian Digital Alliance.

The ALIA's Copyright Service provides members with up-to-date information on copyright and how it affects the library and information sector. The service responds to members' queries about implementing their obligations under copyright and intellectual property law.

INDUSTRIAL RELATIONS ADVICE SERVICE

The Australian Library and Information Association provides a range of industrial and employment services and support including an online list of job vacancies, current salary rates, information on changes to industrial relations laws, library workforce data, rights and obligations when facing redundancy, etc.

INTERLIBRARY LOAN VOUCHER SCHEME

The Australian Library and Information Association operates an interlibrary lending voucher system, with vouchers used by libraries as payment for interlibrary loans, photocopies or microform copies made for retention by another library. The scheme was introduced to provide a simple and secure form of interlibrary currency with a minimum of record-keeping.

CONFERENCES

The Australian Library and Information Association's conferences provide professional development opportunities, promote excellence in practice, provide networking opportunities, promote research and innovative use of technologies, and build relationships with sector trade organizations.

Major conferences include the ALIA Biennial Conference, ALIA Information Online Conference, National Library and Information Technicians Conference, and the New Librarians Symposium. A number of annual symposiums, conferences, and workshops are organized by ALIA groups.

PUBLICATIONS

The Australian Library and Information Association's publishing program relates directly to ALIA's mission and values. The publishing program facilitates the flow of information and ideas as part of ALIA's engagement with members, the wider library sector, and the Australian community.

aliaNEWS is a free monthly e-newsletter available to any person interested in ALIA and the library and information sector.

The Australian Library Journal began in 1951. Published quarterly, it contains a wide coverage of Australian library issues ranging from ongoing research to day-to-day news from the workplace. It is the acknowledged flagship publication of the ALIA, and an appropriate vehicle for publishers, suppliers, and agencies wishing to reach the decision-makers. The journal is available through subscription.

Australian Academic and Research Libraries is a quarterly journal devoted to all aspects of librarianship in university and college libraries, including the TAFE sector, and in research libraries of all types. It publishes original, refereed contributions on all aspects of librarianship past and present, pure and applied bibliography, publishing, information science, and related subjects. All articles appearing in *AARL* are fully peer-refereed.

inCite is the premier news magazine for the library and information sector in Australia. Published monthly, it is distributed to all ALIA members and to subscribers around the world.

Other ALIA publications include ALIA's *Annual report*, *Australian Dictionary of Acronyms and Abbreviations*, and *Uniting a Profession: The Australian Institute of Librarians 1937–1949*.

CONCLUSION

The Australian Library and Information Association is the professional organization for the Australian library and information services sector. The Australian Library and Information Association celebrated its 70th anniversary in 2007. The Association is governed by a Constitution and an elected Board of Directors. The National Office is based in the nation's capital, Canberra.

The Australian Library and Information Association focuses on providing high quality services for its members and for the library and information profession in Australia, including national conferences, publications, copyright and industrial relations advice, a professional development scheme, an awards program, e-lists to facilitate communication, and support for over 50 self-nominating groups across the country. Through its course recognition process, ALIA ensures high educational standards for graduates of ALIA-recognized courses.

The Australian Library and Information Association's advocacy focuses on promoting the value of libraries and information services in ensuring the free flow of information and ideas in the interest of a thriving democracy, culture, and economy.

Authentication and Authorization

David Millman

Academic Information Systems, Columbia University, New York, U.S.A.

Abstract

Information systems security, access management, and privacy are normally understood through the processes of authentication and authorization. This entry provides a brief historical context and then describes several methods of authentication, such as passwords, digital signatures, network topology, smart cards, biometrics, and public key cryptography. It also discusses the most popular methods of authorization, including mandatory, discretionary, and role-based access control.

AUTHENTICATION

Authentication is the process of validating an assertion of identity. It normally involves the assertion of identity by an entity to a computer system and the procedures followed by that system to assess the truth of the assertion (i.e., whether the entity is who it claims to be). An entity may be an individual person, or it may be an organization, an account, a document, a device, or another computer system. Typically, an individual supplies an identity code and a password, as confirmation of the identity, to a computer system to gain access to services associated with that system. The establishment of identity does not necessarily result in access to services. Decisions concerning what level of access is permitted, and to which services, is made by an authorization process, described below, which may be entirely independent from authentication.

Authentication mechanisms must validate identity, protect against disclosure of secure information used to establish identity, and provide nonrepudiation—that is, preventing retraction or denial of an identity assertion. The level of confidence in an identity depends on the type of authentication and on the procedures used to implement it. These vary widely. Higher levels of trust usually require additional administrative and technical complexity. Ideally, authentication methods and implementation procedures are chosen to guarantee a level of confidence appropriate to the situation. For example, impersonation of identity may pose a higher risk in military or medical systems than it would in other cases.^[1]

Well into the 1980s, most computer systems served a small community exclusively. Establishment of individual identity was often a direct personal transaction with a system administrator. The principle methods for accessing a computer system were either through a device directly connected to the computer, such as a punch card reader, or over a communications network in which each device had a unique wiring path to the computer (i.e., wires were not

shared). Compromising someone's identity by tapping the correct set of wires was relatively inconvenient. Subsequent developments in communications technology and systems architecture have had an important impact on the requirements and characteristics of authentication infrastructures.

The introduction of shared networks and distributed system architectures, beginning in the 1970s, encouraged the decentralization of services and administration. Authentication became a distinct network service, an intermediary between a community of individuals and an assortment of other services on the network.^[2] Services such as e-mail, printing, and file sharing could be obtained independently from numerous distinct devices attached to the network. Individuals' workstations were attached to the network in the same way. Authentication transactions occurred frequently among an individual's workstation, the authentication service, and the destination services. The shared network architecture also made it possible for any device attached to the network to examine all traffic that passed across the network, making spying much easier. Today's Internet uses a similar distributed architecture.

An authentication service is an arrangement between a community of individuals and an administrative organization in a position to verify their identities. The scope and characteristics of the community served by an authentication authority therefore becomes an important consideration in distributed architectures generally, and in the Internet in particular. Individuals may perform a wide variety of activities on the Internet and may be considered members of many separate communities of use, such as those who are employed by a particular company or those who purchase products from a particular retailer. It is not currently practical or desirable for a single authentication service to manage the identities of all communities and as independent services proliferate it will become increasingly cumbersome for an individual to authenticate his or her identity separately with each distinct service to which access is desired.

Methods of Authentication

Authentication methods for individuals fall into three broad classes: those based on what one knows (e.g., a password); those based on what one possesses (e.g., a “smart card”); and those based on what one is (e.g., a fingerprint).

Shared secrets

Authentication that depends on the use of shared secrets is by far the most widespread. In this type of authentication, the individual and the system responsible for validating the individual’s identity share a common piece of information, the secret, often a string of characters commonly called a password. In the simplest systems, after someone transmits an identity code and password, the system checks an internal table and, if a match is found, the system authenticates the person for whatever access is deemed appropriate by the authorization process.

Such password-based schemes have several difficulties. Passwords may be stolen by observing the traffic on the communications lines or by simply looking over someone’s shoulder. Passwords may be shared explicitly. Passwords may be discovered by, for example, programmatically trying every word in a dictionary. Choosing passwords well (e.g., selecting nondictionary words) and changing them often improves security somewhat.

The Kerberos authentication service was an important improvement in password-based shared secret methods.^[3] Kerberos was developed at the Massachusetts Institute of Technology and first used there in 1986. It takes advantage of the ability of an individual’s workstation to perform cryptographic processing. When using Kerberos, a password is transmitted across the network encrypted, only once, to retrieve what is referred to as a ticket. The ticket is itself largely encrypted and can be used as proof of authentication for a fixed interval—perhaps for several hours—to obtain access to other services on the network.

Kerberos uses a central administrative authority service to perform the initial authentication and also to establish secondary tickets for each network service the individual uses. The set of services and individuals listed in the central administrative database are called a Kerberos realm. Kerberos first made common the use of a single authority over a set of highly distributed entities and remains an important contribution.

One-time passwords

The security of passwords is substantially improved when a password is changed after each time it is used. In one such scheme, the individual and the authenticating system arrange for a quantity of perhaps 1000 passwords in advance.^[4] Each time a password is used it is discarded, the next password on the list is used for the next authentication, and so on.

In a variant method, the correct password changes as a function of the time, changing each minute, for example.^[5] The individual possesses a small device, the size of a credit card, that continually calculates and displays the current correct password. The authenticating system validates identity through software that performs the same calculations.

Another method is based on the individual and the authenticating system having knowledge of numerous shared secrets, which are ideally chosen so that only the individual is likely to know them all, such as a favorite color, childhood address, friend’s birthday, etc.^[6] For each authentication, the system challenges the individual to confirm a random subset of the secrets, asked in a random order. This method is interesting because it combines properties of both shared secrets and one-time passwords. Each authentication is somewhat unpredictable, and the individual does not need to possess a list or a device to answer the questions.

Public key encryption

Public key refers to an encryption technology based on the mathematical properties of two carefully chosen numbers. The numbers are chosen so that they are inverses of each other: information encrypted with one number may be decrypted only with the other, and vice versa. The numbers are also chosen so that knowing one of them gives no clue to what the other is. One number is designated the private (or secret) key, the other the public key. The private key is never divulged; the public key is distributed widely.

An individual may encrypt information with their private key. Anyone who possesses the corresponding public key may decrypt the encrypted information and may further infer that the information must have originated with the individual. Similarly, information encrypted by anyone using the individual’s public key can only be decrypted by the individual, using the private key. This elegant mechanism reduces the task of authentication to simply decrypting an arbitrary encrypted transmission with the individual’s public key, because only that individual could have created it.^[7]

Authentication systems built on public key methods are largely concerned with the administrative procedures needed to ensure that the system possesses the correct public key in the first place, and that the private key has not been divulged. Some of these procedures are discussed below.

Smart cards

A smart card, or smart token, is a small computer with low power requirements, making it appropriate for uses that require portability.^[8,9] The computer is usually embedded in a plastic card the size of a credit card, but objects such

as rings and buttons are also used. They are designed to protect the information stored within them both by performing only specific, well-defined communications and by employing safeguards against physical tampering.

For authentication, smart cards are especially useful for storing a private key and for performing the computations needed to encrypt or decrypt information using that key. This enables public/private key authentication to be performed with the private key never leaving the smart card.

Often, smart cards have security features that enable it to verify the identity of the possessor of the card. The card itself thus engages in an authentication process with the possessor—most often using a simple password or “PIN”—before performing further operations.

Smart cards may communicate through physical contact with another device, such as a conventional computer, a telephone, or a satellite receiver, or they may communicate by radio contact within a short distance (a few inches) of a device, as do the proximity cards used to gain access to a building or a mass transit system. It is interesting to note that possession of a smart card does not imply possession of the information stored within it. In most existing implementations, the issuer of the card controls this information.

Biometric

A biometric method of authentication identifies an individual through personal physical characteristics. Biometric systems exist for analysis of fingerprints, handprints, voices, faces, and patterns in the iris and retinal blood vessels of the eye. Details of these methods vary widely, with a corresponding variance in accuracy and efficiency. There are few standards in place.^[10]

These systems compare the characteristics presented by an individual with a database of those previously stored. In the context of authentication, an individual asserts a claim of identity and uses the biometric as supporting evidence. Biometrics are also used to discover an unknown identity by searching through the database of characteristics. The latter method is common in, for example, law enforcement.

Related to biometric methods are those that measure the characteristics of an individual's performance of an action, for example, systems that measure the pressure, direction, and rate of a stylus when a person signs their name; such systems are considered to be relatively reliable. In another method, identification can be determined by the latency pattern of keystrokes, the speed and timing with which the keys are struck, when an individual types a particular phrase on a keyboard.^[11] Robust biometric systems can prove the most reliable, nonforgeable means of authentication, assuming the individual has the body part being measured, but they have come under criticism for their invasive nature and for privacy concerns.

Other kinds of authentication

The most effective forms of authentication probably use a combination of several of the methods described above. For example, using a biometric means to authenticate an individual's identity to a smart card, and then using the card to perform further authentication for some fixed period of time is a relatively secure and convenient scheme.^[12] Smart cards with fingerprint sensors are currently available. Choosing the appropriate combination of authentication methods requires a careful analysis of the requirements and risks of the environment.

Authentication increasingly happens between entities in which neither party is an individual person. All the methods above, except for biometrics, may be used for an organization's accounts, and for hardware and software systems.

Between computer systems on the Internet, a popular form of mutual authentication relies on the correspondence of identification with network addresses (Internet Protocol or IP addresses). In other words, one system authenticates to another only by virtue of its topological location in the network. Reliance on particular network addresses is increasingly unreliable as networks are growing and changing quickly and as services are becoming increasingly distributed.^[13]

Digital Signatures

Authentication as discussed so far has been in the context of a transaction between two entities. Another important form of authentication is with respect to digital documents or other digital objects. The goals are the same—to ensure identity, integrity, and nonrepudiation—but in this case it applies to a set of fixed data. Authentication of this type is commonly called a digital signature.

Public key methods provide a natural foundation for digital signatures. Data encrypted with someone's private key are in some sense “signed” by that person. Although anyone may decrypt these data using the corresponding public key, only the holder of the private key can have created it.

More typically, however, it is desirable to separate the data from the signature so that decryption is only required when signature verification is required. In this case, a *characteristic function* (also called a *message digest function*) is used. A characteristic function of a particular block of data has two properties: it is significantly smaller than the original data, and no other data will generate the same characteristic function. Thus, it can be considered a unique “fingerprint” of the original data. Encrypting this fingerprint with the private key creates a signature that may be attached to the original data. The data may be verified by recomputing its characteristic function, decrypting the signature with the public key to obtain the

original characteristic function and comparing them to see if they match.

Process and Authority

In many of the methods discussed above, the individual or entity presents some form of authenticating information to a system that performs the authentication by comparing the presented information with information stored internally, perhaps after some computation. The internally stored information must be established by an initialization process.

Initialization processes vary widely, becoming more complex depending on the degree of trust required in the identity thus established and on the risk involved in impersonation. If the risk is considered relatively low, as it is with many free services on the Internet, initial identity may be established simply by requesting it in the course of first using the service. If the risk is considered to be greater, independent confirmation of identity, as by transmitting a copy of a government-issued identity document or by appearing in person with such documents before an official of the authenticating organization, may be required.

These kinds of procedures parallel conventional methods for confirming identity. Once identity is established, the authentication methods described above are used for ongoing access. When identity is compromised, for example, by a stolen password or private key, all or part of the initialization process normally needs to be repeated.

Public key systems present an additional challenge to the initialization process. Public keys may be distributed widely, to any entity to which one wants to send encrypted information, but it is impractical to engage in an identity initialization transaction with every other entity who may want to decrypt or authenticate using the public key. There are two popular methods employed to solve the problem of distributing public keys: ITU-T international standard X.509 certificates^[14] and PGP (Pretty Good Privacy).^[15–17]

X.509 relies on formalized Certificate Authorities (CA), who are responsible for asserting that a particular public key corresponds to a particular entity. In this scheme, an entity engages in an identity initialization process with a CA, resulting in a digital document containing the name of the entity and its public key; this document is digitally signed, as above, by the CA. Such a document is known as a digital certificate. Subsequently, the entity uses this certificate, rather than the public key alone, for authentication transactions because the certificate carries the assertion and trust-risk value of the CA. In other words, the CA's digital signature represents a measure of due diligence in confirming the correspondence between the individual's identity and the public key. Additional information may also be carried in the certificate, usually relating to the nature of the original identity initialization,

the purposes for which identity has been assured, and the level of trust in the identity.

The CAs themselves possess certificates, which may be signed by a higher order CA. The higher order CA assures the correspondence of the lower order CA and its public key, as above, and also asserts that the lower order CA has appropriate policies and procedures to issue trusted certificates. The higher order CA may also have a certificate signed by an even higher CA; this process can continue through many levels of authority until reaching an ultimate or "root" authority, who signs its own certificate. In current practice, there exist many root authorities, and the number of levels between a root and an end entity (e.g., an individual) is usually small (less than five).

In addition to policy relationships that may be established by hierarchies of certificate authority, there may also exist "bridge" CAs, who specify formal agreements and mappings among the policies of two or more CAs that are not part of the same hierarchy.^[18–20]

Although digital certificates are in increasing use today, there is less experience with the potentially complex interactions of the policies of the supporting CAs. An alternative to using a certificate with an intricate set of policies behind it is to use a number of different certificates, each with a relatively simple policy, for different purposes.

In the PGP architecture, certificate authorities are not used to invest trust in the correspondence between an identity and a public key. Instead, PGP certificates contain any number of digital signatures, with each signature investing a degree of trust in the identity-key correspondence asserted by the certificate. The validity of a PGP certificate is determined by the sum of trust in the signers. The validity of each signer is determined by the same process, establishing a network or "web of trust" among certificates.

Public key systems must also have special procedures when someone's private key becomes compromised or is revoked for cause (e.g., termination of employment). Current designs recommend that the authenticating system consult a list of revoked certificates, which is normally maintained by the CA. In PGP, individual signers may revoke their own signature, and maintaining a centralized list of revoked certificates is similarly suggested.

It is also recommended that these systems should establish procedures for recovering a private key if it is lost. Traditional backup methods may not provide adequate security protection. In cases where a key is associated with a role, such as Chief Financial Officer, rather than an individual, a lost private key may have far-reaching impact. In business, conventional escrow procedures may suffice. More generally, schemes have been developed to divide a key into segments, or "shares," that are distributed to trusted parties so that more than one party must cooperate to reconstruct the key.

Processes to support longer-term digital signatures are not well developed. After a private key is revoked or

expires, documents signed with that key should remain valid if they were signed while the key was still valid; this suggests an archive of private keys. The policies and procedures for creating, maintaining, and accessing such an archive have yet to be adequately specified or implemented.

Traditional signatures are used, for example, to assert authorship of a document, agreement with a document, and witnessing of an event, but there is no current method to express these semantics with digital signatures.^[21] Traditional methods for verifying the authenticity of a document, such as corroboration by an expert, forensic analysis, consistency of dating, provenance, and common sense, are not addressed by the purely computational nature of digital signatures. Additional research is necessary to better understand these issues and to suggest procedures and infrastructures to support them. None of the authentication methods discussed, and the processes to support them, adequately address historical expectations of privacy.

One method for improving privacy protection is to introduce an intermediary authenticating service, which performs authentication with an individual and then acts as a proxy for further transactions on behalf of that individual.^[22] There is little consensus on the behavior, responsibilities, policies, and trust relationships of such intermediaries, and the intermediary itself may willingly or, if compromised, unwillingly disclose private information, tying individuals to their proxied activities.

Privacy concerns are an active area of social and legal discourse as well as of technical research. Traditional libraries have historically acted as intermediaries for access to information, and have carefully implemented policies and procedures to guarantee individual privacy. The library community has taken an active role in translating those methods to digital information.^[23,24]

AUTHORIZATION

Authorization, sometimes called Access Control or Access Management, is the process by which an individual or other entity is permitted to perform some operation on a computer system. Authorization may apply to an organization as well as to individuals, or to automated processes acting on their behalf. In the technical literature, the individual, organization, or process is referred to as the “subject.” Authorization happens in the context of (i.e., subsequent to) authentication. The authorization decision is, in other words, given someone’s identity, what may they do? What information may they see; what may they create or destroy; what may they change?

The earliest authorization process was implicit: if one had physical access to the computer, one could do anything with it. (To some extent, this holds true today for personal computers.) When computing and information resources, or “objects,” as they are called, are shared among many

subjects, more elaborate methods are necessary to ensure that appropriate access is granted to each.

Current authorization systems divide access rules into three broad categories: whether a subject may retrieve an object (“read”); whether a subject may create, change, or destroy an object (“write”); and the extent to which a subject may alter the authorization rules themselves. These categories are called “operations.” Thus, authorization is the process of determining which operations are permitted between a given subject and object.

Operations are performed by computer software applications. In early systems, the authorization decisions were made directly in the application, and the behavior of the program logic depended explicitly on the subject’s authenticated identity. This method has been superseded by independent authorization systems and infrastructures that interact with applications in a range of ways. For example, in some cases, an application explicitly consults the authorization service to determine if an operation is permitted. Or the authorization service may be part of the underlying operating system, automatically enforcing permissions on operations requested by applications. Analysis of application and operating system logic and their interactions can offer a relative measure of security or trust in the authorization service.^[25]

Authorization may be considered an implementation of policy,^[26] and an important goal of authorization systems is flexibility, accuracy, and efficiency in implementing policies. Actual policies can be highly complex, involving classifications, hierarchies, interrelationships, exceptions, degrees, and emergencies. They may be motivated by legal, business, or political needs. They may change frequently. Not surprisingly, the development of effective authorization systems is an active area of research. Three principle system models are currently most common: mandatory, discretionary, and role based.

Mandatory Access Control

In mandatory access control (MAC) or “lattice-based” access control systems, a security administrator assigns classification labels to all subjects and all objects. These labels are ordered to reflect the levels of security required, for example, “unclassified,” “confidential,” “secret,” and “top secret.” Objects may be further categorized within a security level. Subjects are assigned labels corresponding to their maximum security clearance, and to the categories within that clearance that they may access.

A principal concern of MAC systems is the control of the information flow between levels. A typical implementation, for example, may permit subjects to read objects only at their own or lower levels and to write objects only at a higher level. The strict controls on information classification and flow, coupled with the central authority of the security administrator, make MAC systems attractive in military applications. The policy known in the financial

community as the “Chinese Wall,”^[27] which is designed to prevent financial analysts from reading objects that could create a conflict of interest with respect to other objects they have already seen, may be enforced with a variant of a traditional MAC implementation.

Discretionary Access Control

Discretionary access control (DAC) relies less on a central security administrator, putting more of the burden on an object’s owner. The owner is usually the subject that created the object. In DAC, the owner may change the access permissions of an object, granting, for example, read or write access to other subjects. In some implementations, the owner may delegate this granting ability itself to other subjects or may transfer ownership of an object to another subject.

Although DAC is much more flexible than MAC, the security is weaker. For example, in DAC, it is possible to make a copy of an object that has fewer restrictions than the original. Because security policy is not governed by a single authority but is distributed across all owners, it is difficult to assess the overall security of a DAC implementation. Nonetheless, DAC is widely popular in many operating systems and databases.

Role-Based Access Control

Role-based access control (RBAC) has gained significant attention for its power and flexibility.^[28] Within RBAC, subjects are assigned one or more roles, with each role embodying one or more permissions. Permissions may be read, write, and the ability to adjust the authorization system itself.

Roles typically are identified with a business or organizational capacity, such as “Chief Financial Officer” or “enrolled student,” and thus simplify making changes in permissions when a subject’s role changes (because you just change the person’s role instead of revamping all the permissions that person has). Roles may be organized in hierarchies, so that certain roles imply others through inheritance. Constraints may be placed on the system to implement desired policies (e.g., multiple signature requirements, performance of tasks in a particular order, enforcement of the separation of responsibilities).

RBAC systems are also considered flexible enough to implement both MAC and DAC policies.^[29]

There is much ongoing research on RBAC devoted to such goals as improving its performance in highly dynamic settings^[30] and improving its ability to express complex policies.

Other Kinds of Access Control

The methods above play a predominant role in existing implementations and in research. But the goal of enforcing

policy is broad and may be approached in many ways. For example, the “trust management” approach combines the trust relationships of digital signature authentication with the expressions of policy.^[31] Generally, the digital rights management community has been highly active in developing mechanisms to express trusted policy assertions on the Internet.^[32–35]

Automated Acquisitions

Patricia A. Smith

Allison V. Level

Colorado State University, Fort Collins, Colorado, U.S.A.

Abstract

“Automated Acquisitions” describes the automation of acquisitions work, which began with the development of simple ordering and receiving systems. Over the years, these systems have expanded to automate acquisitions work generally and to integrate acquisitions with other major library functions such as cataloging, circulation, and collection development. Automation has also promoted electronic interfaces with monograph and serial vendors and with institutional accounting systems. Increasing growth of electronic collections requires additional system development to accommodate the various components of this complex workflow. Workflows in acquisitions are enhanced by online cataloging services, such as OCLC’s Promptcat or vendor-provided MARC records, which allow libraries to receive books cataloged and shelf-ready; and electronic books have led to many interesting new models of acquisitions, including demand-driven acquisitions. To promote operability among various systems, standards adopted by publishers, vendors, and libraries are increasingly important and a focus of development in the field.

INTRODUCTION

Libraries have automated acquisitions for a variety of reasons, including lowering unit costs, improving access and service to users, speeding the ordering–cataloging process, accessing ordering, and in-process information, collecting and organizing acquisition data, gathering data for assessing collections, and linking with other systems both inside and outside the library to assure efficient workflows. The complexity of electronic resource management (ERM) has added new challenges for workflows, data collection, and system linking.

When selecting a system, librarians should consider 1) the capacity of the system, that is, whether it will handle the required number of orders, funds, and the like; 2) the cost of installation and maintenance; 3) compatibility with other systems; and 4) functionality, that is, whether it offers the functions required and whether staff can easily perform them. If a system appears to meet these criteria, then the library should verify performance by requesting written documentation from the vendor and securing references from institutions using the system. Most libraries also prepare a formal request for proposal (RFP) from several vendors, a proposal that lists all the library’s requirements.

As a minimum, automated acquisition systems should perform some or all of the same activities required in a manual acquisitions operation but with the added requirement that the system perform them more efficiently and effectively. Automated systems can achieve these ends by making data transfer more accurate, by reducing costs through economy of scale, and by collecting new data or manipulating it in new ways.

THE EVOLUTION OF SYSTEMS

Automation of acquisitions functions began in the 1930s and 1940s, before the computer age, with the use of punch-card systems for in-process control and ordering. Because of the complexity of acquisitions processes and the difficulty of integrating them with local accounting policies and procedures, these early efforts relied on single-function systems.

Great impetus to automated acquisitions came in the 1960s when research libraries and many medium-sized libraries, especially in the United States, were growing rapidly. Federal grants, the PL480 program, and the expansion of higher education all contributed to a phenomenal increase in acquisition budgets for both academic and public libraries, but with no or limited increase in staffing. Coinciding with the dawning of the computer age, the pressure generated by these large budgets and significant gifts led individual libraries in the 1960s and 1970s to rely increasingly on computerized single-function or multiple single-function systems. Developed in-house, these simple, typically machine-dependent systems operated in a batch mode; that is, the data were collected and processed periodically, and order forms, reports, or other printed products or electronic files were the result. Generally, libraries automated only parts of the acquisitions process, usually order/receiving, in-process files, or accounting functions. These systems typically operated on a general purpose mainframe computer housed and managed outside the library.

Other libraries using the same hardware sometimes borrowed or purchased these systems but doing so typically required significant local programming to run

effectively. Because these programs were machine dependent, library literature from this period contains close descriptions of the computer hardware required. Few libraries, of course, had the resources to develop such systems, nor were early commercial vendors able to create successful generic programs for acquisitions because practices from library to library vary so much more than, for example, those in circulation.

In 1969, Baker and Taylor released BATAB, the first jobber-supplied, commercial acquisitions system. BATAB was a batch software package that ran on a local mainframe and featured a range of acquisitions functions, including selection lists and purchase orders; claims and cancellation lists; detailed fund accounting; and historical, open-order, and in-process reports. BATAB focused on relations between libraries and book jobbers, Baker and Taylor in particular, where orders could be placed by output via magnetic tapes. Other book vendors followed suit, and in less than a decade, Brodart offered the first jobber-supplied online order service, Instant Response Order System (IROS). Released in 1978, IROS gave customers online files and online ordering. Marketed primarily to public libraries, IROS did not offer fiscal or processing management, but online access to jobbers' publication databases, nonetheless, remains today a constant of book and serial vendors.^[1]

The advent of online capability in the later 1970s meant that in 1982 Washington Library Network (WLN), a bibliographic utility, brought out an acquisitions system as part of its networked services to libraries. Other major utilities—Online Computer Library Center (OCLC), Research Libraries Information Network (RLIN), and University of Toronto Library Automation Systems (UTLAS)—soon followed.^[2] These networked systems brought an important advance over then-current systems for acquisitions by offering integration with other library processes including circulation and cataloging and provided full-function acquisitions services. As a result, the bibliographic utilities gave birth to the first integrated library systems (ILSs).

ILSs proliferated in the 1980s as commercial designers joined the marketplace to create multifunction, multiuser systems combining cataloging, circulation, serials, and acquisitions modules. Acquisitions data could now be shared among all modules and displayed for users in the online catalog. These commercial systems continued to evolve throughout the 1990s although fewer than half of the academic libraries implementing new systems opted to include acquisitions or serials components during this period.^[3] A decade later, however, most academic and larger public libraries had fully functioning ILSs and could choose among several types: 1) turnkey systems where the library is responsible for little more than turning the key to the system, that is, the commercial vendor installs the software and hardware for the library, connects the library to the network, and provides most technical

support; 2) standalone systems where the library essentially stands alone, that is, the library purchases or is free to purchase the hardware and software separately, installs both, and independently administers the system except for such limited technical support as hardware and software commercial vendors normally provide; 3) hosted systems where the library buys the commercial vendor's software but the vendor hosts the software on its server, which library staff access through the Internet; and 4) service-as-a-subscription (SaaS) systems where, rather than buying the software, the library pays a subscription for online access to its own version of the commercial vendor's ILS software.^[4]

ILSs provided by commercial vendors were typically proprietary systems that guaranteed performance but restricted access to the source code, thus preventing customization for local needs. Responding to rising library dissatisfaction with this lack of flexibility, ILS commercial vendors have made their systems more "open," especially by offering application programming interfaces (APIs). APIs allow libraries to do such local programming as establishing interfaces with a parent institution's financial system.^[5] Since vendors charge for additional features, costs have risen as well, leading to more library frustration with traditional ILS commercial vendors.

As an alternative to proprietary systems, libraries continue to explore open source software in hopes of finding more affordable and customizable systems. Open source systems strive for the same functionality as commercial ILSs, but members of an open source community share in the development of the source code, which is free for anyone to download and update.^[6] The success of these efforts varies, and users have found important functionality lacking in some.^[7] Two systems working primarily with public libraries and consortia are Koha (www.koha.org), which first appeared in 1999, and Evergreen (<http://evergreen-ils.org>). Open Library Environment (OLE) by the Kuali Foundation (www.kuali.org/ole) is an important initiative by academic libraries.

Into this mix of systems has come yet another potentially revolutionary force. As electronic collections began to appear in the early 2000s, librarians realized that the automated acquisitions and serials modules of the traditional integrated library system were not capable of tracking all the necessary information or of accommodating workflows that ERM requires.^[8] Many libraries developed home-grown databases, spreadsheets, or standalone systems to fill the gaps. Recognizing the disorganization of this approach, the Digital Library Foundation (DLF) and the National Information Standards Organization (NISO) established a steering group to guide the development of standards, specific data elements, and functionality for ERM to foster interoperability (ERMI) among various applications.^[9]

Encouraged by library interest and guided by this ground-breaking DLF ERMI report, automation vendors

began to produce standalone ERM systems or to incorporate ERM as modules of their ILS. Open source ERM systems have also appeared. CUFTS, an extension of a suite of open source discovery tools developed at Simon Fraser University,^[12] and the University of Notre Dame Libraries' Centralized Online Resources Acquisitions and Licensing (CORAL) are standalone open source ERM systems. Librarians have also tried to address the obvious need for ERM and ILS interoperability, especially with the acquisitions module, and in 2008 another DLF subcommittee studied this issue and identified key acquisitions elements requiring interoperability. This report also saw the need for an identifier unique to each resource for accurate interfacing.^[10]

Ongoing, critical analysis by librarians of changing workflows will continue to be an indispensable part of achieving an effective system for ERM.^[11] Essential elements that have been identified include tracking acquisitions and budget information, license terms and conditions, and administrative and contact information for individual electronic resources. Giving users ready access to electronic materials is also important. Providing full texts, for example, requires such tools as OPEN URL link resolvers and knowledge bases. Reports and data analysis going beyond current ILS capabilities, too, must be developed for collection assessment and selection. Per-use cost for individual electronic journals, particularly those in serial publisher's "big deal," for example, is another primary need. Although standards such as Counting Online Usage of Networked Electronic Resources (COUNTER) and products like the Standardized Usage Statistics Harvesting Initiative (SUSHI) are available to facilitate compiling and reviewing statistics on the use of a library's electronic resources, such tools are still incomplete in their coverage and application and vendor data are inconsistent.^[12] Additional statistics and data often have to be gathered from individual vendor webpages and tracked and manipulated in local spreadsheets. In short, tools and methods for assessment and evaluation of electronic usage still require research and development.^[13]

Responding to current needs, major automation developers introduced new systems in 2012 variously referred to as library management systems, web-scale management solutions, or library service platforms (LSPs). These new systems seek to consolidate in a single interface the essential functions of a traditional ILS for print materials with the multiple tools needed for ERM. These platforms or services combine acquisitions, ERM, serials, reporting capability, link resolvers, discovery programs, and other relevant library software under a comprehensive knowledge base or information center.^[14] The Global Online Knowledge bases (GOKb) project being funded by a Mellon Foundation grant and led by the University of North Carolina Libraries (<http://gokb.org/>) is a current effort to provide a comprehensive knowledge base and will be

adopted for Kuali/OLE's open source library platform—freely available to anyone whether a librarian, a commercial system vendor, or a publisher. Since major institutions in Europe and the United States are contributors, GOKb promises to be a significant source of information and metadata needed to manage electronic resources.^[15] Unlike the traditional ILS that comes with a prescribed user interface, these new systems permit libraries to implement the discovery tools they choose, even a product from another commercial vendor. These systems also seek to improve ERM by simplifying other processes such as input on trial databases, adding holdings for titles, and coping with licenses. To address the need for improved data to aid decision making regarding electronic resources, LSPs also propose to support more sophisticated reporting, using analytics and data mining across various components of collections.^[16]

Another potential advantage of these new systems is that, based on cloud-computing with its reduction in both upfront costs for equipment and for local maintenance staff, libraries may be able to achieve important savings. Depending on the annual subscription fees, these services may also be options for small libraries that have little or no automation.^[17] Major commercial vendors offering LSP services include Alma by Ex Libris, Sierra by Innovative Interfaces, Intota by Serials Solutions, and WorldShare by OCLC, and OLE by Kuali Open Library Environment.^[18] In 2014, the University of Chicago launched OLE; a number of other universities are scheduled to become early adopters of OLE in 2015.

As libraries consider the emerging options for improving or replacing their current systems, much—as always in automated library acquisitions—remains to be learned about impacts on costs, staff, and workflow.

BASIC COMPONENTS OF AN AUTOMATED ACQUISITIONS SYSTEM

A 1999 model RFP in *Library Technology Reports*^[19] and the ongoing experience of acquisitions librarians make it possible to list the basic features desirable in an automated system. The elements in this RFP are standard features in the acquisitions modules that commercial vendors provide in an ILS and are primarily based on the acquisitions of print materials. Acquiring electronic publications also involves similar ordering information and budget control, but additional tools will be required to manage other aspects of electronic collections.

Verification of bibliographic data for new orders: An automated system for acquisitions should include a link to a source of bibliographic data in MARC format that can be downloaded into the new order file. The source of these data can be a bibliographic utility such as OCLC, Library of Congress MARC

records, or a database of MARC or MARC-like bibliographic records from a materials vendor. Vendor records usually have the added advantage of including price and invoice data that can be loaded into the system, thus reducing posting time by staff.

Centralization and integration of on-order and in-process information: Even the most basic systems maintain an automated file of titles on order or in process. When acquisition is part of an integrated library system or has links to other systems in the library, this file, at the discretion of the librarian, can be accessed through the online catalog. In this case, the file should be interactive so that changes made in the acquisitions record are also reflected in other library files. Patrons and selectors should be able to access the data in standard ways: author, title, series, ISBN, LCCN, keyword. Acquisitions staff and searchers should be able to access information with appropriate local keys, such as purchase order number, and be able to find titles cataloged or on order so that duplicate orders can be rejected and relationships to other titles in the collection can be identified. If the librarian is ordering an added copy or added volume, the system should permit borrowing of a bibliographic record from the online catalog or from an acquisitions file.

Generation of printed and/or electronic purchase orders and quotations requests: The system should handle different formats—print, nonprint, and hybrid monographs and serials that have associated electronic components. It should accommodate a full range of order types, including serials, standing orders, rush orders, prepaid orders, deposit account titles, and gifts. Once a purchase order has been entered, the system must not only store all bibliographic and purchasing information but also index and link critical elements so that the record can be retrieved by all appropriate search keys. The system should produce orders in print or send them electronically to vendors that have such capability.

Online vendor files: Each vendor record should store and index a variety of information about itself, including ordering and pay-to addresses, claiming intervals, names of contacts and phone numbers, and notes such as discounts. If the order system links vendors to an institutional accounting system, the record should contain a field for vendor numbers matching the number in the institution's file. Vendor records should also provide the link needed to generate an electronic order to that vendor.

Automated review of order records for claims or cancellations: The system should offer file management options such as alerts for claiming or canceling, but ideally the library should have the option of setting the system to claim or cancel automatically if the vendor permits automatic cancellations. The system

should produce electronic and printed claim/cancellation requests or offer a list for librarians to review and track the date and type of requests generated.

Recording of receipt information: The system should be able to handle titles that are received in full and titles where only part of the order is received. When partial receipts are recorded, the system should disencumber only the cost of the part or the volume received and keep remaining parts of the order open.

Payment of invoices: When invoices are received, staff should be able to enter invoice data automatically into each individual purchase-order record associated with that invoice. If the system does fund accounting, the system should create an electronic invoice record that can be approved online. Approval of the invoice should produce, electronically when possible, a voucher or a check.

Fund accounting: Basic fund accounting should include a fund record file with the capability of handling all the funds needed by the library. The system should record encumbrances, disencumbrances, and expenditures against each fund as transactions occur. Users should be able to view online the fund allocation, the amount encumbered, the amount expended, and the uncommitted and cash balances. The system should likewise validate fund codes entered during ordering and disallow incorrect codes. Each fiscal year, the system must provide the end-of-fiscal-year processing needed to move to a new fiscal year. Since requirements vary by library, the system should be flexible enough to establish new fund records for the new fiscal year or to leave a purchase order linked to a previous fiscal year so that it is paid with funds from the appropriate fiscal year.

Management reports: Automated systems should include a report generator adaptable to local needs in the type and timing of reports and offer options for online or printed output. The data should be compatible with standard database or spreadsheet software. Basic reports include fund reports, vendor-performance statistics, and staff performance statistics. Other reports should be available for collection development, for example, a list of titles acquired by fund or selector linked with data in other library modules, such as circulation or cataloging.

Security: Automated systems should provide for a variety of password levels, with two being an absolute minimum. Many functions such as fund control require secondary password levels so that unauthorized staff cannot create or change records. Ideally, passwords should be controlled at the local level by authorized staff and be constructed so that one log-on unique to an individual staff member serves to authorize all the functions that the person is permitted to perform. Histories of transactions

with associated passwords should also be maintained by the system so that supervisors can review actions to see who has performed them. The system should, finally, perform validity checks for funds and other elements deemed critical by local auditors.

Archiving: Since most libraries periodically archive completed acquisitions and fund data, the system should provide common archiving options: tape, microform, or disk. Another desirable option for easy retrievability would be to have the archive reside on a separate file as part of the integrated library system. Should a library migrate to another system, the system should be able to provide a copy of the library's acquisition files in an electronic format.

Other features that augment this list should include OPAC searching options, links to other databases or modules in an ILS, Z39.50 clients and servers, and web-based clients. Librarians now expect systems to include ERM components, which allow them to track individual holdings, licenses, and usage statistics associated with electronic products. The acquisitions system should have the qualities of good library systems, such as system integrity, file output for data sharing or migration, logical screen and function layouts, and user support.

Finally, fully automated systems should support interoperability with other local and external systems related to acquisitions of library collections and adhere to industry standards that enable effective exchange of data.

INTERFACES WITH EXTERNAL ACCOUNTING SYSTEMS

An important interface that many libraries require as part of its process for paying vendors is a linkage with the parent institution's automated financial system where the check is generated. Automating this accounting interface between the two accounting systems can be beneficial to both the library and the larger institution.^[20] Such an interface should permit vendor and voucher information to be sent to the parent system and must provide for consistency and security of data between the two systems. Since financial systems, security requirements, and audit controls vary widely from institution to institution, most links to parent accounting systems have been locally developed in cooperation with an institution's auditors. The emergence of APIs as an ILS function has assisted these local efforts to customize financial interfaces.

Before implementing an automated payment system, librarians must acquaint themselves both with the institution's audit requirements and with the automated system's internal controls. Traditional auditors still require some parts of the old paper trail for invoices, but use of

electronic file transfer protocol (FTP) and reliance on electronic passwords for authorizing transactions will eventually make most paper records obsolete. Generally, too, auditors require that the functions of ordering, receiving, and payment be separated and that records of who performed these transactions be maintained for verification with lists of authorized signatures. As automation advances, even signatures will be replaced with authorized lists of electronic passwords. Electronic fund transfer (EFT) from the account payable unit of an institution to the bank of the vendor is becoming increasingly common.

INTERFACES WITH THE BOOK AND SERIAL INDUSTRY

By the 1990s, book and serial vendors had automated the majority of their internal operations and could offer libraries a broad range of automated services, including everything from order processing, claiming, and invoicing to approval-plan profiling and management.^[21] The sophistication of these processes will vary among vendors depending on the library market they serve. Smaller vendors may not offer the range of services a larger academic vendor can; therefore, libraries need to explore with their vendors what they can provide. In many cases, vendors are willing to work with a customer to develop a service.

Various online ordering models are available. Serial vendors, for example, offer password access to their databases to allow customers to verify, order, and claim serials within the serial vendor's database. Book vendors have also automated their publication databases and offer online access to libraries. The result is that before placing a firm order, libraries can now call up specific titles to see if the title will come as part of the library's approval plan or as a standing order and, in some cases, check the jobber's inventory to see if a copy of the book is in stock. While online with the jobber, library staff can also place orders or request that a title be sent as part of the approval plan. The jobber's system then creates a file that acquisitions staff can use to download electronically into the library's acquisitions system, creating an order record in the process. This download requires specially programmed loaders to map and link the data from the book jobber's system to the formats required by the library's acquisitions system. After library staff members determine that the title is not a duplicate and that funding is available, they can confirm the order with the vendor by returning the order electronically to the book jobber. MARC cataloging records can also be provided by the jobber in this model or the vendor can send the title to OCLC's Promptcat service for cataloging before it is sent to the library. The Promptcat service has been merged with OCLC's WorldCat Cataloging Partners program, which also includes the former Cataloging Partners program. OCLC provides a list of the print and e-book

vendors that participate. As another alternative for expediting firm orders, staff can set up in their local acquisitions module an address for participating vendors and send electronic orders directly from the ILS without going online to the vendor. Other services include electronic invoicing via FTP.

Approval plan vendors, such as Coutts Information Service or YBP Library Services, routinely supply books shelf-ready. For each shipment, they will provide the library an electronic file of bibliographic records with attached invoices that can be loaded into the library's acquisitions system to create an order record facilitating payment. Working with the WorldCat Cataloging Partners model, libraries can use these records to also serve as the basis for the library's cataloging record. The vendor sends a manifest of the libraries' approval titles to OCLC's cataloging service. While the books are being shipped to the library, OCLC uses automated search algorithms to check OCLC's bibliographic files for a matching cataloging record and puts that record in a file for the library to load into its local online system. An advantage of using OCLC's service for cataloging records for those libraries that maintain their holdings symbol in OCLC is that the WorldCat Cataloging Partners' program automatically sets the library's holdings symbol in OCLC according to a time frame predetermined by the participating library, eliminating the need for staff to upload records to OCLC once the book is available for check out.

The advent of electronic books has brought new interfaces incorporating vendor-provided discovery records which may not meet the standards of a full MARC record. As a result, patrons can find available titles in the library's online catalog and request a short-term loan (STL) at some fraction of the list price. After a specified number of such requests, the library purchases the title. When the library purchases these titles, however, the discovery records can be upgraded to a full catalog record by the vendor or the library or sent to OCLC's cataloging services, using the capabilities of automated systems at the e-book vendor. If the item comes via an approval plan, the record exchange involves yet one more system in this complex array of interfaces.

STANDARDS

Standards are the key factor for successful interfaces between vendors and library acquisitions/ERM systems. This exchange of electronic data in a standardized form from one computer to another is called electronic data interchange (EDI). For EDI to work, two standards are necessary, one for the contents of the message and a second for the packaging of the transmitted information.

The creation of standards has fallen to voluntary professional and industry associations. One of these, the Accredited Standards Committee (ASC) (<http://web.ansi.org/>), part of the American National Standard Institute

(ANSI), has taken responsibility for establishing standardized formats for ordering, shipping, receiving, payment, and claims. The specific standard for electronic data interchange is X12, and the ANSI X12 formats were created for transmitting and receiving information. Another group, the (NISO, <http://www.niso.org/>), which is accredited by ANSI, has taken responsibility for standards relating to metadata and retrieving, storing, repurposing, and archiving information.

The Book Industry Standards and Communications Committee (BISAC, <http://www.bisg.org/index.html>) has established fixed formats for transmitting orders and claims for monographs. A parallel organization, the Serial Industry Systems Advisory Committee (SISAC), has promoted voluntary standards for electronic transmission of serials information. In 1998, these committees merged into a group named Book and Serial Industry Communications (BASIC, <http://www.bisg.org/basic.html>) to continue to foster standards for EDI formats for books and serials based on the international EDI standards. This group, which is officially a working group of the Book Industry Study Group (BISG), coordinates its efforts in creating standards with EDItEUR, a nonprofit agency with members from various countries around the world, including the United States (<http://www.editeur.org>). EDItEUR supports the EDIFACT guidelines for transactions used in the book trade and also manages important identifiers such as the international ISBN and ISSN as well as maintaining the ONLINE INFORMATION EXCHANGE (ONIX) standard for publishers to use for data fields (e.g., ISBN, title, author, reviews, etc.) when sending information describing books to libraries or book stores. ONIX is also extending to journal subscriptions and licenses.

In 2007, the 10-digit ISBN was replaced by the 13-digit ISBN and required everyone in the book supply chain from publishers, jobbers, and libraries to make certain their systems would support the full 13-digit ISBN. As a result, many systems have dropped BISG/BISAC and require the EDIFACT formats for transmitting orders electronically.

The transition to electronic collections has led to major efforts to develop standards or guidelines for exchanging data for usage statistics, license information, and other facets of electronic publications. NISO is sponsoring an initiative called Standardized Usage Statistics Harvesting Initiative (SUSHI, <http://www.niso.org/committees/SUSHI/>) using a standard data container for transferring COUNTER statistics into a digital repository. Integrated library systems are now employing SUSHI to gather usage statistics for a library. Project COUNTER is an effort to produce guidelines for counting electronic use statistics and is widely supported by publishers and libraries. The Digital Library Federation (DLF, <http://www.diglib.org/>) supported the Electronic Resource Management Initiative (ERMI), which has developed guidelines for defining elements of electronic resources and their associated licenses.

An extension of this effort is the joint NISO/EDItEUR ONIX-PL Working Group developing a standard for exchanging license information between publishers and libraries. The Knowledge Base and Recommended Practice (KBART) project (www.niso.org/workrooms/kbart) is an ambitious effort to provide guidance to content providers and knowledge base creators for metadata formatting so that knowledge bases and link resolvers get users to the desired content. Many additional standards exist and many more will continue to emerge.

THE INTERNET AND E-COMMERCE

Acquisitions librarians have found a variety of uses for the Internet that add convenience to daily routines and increase access to resources. The listserv and social media have become popular forums for discussion of acquisitions and serials issues and an excellent way to stay abreast of major trends. ACQNET-L and SERIALIST-L are two of the common forums for monograph and serial acquisitions. LIBLICENSE-L is important for obtaining information regarding the licensing of digital publications and other legal issues. ERIL-L promotes discussion of issues related to managing electronic resources. Techniques in Electronic Resource Management (TERMS) is an ongoing project to develop best practices for ERM and uses Facebook, Twitter, and a blog (<http://www/6terms.tumblr.com>) to share ideas.

Websites offer a wealth of sources for collection development and acquisitions. Borrowing ideas or procedures from the web pages of other acquisitions departments has become common practice. Staff can also access other library catalogs to find citations to aid in bibliographic verification. Many libraries also order titles from Amazon.com or Barnes & Noble's online store as a quick source for rush items.

And nowhere has using the Internet been more gratifying to librarians than in helping them find out-of-print materials. The formerly idiosyncratic and disorganized world of used and antiquarian book dealers has seen new markets develop as buyers and hundreds of dealers embrace the Internet as a distribution center.

The use of credit cards for e-commerce is now common. Among the advantages are ease in dealing with e-commerce dealers and reduction of check-writing for petty sums. On the down side, credit card transactions require extra steps in tracking and do not interface directly with library systems.

IMPACTS ON WORKFLOW AND ORGANIZATION

Automation of acquisitions data and integration of that data with other library systems has led to major

reexamination of workflows and organization within technical services. Traditionally, acquisitions departments did preorder searching and ordered materials, while cataloging departments performed the bibliographic and authority searching necessary for cataloging a book. When the online bibliographic utilities such as WLN, RLIN, and OCLC became available, acquisitions and cataloging librarians realized that the order verification information could also be used by the catalogers if staff agreed on policy and procedures. The recognition that the knowledge, skill, and tools employed by acquisitions and cataloging staff are similar led many technical services librarians to consolidate preorder and precataloging searching into a single unit that might report to either acquisitions or cataloging departments. As the integration between acquisitions and cataloging modules on automated systems evolved, acquisitions and cataloging librarians gave greater attention to generating accurate bibliographic records at the earliest possible stage of processing. In particular, staff could eliminate several searching and keying steps, thereby reducing the costs of searching bibliographic databases and shortening the time between receipt and cataloging for a book. As a result, some libraries adopted cataloging at the point of receipt for selected materials so that the staff member who searched and found acceptable bibliographic copy for a book when it was received could also catalog that book. This combination of tasks has led to the creation of fast cataloging units in many libraries. Increasingly, acquisitions department staff members now perform cataloging using Library of Congress MARC records retrieved from bibliographic utilities or from jobber-supplied MARC records received with the book. Discovery records provided by e-book vendors to help libraries and patrons find titles for short-term loans in demand-driven acquisitions (DDA) products can also be upgraded to full cataloging records by acquisitions staff.

Automated acquisitions has also brought important benefits for collection development librarians, and the traditional lines separating acquisitions from selecting have begun to show signs of blurring as well. Budget reports now can be drawn with greater frequency and timeliness, while the increased ability of automated systems to correlate acquisitions data with circulation and cataloging data has improved the management reports that can be compiled for collection analysis. Selectors, moreover, can now access the centralized file of orders to review the status of their orders without relying on the acquisitions department.

Because selection has also become more automated, many libraries have moved away from collection bibliographers toward subject/reference librarians who use the time gained for instruction and reference as well as selection of print and electronic materials. Certainly, the automation of a large portion of the publishing universe allows the possibility of more sophisticated purchase plans

replacing the costly title-by-title examination selectors once practiced with traditional approval plans. The possibility of receiving approval books shelf-ready and the increased use of OCLC's WorldCat Cataloging Partners service for cataloging has led to further implementation of plans where the books are not returned to vendors. As these purchase plans replace approval plans, collection developers and acquisitions librarians will increasingly focus on becoming expert designers and managers of profiles and systems.

Another area of staffing change has come with the creation of ERM librarian positions within acquisitions or serials units. The more traditional serials librarian roles have also changed to include greater focus on electronic acquisitions and require a greater need for expertise with licensing, authenticated access/proxy servers, open uniform resource locator (URL) linking, and creation of A to Z database and journals lists. ERM librarians often help gather and organize usage statistics and provide licensing and cost data to collection development librarians who then incorporate the metrics into the selection and evaluation process for the library.^[22]

The ease of sharing data from automated acquisition systems means also that collection developers operating within consortia can now remove significant obstacles to resource sharing and cooperative acquisitions. Sharing acquisition data allows members to tag titles automatically for cancellation or purchase and so to expedite cooperative ventures.

ELECTRONIC PUBLICATIONS AND PATRON-DRIVEN ACQUISITIONS

Electronic book products have raised new questions of distribution, pricing, ownership, and contracting for the acquisitions librarian. E-books are promoted to academic libraries in several ways including 1) publishers offering direct marketing of content to the library, 2) specialist aggregators packaging and presenting books in particular subject areas, 3) large aggregators offering e-books in many disciplines from multiple publishers, and 4) library vendors offering e-books and print books from both the aggregators and from individual publishers.^[23]

1. Direct purchases of individual e-books from publishers usually allow libraries more permissive digital rights management (DRM) and give patrons greater freedom to download or share. Some publishers, however, opt to sell only an entire "package" of titles and do not make individual titles available for purchase. Other publishers offer an evidence-based model (EBM) allowing access to a specific list of titles for a set period of time. In this model, a library agrees to pay a specified dollar amount at the beginning of the time period, and then at the end of the period, the library selects the titles to

purchase, up to the defined dollar amount. The pool of titles available to the patrons during the open period is quite extensive and represents a dollar amount several times greater than the amount paid upfront by the library. At the end of the EBM specified period, the library reviews the "evidence" provided by usage statistics to guide final title selections.

2. Specialist aggregators often bundle titles around related subject areas or types of books such as reference materials. Bundling can be a benefit for users since the e-books are collected together by subject or type, and the specialist aggregators often have a search feature that allows searching across all content in the specialist package. But like database/journal aggregators, titles can change and move into and out of the specialist packages.
3. Large aggregators offering e-books from multiple publishers permit librarians the significant advantage of automating and streamlining the process for discovery records, book purchase, and use of e-books by users. The advantage for users is that they see their books through the same platform.
4. Library vendors selling e-books and print books from aggregators and individual publishers offer a variety of different purchasing models. The standard model permits libraries to purchase books title by title and own the book outright. Another model is common for approval plan vendors. Here libraries add electronic books via their approval plan profiles, which then link the approval plan with e-book aggregators or e-book publishers. Finally, some vendors offer patron-driven acquisitions (PDA) or DDA by which libraries acquire books only as patrons ask for them, often with an option for an STL first, before repeated uses trigger purchase of a book. In 2014, NISO announced a recommended practice on DDA that covers these various options and will serve to guide libraries, publishers, aggregators, and vendors on management of DDA services.^[24]

The PDA or DDA model is also moving into use by library consortia. The Orbis Cascade Alliance and the Colorado Alliance of Research Libraries are two groups operating a DDA selection model cooperatively among several libraries. Formerly, the choices for "ownership" were limited to purchase or lease; now there are options for the number of simultaneous users of a particular title, limits on the status of users, and sometimes frequent changes in what access a particular publisher will allow. As Rick Anderson describes, "There are many PDA models currently under development, and we can expect that they will proliferate and be refined over time. While some libraries will (and should) still be building monumental collections in 2021, I am confident that the standard approach for most research libraries will be patron-driven."^[25] Whether to acquire e-books as collections or singly or as subscriptions

or with perpetual access are just some of the issues acquisitions librarians now face.

For electronic journal articles, acquisitions librarians have yet another patron-driven model now poised for further development. In the past, requests for articles not available from an academic library's current subscriptions went to an interlibrary loan (ILL) department and could be sent electronically by direct document delivery to patrons. A vendor- or publisher-supplied model for journal articles has emerged by which some academic libraries now fill requests on an article-by-article or pay-by-the-drink basis. A library, working through a publisher or vendor, provides money on deposit so that affiliated researchers can request the needed article directly from the publisher or vendor. Expanded use of patron-driven direct document delivery from vendors and publishers permits delivery with little or no staff intervention and may eventually offer an alternative to conventional e-journal subscriptions.

The e-book and direct article delivery models are in flux as publishers and vendors are still testing the market with a variety of ways to offer e-books and journal articles. Spending on electronic materials will continue to outpace spending on print.^[26] Libraries are still pondering effective models for acquisitions and making changes to workflows and budgets accordingly.

THE FUTURE

As library technology and electronic resources become more pervasive and more complex, demands for automated acquisitions systems meeting a variety of needs will continue. System vendors and libraries will continue to improve functions that assist in comprehensively managing electronic resources. The concept of a publisher will be pushed to new limits by electronic information. Exploration of patron-driven acquisitions will continue. Article databases and document delivery will supplement and may replace current subscriptions models. Consortial purchasing will grow and open new opportunities for development in both library and vendor systems. Librarians, publishers, and vendors will develop new standards to speed sharing and accuracy. Yet unknown forms of online resources and services will be required.

As electronic resources replace print materials, the need for traditional automated acquisitions may diminish as acquisitions becomes nothing more—nor less—than providing users fast and convenient ways of accessing the world's vast body of information in the cloud.

Automatic Abstracting and Summarization

Daniel Marcu

Information Sciences Institute, University of Southern California, Marina del Rey, California, U.S.A.

Abstract

After lying dormant for a few decades, the field of automated text summarization has experienced a tremendous resurgence of interest. Many new algorithms and techniques have been proposed for identifying important information in single documents and document collections, and for mapping this information into grammatical, cohesive, and coherent abstracts. Since 1997, annual workshops, conferences, and large-scale comparative evaluations have provided a rich environment for exchanging ideas between researchers in Asia, Europe, and North America. This entry reviews the main developments in the field and provides a guiding map to those interested in understanding the strengths and weaknesses of an increasingly ubiquitous technology.

GENRES AND TYPES OF SUMMARIES

It is almost impossible to conceive of a world without summaries. Daily, we skim over headlines to decide what news to read. We go over scientific abstracts to decide what papers to study. We read reviews to decide what books to buy. And we browse television guides to decide what movies to watch.

Most of the summaries that we use today are produced manually by trained abstractors. However, an increasingly large number of researchers is now tackling the problem of automatic summarization. This turns out to be quite difficult because even defining the scope of the problem is not an easy feat. Consider, for example, the text fragment in Fig. 1a, which is taken from *Time* (October 2, 1997).

What is a good summary of the text in Fig. 1a? A *headline* such as that in Fig. 1b may convince a layperson who is hit annually by a flu to read the whole article. However, a molecular biologist interested in the function of various enzymes may be more interested in an abstract such as that shown in Fig. 1c.

As the examples in Fig. 1b and 1c illustrate, the communicative goal with which a summary is written and the background knowledge of the intended audience clearly influence the information that one may consider to be important.

The intended communicative goal and the background of the audience are only two of the facets that are useful when characterizing summaries. Other facets that have received significant attention are listed below [see Hovy,^[1] Mani,^[2] and Jones^[3] for a list of dimensions along which summaries can be characterized].

- *Usage*. When they can be used only for quick categorization, summaries are called *indicative*. When they

can be used as substitutes of the original documents to access significant content, summaries are called *informative*.

- *Relation to source*. When summaries contain sentences/clauses that are “lifted” verbatim from the input source, they are called *extracts*. When the important information in a text is paraphrased to ensure cohesion, coherence, and a higher degree of compression, summaries are called *abstracts*. A particular type of abstract, which is extremely short and uses a peculiar syntax is the *headline*. For example, the texts in Fig. 1d and Fig. 1e are extractive summaries of the text in Fig. 1a, the text in Fig. 1b is a headline, and the text in Fig. 1c is a short abstract.
- *Purpose*. When summaries provide the author’s view, they are called *generic*. When they reflect the user’s interest, often expressed in the form of a query, they are called *query oriented*.
- *Source type*. When they are based on only one text, they are called *single-document summaries*. When they fuse information provided in multiple texts, they are called *multidocument* or *multidoc summaries*.

The dimensions above are not always clearly cut. A summary can be at the same time indicative and informative. Or it can be indicative for one audience and informative for another. A summary that is obtained by selecting important sentences and then simplifying them by deleting unimportant words and phrases is not really an extract because it contains clauses/sentences that are not part of the input. But it is not an abstract either because paraphrasing is not employed extensively. By the same token, one may argue that it is not appropriate to call “abstract” and extract in which only the pronominal dangling references have been replaced by the corresponding noun phrases.

a.	Running nose. Raging fever. Aching joints. Splittig headache. Are there any poor souls suffering from the flu this winter who haven't longed for a pill to make it all go away? Relief may be in sight. Researchers at Gilead Sciences, a pharmaceutical company in Foster City, California, reported last week in the <i>Journal of the American Chemical Society</i> that they have discovered a compound that can stop the influenza virus from spreading in animals. Tests on humans are set for later this year. The new compound takes a novel approach to the familiar flu virus. It targets an enzyme, called neuraminidase, that the virus needs in order to scatter copies of itself throughout the body. This enzyme acts like a pair of molecular scissors that slices through the protective mucous linings of the nose and throat. After the virus infects the cells of the respiratory system and begins replicating, neuraminidase cuts the newly formed copies free to invade other cells. By blocking this enzyme, the new compound, dubbed GS 4104, prevents the infection from spreading.
b.	Headline: Flu stopper — A new compound is set for human testing
c.	Short abstract: The neuraminidase enzyme enables the flu virus to replicate and invade uninfected cells.
d.	Coherent extract: Researchers at Gilead Sciences, a pharmaceutical company in Foster City, California, reported last week in the <i>Journal of the American Chemical Society</i> that they have discovered a compound that can stop the influenza virus from spreading in animals. Tests on humans are set for later this year.
e.	Incoherent extract: The new compound takes a novel approach to the familiar flu virus. By blocking this enzyme, the new compound, dubbed GS 4104, prevents the infection from spreading.

Fig. 1 Sample text and various types of summaries.

SUMMARY EVALUATION

The discussion in the previous section is much more important than first meets the eye. The facets and summary types enumerated above do not merely provide a common vocabulary to natural language researchers. Rather, they set the foundation for addressing a serious concern: If there are so many facets and factors that influence the way summaries are constructed and presented, how can one measure the quality of a summary? What makes a summary good and another one bad? Unless these questions can be answered adequately, it is impossible to assess progress in the field of automatic abstracting.

The first metrics for measuring the quality of a summary have been proposed in the context of producing generic extracts. Given a document, one or more human judges are asked to mark the sentences that are important. The sentences on which a majority of the judges agree to be important are taken to be the “gold standard.” The quality of automatic summarizers is measured in terms of recall—the number of important sentences correctly identified by the summarizer divided by the total number of sentences in the gold standard—and precision—the

number of important sentences correctly identified by the summarizer divided by the total number of sentences selected by the summarizer. Note that both recall and precision have to be taken into consideration as one can easily rig one of the metrics. By marking as important all sentences in a text, one can easily obtain a 100% recall. Clearly though, the precision is going to be much smaller. A metric that summarizes the recall and precision metric is the F-value metric, which is a harmonic average of precision and recall ($F = 2 R P / (R + P)$). The F-value is a number between recall and precision that it is higher when recall and precision are closer.

The F-value cannot be rigged the same way recall and precision can when considered in isolation. Unfortunately, the use of the F-value metric can also pose problems. Let’s say that five human judges mark as important sentences in a document that has 20 sentences. Let’s say that each judge marks 10 sentences as important but a majority of the judges agree on only two sentences. Is this two-sentence gold summary of any good? If five judges randomly choose sentences from a document and mark them as important, just by the laws of odds it is likely that two sentences will be marked as important by a majority of

them. This is clearly a problem as it corresponds to a case where there is no agreement between human judges with respect to what is important in a text (see Carletta,^[4] Krippendorff,^[5] and Siegel^[6] for methods of computing agreement between multiple judges). If humans cannot agree on what is important, it means that a summarizer that chooses sentences randomly is as good as a human.

Some of the summarization studies that are referred to in this entry were carried out before statistical methods for measuring interannotator agreement and adequate experimental design techniques became part of the tools used by natural language researchers. For example, a classic summarization paper published by Edmundson^[7] measured the performance of various summarization methods in terms of recall with respect to a gold standard built by only one human. Forty years after the experiment of Edmundson was carried out, it is impossible to tell how difficult the texts given as input were to summarize—no human agreement figures are reported in the paper. Still, as the reader can see in this entry, we still take many such results as indicative of the performance of various methods. Understanding how to measure the quality of a summary is by itself a research area^[8] that evolves concurrently with research aimed at developing increasingly sophisticated summarization techniques.

The recall, precision, and F-value metrics represent only a small fraction of the metrics proposed to measure the quality of a summary. Alternative metrics have been proposed to address their limitations. For example, Radev et al.^[9] proposed an evaluation metric in which sentences are not judged on a boolean scale as important or nonimportant, but are given a utility score. A summarizer that selects sentences of high utility is given a higher reward than a summarizer that selects sentences of medium or low utility.

To enable the evaluation and encourage the development of systems that produce not extracts but abstracts, the Document Understanding Conferences^[10,11] use human judges to measure the degree of overlap between a model summary and abstracts/extracts produced by various systems. In addition to the informational content, systems participating in DUC are also evaluated in terms of output grammaticality, cohesion, and coherence.

The metrics discussed so far pertain to the intrinsic quality of a summary. However, in many scenarios, summaries are also evaluated extrinsically, with respect to their utility for solving specific tasks. For example, systems that participated in the SUMMAC evaluation^[12] were evaluated by measuring how often their outputs could be used by humans to determine whether the documents for which the summaries were generated were relevant to a given topic. In another task, summarization systems were judged by measuring how often their outputs could be used to successfully carry out a document categorization task.

Reviewing all research in summary evaluation is beyond the scope of this entry.^[1,2,8,10–12] In the rest of this entry, whenever the “performance” of a summarization system is referred to without using any additional qualifiers, the F-value of that system, as measured against a gold standard, is meant. When the performance of a system was measured using a different metric, this is made explicit. Because the science of evaluating summaries is not stable and because a generally accepted evaluation standard is yet to emerge, comparing the performance of various summarization algorithms and techniques is challenging.

SUMMARIZATION-SPECIFIC COMPONENTS

Overview

In dealing with the facets discussed previously, researchers in summarization developed numerous components/techniques that are now part of many summarization systems. Importance identifiers are used to determine the most important sentences and clauses in a document or collection of documents. Sentence compression algorithms are used to compress extracts further, by deleting nonimportant phrases and clauses in long sentences. Paraphrasing components are used to increase the compression and readability of the output. Information extraction and natural language generation systems are used to generate abstracts via semantic-based representations. Headline generators use specialized techniques to determine the most representative concepts in a text and to render them using a language that is often different from that used in typical English.

Fig. 2 shows the components that have received significant attention (the components are represented as ellipses) and the summary types these components are meant to produce (the summary outputs are represented in bold fonts surrounded by boxes). Each summarization pipeline in Fig. 2 takes as input a document and some optional parameters, such as the desired compression, a user query, etc. Additional components that were developed to generate multidocument summaries are discussed later in this entry.

Importance Identifiers

Arguably, most of the effort in the summarization research field has gone into the development of algorithms and methods for identifying important sentences/clauses in single document texts.

Position-based method

Many of the summarization systems assume that sentences that occur at the beginning of documents are more likely

Fig. 2 Components (ellipses) and sought outputs (bold rectangles) of single document summarization systems.

to be important than sentences that occur at the end. The simplest way to operationalize this assumption is to build a summarizer that always selects the first sentence in a text; or the first k sentences in a text, when a smaller degree of compression is required.

Empirical evaluations of algorithms that implement this assumption have revealed that the position-based method is the best^[7,13] or second best^[14] single method for identifying important sentences in text. Although the performance of this method varies significantly with text genre and compression rate, this method is usually capable of identifying around 33% of the important sentences in a text.^[7,13,14]

An extensive study aimed at deriving a genre-dependent optimum position policy have been carried out by Hovy and Lin^[15] who showed that in technical articles that announce computer-related products, the sentence that is most likely to be important is the first sentence of the second paragraph, then the first sentence of the third paragraph, then the second sentence of the second paragraph, and so on; in news articles, the sentence that is most likely to be important is the first sentence of the first paragraph, then the first sentence of the second paragraph, and so on.

Title-based method

Edmundson^[7] was the first to show that the words in titles and headings are more likely to be used in important sentences in a text than in nonimportant sentences.

Systems that employ this heuristic in combination with others tend to yield summaries of higher quality. For example, the title-based method increased the performance of Edmundson's position-based summarizer by 8% and the performance of Teufel and Moens's^[14] cuephrase-based summarizer by 3%.

Cuephrase method

Cuephrase-based systems capitalize on the observation that important sentences contain "bonus phrases," such as *significantly*, *in this paper we show*, and *in conclusion*, whereas nonimportant sentences contain "stigma phrases," such as *hardly* and *impossible*. The cuephrase method yielded the best results when used to identify important sentences in scientific articles^[14]—it identified 55% of the important sentences in a text—and was shown to increase the performance of summarization systems by 7% to 9% on other genres, when applied in conjunction with other methods.^[7,13]

Word-frequency method

To my knowledge, the claim of Luhn^[16,17] that important sentences in a text are those that contain words that occur "somewhat" frequently has not been validated empirically in any summarization system. In Edmundson's experiments,^[7] this method decreased the performance by 7% when combined with other methods. In Kupiec et al.'s experiments,^[13] this method decreased performance by 2%.

The method appeared to mildly help only in Teufel and Moens's system,^[14] where it increased performance by 0.2% when combined with other methods. In spite of not being properly validated, the word-frequency method continues to be used in many implemented systems.

Cohesion-based methods

The working hypothesis that constitutes the foundation of all cohesion-based methods is that important sentences/paragraphs are the highest connected entities in more or less elaborate semantic structures. There are several approaches to characterizing the level of connectedness. They are based on word co-occurrences, local salience and grammatical relations, coreference, lexical similarity, and combinations of the above.

Word-based. The most straightforward approaches apply Information Retrieval techniques to compute the similarity between the paragraphs in a text.^[18–20] The paragraphs that have the highest collective similarity to the other paragraphs are assumed to be central/important to the document in which they belong. When evaluated against a collection of encyclopedia articles, this method did not improve significantly over a position baseline.^[20] The assumption that important sentences are those that contain important concepts have been also explored in a different representation space, using methods specific to latent semantic analysis.^[21]

Lexical chains-based. Lexical chains are successions of semantically related words that create a context and contribute to the continuity of meaning.^[22] For example, a lexical chain defined over the text in Fig. 1a, may contain the semantically related words (nose, fever, headache, flu, pill). Lexical chains are automatically built^[23–25] using large lexical databases, such as thesauri and the Wordnet.^[26] Lexical-chain-based approaches to text summarization^[23,25] assume that important sentences are those that are “traversed” by “strong” chains, where the strength of a chain is defined by its length and number of distinct words in it. Empirical evaluations have shown promising results but have not provided yet uncontroversial evidence that this summarization method yields higher performance than others.

Connectedness-based. The connectedness-based method^[27] fuses many of the elements specific to cohesion-based methods. Systems that use this method first map the words in a text into nodes in a graph and then create arcs between the nodes whenever an adjacency, grammatical, coreference, or lexical-similarity-based relation holds between the words corresponding to the nodes. The sentences that contain the most connected words are considered important. The method has been shown to produce good results when evaluated extrinsically, on a document categorization

task.^[12] The author is not aware of intrinsic evaluations of this approach.

Discourse-based

The working hypothesis of the discourse-based method is that the hierarchical discourse structure of texts^[28] can be used to determine the important sentences/clauses in a text.^[29–32] Intuitively, if a paragraph p in a text elaborates on a sentence i in the same text, it is reasonable to assume that a summary should contain only the sentence i as the information in paragraph p is subsidiary to that in i .

Marcu^[30] presented various algorithms for automatically deriving the hierarchical discourse structure of texts, and Marcu^[30] and Carlson et al.^[33] discussed methods for exploiting the discourse structure to determine the most important sentences/clauses in a text. For short texts, the performance of discourse-based summarization systems approaches that of humans.

Integration of the methods

None of the methods above has proved to provide consistent, high-performance results across all text genres, document lengths, and compression rates. In fact, experiments carried out by Jing et al.^[34] suggested that many of these methods are quite unstable. Systems that perform well in a given summarization setting may perform poorly in a different one. To increase robustness, many summarization systems do not rely on only one of the above methods. Rather, they use supervised machine learning techniques, such as naïve Bayes,^[13,14] decision trees,^[35,36] inductive learning,^[35] and rhetorical parsing tuning,^[30] to adjust the contribution of each summarization method in determining the most important sentences in a text. In stable experimental conditions, summarization systems that use machine learning to integrate various methods/techniques always outperform systems that use only one summarization method.

Sentence Simplifiers/Compressors

Professional abstractors do not create abstracts by simply copying the most important sentences in a text. Often, they delete nonimportant segments in the important sentences to yield summaries of higher compression.^[37–39] For example, a sentence such as that in Fig. 3a, can be simplified as shown in Fig. 3b.

To simplify sentences, some researchers^[40–45] manually developed collections of rules that posit, for example, that during compression all adjectives and relative clauses in a sentence should be dropped. As one may expect, this approach can often yield ungrammatical outputs. To address this problem, other researchers^[39,46] tackled the sentence simplification problem in a probabilistic framework, using a noisy-channel approach similar to that

a.	Although the modules themselves may be physically and/or electrically incompatible, the <i>cable-specific jacks</i> on them <i>provide industry-standard connections</i> .
b.	<i>Cable-specific jacks provide industry-standard connections.</i>

Fig. 3 Sentence compression example.

employed in speech recognition,^[47] machine translation,^[48] part-of-speech tagging,^[49] and information retrieval.^[50]

Using an automatically collected corpus of sentences and their human-generated compressions, Knight and Marcu^[39,46] developed generative probabilistic models that explain how short sentences can be rewritten as long sentences through a sequence of syntax-based stochastic operations. Mathematically, any long sentence *L* can be generated from a short sentence *S* with a probability *P*(*L*|*S*). A language model component assigns a probability *P*(*S*) to any possible sentence: grammatical sentences have high probability, whereas nongrammatical sentences have low probability. Once the probability distributions *P*(*L*|*S*) and *P*(*S*) are estimated, given a sentence *l*, sentence compressions of arbitrary length can be generated by looking for sentences *s* that maximize the product *P*(*l*|*s*) *P*(*s*) [i.e., sentences that are both good compressions (*P*(*l*|*s*) is high) and grammatical (*P*(*s*) is high)]. Empirical evaluations of Knight and Marcu’s sentence compression algorithms showed that the noisy-channel approach outperforms two baseline algorithms that compress sentences by dropping words randomly or by choosing subsequences of maximal *n*-gram probability. However, Knight and Marcu’s compression system still does not come close to human performance levels.

Sentence Paraphrasers

The simple deletion of syntactic constituents in long sentences is not the only way professionals create abstracts.

Often, information from multiple sentences is fused together or, for coherence, cohesive, and stylistic effects, information in one or multiple sentences is paraphrased. Numerous researchers studied in detail the types of paraphrase operations employed during summarization^[38,51,52] and applied them in implemented systems.^[38,52] However, systems capable of generating multiple paraphrases of arbitrary sentences are yet to be developed.

For example, it is not clear at all what kind of computational processes one should use to produce the short abstract in Fig. 1c, which paraphrases some of the information in the text in Fig. 1a, while making explicit information that is not rendered in the original text. Or consider the examples of compression/paraphrasing in Figs. 4 and 5, in which two sentences were compressed/paraphrased into one (the text in italics has been preserved or modified slightly during compression).

Both examples of compression/paraphrasing in Figs. 4 and 5 were produced by professional abstractors. Mimicking this process automatically is not within the capability of many summarization systems. Fortunately, the recognition and generation of paraphrases is currently on the radar of many research communities. Researchers in natural language generation and summarization,^[53] data mining and question answering,^[54] and information extraction^[55] methods for automatically learning paraphrase-specific information by exploiting bilingual, parallel texts,^[54] or large corpora of monolingual text.^[54,55] It is likely that progress in this area will have a significant impact on the next generation of automatic abstraction systems.

a.	He <i>holds a bachelor's degree in chemistry</i> .

a.	<i>Nonetheless, policies on its use vary.</i>
b.	<i>Agencies such as the Internal Revenue Service and the Farm Credit Administration promote shareware use, but one NASA center shuns it.</i>
	Compression with paraphrasing: Federal agencies generally use shareware, but policies on its use vary.

Fig. 5 Compression/paraphrasing example 2.

Coherence/Coreference Enforcers

Although extraction-based summaries contain, by construction, only well-formed grammatical sentences, they often do not sound right. For example, the summary extract in Fig. 1e of the text in Fig. 1a sounds odd because it is not clear to what entities “the new compound,” “this enzyme,” “the new compound,” and “the infection” refer. Also, even if we could felicitously solve these references, the two sentences still do not seem to go well together because the discourse relation between the two is not clear.

Numerous techniques have been proposed to rewrite extracts so as to yield more readable summaries. Many of the systems tested as part of the large-scale summary evaluations carried out in conjunction with the DUC^[10,11] use anaphora resolution techniques to replace with name entities some of the pronouns in the extracts they produce. More sophisticated summary revision operations, such as aggregation of constituents of two sentences on the basis of referential identity and reduction of coordinated constituents were proposed by Mani et al.^[56] Aggregation operations specific to events have been proposed by Maybury.^[57] Sentence-reordering algorithms have been proposed by Barzilay et al.^[58]

In an attempt to deal with sentence and document compression in a uniform framework, Daumé and Marcu^[59,60] showed how the noisy-channel approach to sentence compression of Knight and Marcu^[39] can be extended to the text level. Their empirical evaluations show that a document compression system that integrates the deletion of syntactic constituents with the deletion of clauses and sentences outperforms a compression system that sequentially simplifies the sentences in a text.

HEADLINE GENERATORS

The vast majority of the work on headline generation has been carried out in a statistical-based noisy-channel framework.^[61–64] Given large collections of «text, headline» tuples, which can be easily collected from the Web,

one can estimate probability distributions, $P(w_d|w_h)$, that reflect the likelihood of a word w_d occurring in a document when another word w_h occurs in a headline. By treating documents and headlines as bags of words, one can easily estimate the probability, $P(D|H)$, of a document given a headline. A classic trigram language model, $P(H)$, can be trained to differentiate between well- and ill-formed headlines. Once the parameters of these models are estimated, one can construct document headlines by searching for sequences of words h that maximize the product, $P(d|h)P(h)$. The headlines generated in this manner tend to contain the most representative words in a document; however, the n-gram language models that were employed so far in headline generators seem to be too weak to enforce that the generated headlines are grammatical.

A different approach to headline generation is taken by Daumé et al.,^[65] who first identified the input document type. This type can fall into one of these four classes: single event, multiple event, biography, and natural disaster. In addition to the type, Daumé et al. also automatically determined the most salient entities and relations in the input. Depending on the input type, they use a set of predefined templates to produce grammatical headlines. For example, when a multievent template of the form “MainEvents in Location1, Location2, and Location3” is instantiated using entities specific to a collection of documents about eclipses, it yields the headline “Eclipses in Hawaii, Mexico, and Bay Area.” The method produces impressive results when the document type and salient entity identifiers work correctly, but produces odd results when these components fail.

SUMMARIZATION VIA SEMANTIC REPRESENTATIONS

Most of the light semantic-based summarization systems developed to date implement the pipeline architecture in Fig. 2. An information extraction system specialized in dealing with certain events, such as “terrorism” or “natural disasters,” first extracts from the document(s) to be

Fig. 6 Example of template from the “terrorism” domain.

summarized text fragments that fit a predefined template (see Fig. 6 for an example). Once the template has been filled, a natural language generation component is used to map the information in the template into well-formed natural language sentences.^[66,67]

Because the types of entries associated with information extraction templates are limited, before generation, one can apply additional operations to modify, delete, and aggregate information extracted from text.^[67] This is particularly useful in the context of multidocument summarization, where the information extracted from multiple articles may be inconsistent.

This approach produces good summaries in the limited domains for which the information extraction and natural language generation systems have been tuned. Unfortunately, the approach does not generalize easily to arbitrary domains. In general, the role of semantics in summarization is still to be determined. What constitutes an appropriate, computable representation for the semantics of texts that can be exploited in the context of summarization applications remains a controversial issue. Some researchers^[68] map texts into description logics and perform condensation operations on formal representations. Other researchers^[65,66,69] tend to use intermediary representations that are closer to the surface and/or syntactic forms. No researcher in the field claims that high-performance summarization systems can be built without a deeper understanding of the semantics of texts than current technology supports. But where the middle ground between formal elegance and coverage is remains an open question.

MULTIDOC SUMMARIZATION

A multidocument summarization system takes as input a collection of documents and produces a summary of the entire collection. In some instances, producing generic multidocument summaries is easier than producing generic single document summaries. If a collection of documents is about the same event, let's say an earthquake, it is likely that many of the input documents contain sentences describing the number of victims, location, time, and strength of the earthquake. Clustering techniques that measure the word overlap between sentences are usually sufficient for choosing from the set of all sentences in a collection one that is similar to many others. If a sentence and its variants were produced by many

authors, it is likely to be important. In such instances, important information can be, hence, detected using simple word overlap. In other instances, producing multidocument summaries is more difficult than producing single document summaries. When the collection given as input is heterogeneous and describes multiple events of the same kind, for example, earthquakes that happened in various locations over a time interval, it is no longer easy to determine what information is most important.

Besides the challenges specific to single document summarization, multidocument summarizers have to address a whole range of additional problems. When one summarizes document collections, it often happens that the information given in them is inconsistent. One document may claim that a car crash has produced six victims, whereas another document may claim seven. Which document should one believe? How can one determine that the two documents talk about the same car crash to begin with?

Determining the absolute time of the events reported in the input documents becomes an important factor in deciding what should go in a summary. If a collection reports the saga of a military conflict, what should go in a short summary? The cause of the conflict? The major steps in the conflict? Or only the outcome?

Equally important is the explicit mentioning of the dates/times at which the events occurred.^[70] If the dates/times associated with the reported events are not explicitly mentioned, there is a serious danger for human readers to make incorrect inferences. The simple juxtaposition of some sentences may mislead readers to believe that, for example, an event in one sentence caused the event in the subsequent sentence, if the reader cannot infer from the summary that the events took place 10 years apart.

Collections about similar events tend to contain significant amounts of redundant information. But recognizing where redundancies occur is by no means a trivial problem because the relation between sentences in arbitrary documents is difficult to characterize.^[71] sentences can be semantically equivalent, they can subsume each other, or the information they convey can partially overlap. Recognizing the exact relation that holds between two arbitrary sentences is still an open problem.

The field of multidocument summarization has created the context and need for research in various areas. It led to the development of methods that are well suited for generating nonredundant summaries;^[72,73] methods that can be used to detect and track events over time while producing “evolving,” temporal summaries;^[74] methods for fusing sentence fragments^[66,69] to produce grammatical sentences; and in-depth studies of specific summary types (biographical).^[2]

Since 2001, the DUC^[10,11] in North America and the NTCIR Workshop on Evaluation of Chinese & Japanese Text Retrieval and Text Summarization^[75] in Asia

provided an excellent forum for evaluating and comparing various multidocument summarization algorithms. Participants in large-scale evaluations worry not only about building useful systems, but also about figuring out how to measure their performance.^[76,77] It appears that a significant gap exists between the summarization systems that participate in DUC and NTCIR evaluations, which are capable of handling unrestricted document collections using simple surface-based techniques, and the systems developed to advance the state of the art in information fusion,^[66,69] paraphrasing,^[53] or text compression.^[59] It would be interesting to see how and when the latter work gets integrated into robust summarization systems capable of handling arbitrary text types.

OTHER KINDS OF SUMMARIES

Throughout this entry, the focus has primarily been on techniques and algorithms developed for producing single document and multidocument generic summaries. By no means does this cover all the work in text summarization. For example, Teufel and Moens^[78] went beyond generic summarization to devise algorithms for classifying sentences in scientific articles according to their rhetorical goal (Background, Topic/Aboutness, Related Work, Purpose/Problem, Solution/Method, Result, Conclusion/Claim). A system capable of recognizing these roles can be used to generate summaries tailored to specific communicative goals.

An increasingly significant body of work has been focusing on summarizing dialogues and meeting transcripts,^[79–81] video^[82,83] diagrams,^[84] soccer games,^[85] and web pages for personal digital assistant access.^[86] As we make progress in developing new methods for representing and accessing nontextual media types, it is likely that we will develop additional techniques for summarizing nontextual information that exploits peculiarities specific to various media types. For example, Amitay and Paris^[87] proposed a method for summarizing Web pages that makes use of the text in the links that point to a page.

CONCLUSION

The field of natural language summarization has come a long way since the initial experiments of Luhn.^[16] Although we still struggle to define summaries and attempt to evaluate them, there is much reason for optimism. Summarization systems are no longer the appanage of a small research community. Summarization technology is used daily to summarize news (<http://www.cnn.com>), to consolidate and summarize news published by multiple sources (<http://www.cs.columbia.edu/nlp/newsblaster/>), to provide handheld device access to information (<http://www.diglib.stanford.edu/~testbed/doc2/>

<http://www.voxera.com>), to enable voice-based navigation of the Web (<http://www.voxera.com>), and to provide feedback to students on their written essays (<http://www.etstechnologies.com>). Given the increasing success of the technology, there is a certain danger to believe that summarization is a solved problem. It is certainly not. The success of the technology is not determined so much by the quality of the output as by the willingness of the users to tolerate anything that enables them to deal easier with the deluge of information to which they are subjected. As the expectations of the users increase, the need for developing new techniques for automatic abstracting will also increase. Building a summarization system that is better than one that selects the first n sentences in a news article continues to be a significant intellectual challenge.

Automatic Discourse Generation

John A. Bateman

University of Bremen, Bremen, Germany

Abstract

Automated discourse generation, also known as natural language generation (NLG), is a subfield of computational linguistics focusing on theories and methods for creating natural “texts” of all kinds automatically by machine. This entry provides an overview of the main application areas of natural language generation, motivations for adopting natural language technology, the theoretical problems addressed, and the technical solutions adopted.

INTRODUCTION

Automated discourse generation (also commonly known as “text generation” or “natural language generation”: hereafter: NLG) is a branch of computational linguistics, or natural language processing, concerned with the question of how “texts” in natural human languages can be created automatically by machine. Very many NLG systems have now been created, ranging from fielded application systems to research prototypes aimed at investigating particular aspects of the language generation problem. In general, an NLG system has the task of converting representations of information maintained in some computationally accessible form (e.g., in databases, numerical sources, knowledge representations, or ontologies) into appropriate textual renditions of that information expressed in natural human languages. NLG as a field therefore concerns itself with the construction of such systems, with the identification of appropriate system architectures, their component modules, interconnections between modules, suitable processing schemes, reliable algorithms, and evaluation methods.

The range of texts addressed in the field of NLG is very broad and continues to expand. Generated texts may be written (still the majority) or (increasingly) spoken; they may be extended in length, be single paragraphs (the majority), or consist instead of single phrases or sentences—as is often the case in database responses, diagram caption generation, machine translation, question-answering, etc. The texts produced may consist of simple character strings or invoke more sophisticated text formatting, punctuation, or page layout; they may exhibit a linear structure (the majority), be part of a dialogue or interactive setting (increasingly), or be (partially) organized as hypertext. The texts may also be explicitly tailored for audiences differing in expertise, knowledge, interest, or cognitive load; they may be produced in a variety of natural languages; they increasingly combine natural language (sentences, paragraphs) with nonlinguistic material such

as graphs, pictures, or diagrams; and they may even target nonverbal languages such as sign language. In short, wherever we find natural human language being employed, we are dealing with a potential field of application for NLG. Established NLG applications include the generation of weather reports from meteorological data in multiple languages, customer response letters, health information leaflets and letters, environmental reports, software documentation, dialogic human–computer interfaces, and many more.

NLG also provides a significant set of methods for linguistic research, particularly overlapping with text linguistics, discourse analysis, pragmatics, and semantics. Moreover, most theories of syntactic description developed within linguistics have also been explored within NLG systems, providing additional valuable input concerning the formal and computational properties of those theories. This applies also to functional theories of linguistics, an area underrepresented in computational linguistics otherwise. This is due to the basic orientation within NLG to uncovering the language *choices* that are available when constructing texts and the *motivations* for those choices; this makes clear connections with the general goals of functional linguistics. In all these areas, a computational account of the human linguistic system that is sufficiently well specified to allow the automatic generation of natural texts needs to combine a breadth and detail of linguistic description unusual in noncomputational text linguistics, semantics, and syntactic theory and thus serves to push the articulation of linguistic theory further along a broad front of issues.

A variety of techniques are employed when constructing NLG systems, ranging as we shall see below from simple “fill-in-the-gaps” to deep intention-based reasoning. However, whereas systems employing simpler techniques are increasingly finding general use, as in dynamically generated Web pages or mail-merge, more sophisticated NLG systems are still rarely deployed. This is due partly to the inherent complexity of the task of language production and

the overheads that constructing usable systems necessarily bring on the one hand, and partly to a lack of awareness of NLG technology and approaches on the other. As NLG becomes more well known and the supporting technology more streamlined, we can expect increasingly rapid transfer of research results into challenging applications. Research on applied NLG is therefore a particularly dynamic and active area.

The kinds of applications where it is worthwhile investigating the use of NLG can be characterized as follows. First, when there is a high volume of constantly changing but highly restricted text, as in weather reports or other numerically based summaries, then an NLG system specifically tailored to the demands of the required text type can offer significant benefits. This is further multiplied if, on the basis of the same underlying data, versions of the text are required in multiple languages (as in the early weather report systems employed in Canada for parallel English/French versions). Second, when some combination of variables means that very many possible texts might be required (as in “comparison” texts that describe on demand differences between two objects, products, situations, etc.), although each single text is relatively simple, automatically generating the required text can be a better option. Third, when the particular text required depends on some user-specific variable, such as level of expertise concerning a subject (as in medical reports from a single medical record for patients and doctors), or on the time available to the user or the cognitive load that the user is under (as in car navigation systems where the driver might at some point need to deal with a difficult traffic situation or be traveling at speed), or on particular difficulties (such as hearing, restricted vision, etc.), then the flexibility inherent in full automatic NLG might be the only option for producing appropriate natural language output. This is particularly the case when the effects of any of these variables needs to be *combined*.

In general, the more flexible, context-dependent, and user-adaptive a piece of language needs to be, then the more appropriate sophisticated NLG techniques become. In dialogue situations, e.g., a system needs to respond quickly and effectively to user input, selecting appropriate levels of complexity, detail, and styles for its answers. But simpler techniques can only reproduce more straightforward interactions. We are already seeing a marked increase both in the requirements being placed on such systems and in the expectations of their users and so more sophisticated techniques will certainly be necessary.

NATURAL LANGUAGE GENERATION: BASIC COMPONENTS

We can characterize NLG in two ways: first, there are the kinds of problems that need to be solved when producing natural language and, second, there are the kinds of

computational techniques and components that are being developed to provide those solutions. There is a close relationship between these views. The more flexible and situation-dependent the language to be produced is, the more complex the computational techniques necessary become. Simple, inflexible language does not require advanced techniques. For example, the simplest method of generation appears in every automated bank teller machine and is responsible for printing out Welcome. Please insert your card (and all the other messages). Obviously, the text can be made arbitrarily sophisticated, with as many sentences as required. However, the system has no way of exploiting commonalities across sentences, and hence no way of recombining parts of existing sentences to produce new ones—not even to change Good morning! into Good afternoon!. “Canned text” systems of this kind illustrate how simplicity comes at the expense of power.

The obvious generalization is to create templates instead of canned sentences or paragraphs. Every form letter that contains spaces into which your name and address and the date are automatically entered is an example of such a text template. Though enabling some saving of space, template systems by and large suffer from the same lack of combinatory power that hampers canned text systems. As a consequence, template systems are made progressively more complex by including various conditions on which particular template is to be used. For example, changing the grammatical subject of a sentence to be filled by a plural noun phrase rather than a singular noun phrase will also require a change to the verb, otherwise a nongrammatical sentence results. For languages with more morphology than English (i.e., the majority of languages), the number of templates multiplies explosively. Nevertheless some quite successful generation systems have been built on sophisticated notions of templates that avoid the pitfalls of simple template combination.^[1]

The kinds and degrees of flexibility required in any particular application or research project in NLG vary widely, however, and so there is an accompanying diversity of opinion concerning the components and architectures best adopted for building NLG systems. Attempts to provide overall systematicity or standardization in the field are still of arguable generality.^[2] Nevertheless, one commonly adopted structure is Reiter’s so-called *pipeline* architecture,^[3] which sees generation as a process whereby data is progressively transformed, structured, and augmented in order to produce the final text. This is shown graphically in Fig. 1.

Historically, development has moved from the bottom of this architecture to the top. The first NLG systems were very much concerned with organizing grammatical sentences so that their production could be controlled. Here various views of grammar and syntax from linguistics were employed, often augmented with conditions so that particular structures could be selected according to the precise textual information to be expressed. NLG was

Fig. 1 Reiter's pipeline architecture for NLG.

therefore seen from very early on as a problem of choice under a variety of communicative constraints. Deciding on appropriate grammatical structures and lexical material is called *tactical generation* and answers the basic question of *how* information is to be presented. The corresponding computational components are responsible for *realization* and are therefore called *realizers*. Such realizers can either be targeted toward specific, narrowly defined areas of grammatical competence for particular kinds of texts, or can aim for general grammatical coverage. In the latter case, the grammatical resources drawn upon can become extremely extensive, rivalling standard reference grammars.^[4,5] Some realizers aim for ease of use rather than broad coverage.^[6] The input to realizers also varies: some require substantial grammatical information, thereby pushing grammatical decisions “upstream” in the entire generation process,^[6] others abstract away from grammatical information so that input can already be semantic.^[4] In the latter case, the realizer takes over responsibility for the grammatical decisions to be made.

In both cases, there are a range of phenomena to be covered to do with the fine-detailed organization of the sentences to be produced: Are simple sentences to be grouped together into more complex sentences? Are pronouns to be used to refer to repeated entities? Which words are to be selected when there are several similar in meaning available? All these issues are referred to as *microplanning*. The output of a microplanning component needs to be a specification suitable for passing to some realiser. Within this specification, decisions are recorded concerning which option is taken from a range of options

that are all grammatical but which differ in their textual import. They cannot therefore be made by a grammar alone but need to be responsive to the overall communicative plans guiding the generation process.

Microplanning then contrasts with *macroplanning* or, *text planning*, which is responsible for deciding on the overall organization of a generated text. It is the text planner that decides on *what* is to be expressed and how that content is to be organized—argumentatively, narratively, rhetorically, etc.—in order to make its point. This area of the generation task is termed *strategic generation*. Commonly, a text or document plan is created either by kinds of templates for entire text structures or by planning methods developed from Artificial Intelligence. In the latter case, the plans rely on the specification and satisfaction of communicative goals which, as a by-product, select particular “chunks” of content to be expressed. A completed text plan then includes structured chunks of content plus specified relations holding between those chunks. These relations eventually drive the selection of linking phrases and conjunctions, such as “therefore,” “because,” etc. by the realizer. Text plans can also be used to select suitable formatting options, such as bulleted lists for sequences of similar information, etc.

NATURAL LANGUAGE GENERATION: AN EXAMPLE

Consider the following short biography text:

Anni Albers is American, and she is a textile designer, a draughtsman and a printmaker. She was born in Berlin on June 12, 1899. She studied art in 1916–1919 with Brandenburg. Also, she studied art at the Kunstgewerbeschule in Hamburg in 1919–1920 and the Bauhaus at Weimar and Dessau in 1922–1925 and 1925–1929. In 1933 she settled in the USA. In 1933–1949 she taught at Black Mountain College in North Carolina.

This is not a sophisticated text; indeed, it could be improved in many ways. Its relevance for us here is that it was generated fully automatically by an NLG system as one of several hundred similar texts on the basis of information acquired by a prototype information system in the area of art history.^[7] The biographical texts used here reflect the information that was held at some particular time within the experimental information system: there is no claim of historical or factual accuracy.

In order to produce the text, the generation process ran through the components of the NLG pipeline shown above. A macroplanning step produced a textual organization appropriate for a biography anchored to particular chunks of information from the system's knowledge base. This was then passed on to a general-purpose realizer containing a large-scale grammar of English. Clearly, if

this text were the only possible result from the system when considering the selected artist, then there is no particular win in employing NLG technology rather than some simple template methods, or even a human writer. Consider, however, the following text:

Anni Albers. American textile designer, draughtsman and printmaker. Born in Berlin June 12, 1899. 1916–1919 studied art with Brandenburg. 1919–1920 studied art at the Kunstgewerbeschule in Hamburg. 1922–1925 and 1925–1929 studied at the Bauhaus at Weimar and Dessau. Albers settled in the USA in 1933. 1933–1949 taught at Black Mountain College in North Carolina.

This text was also produced automatically by the same system, and what is more, it was produced from *the same set of data* using the same lexicon and grammar. It is different to the first text for the simple reason that its intended purpose is slightly different. In the latter text we are producing a biography sketch in note form; it might be more appropriate laid out as a table, or as additional information to a diagram or “info-graphic.” However the text is presented, its different function is appropriately accompanied by linguistic variation. Compared to the first text we see elements in different places, different connections between sentences, and so on.

Whereas the production of an alternative text in response to differing communicative goals and user requirements would represent a major overhead for a non-NLG-based text production system, this fine-grained matching of text and function is precisely what an NLG system undertakes to provide. The variations shown in this second text could be produced by some transformation of the first version, but it should be clear that making such a transformation work reliably for a wide range of artists with differing amounts and kinds of information held about them would be an endeavor requiring very careful attention.

When we change the intended function slightly again and go on to consider a further variant, we see another different set of “transformations” again:

Anni Albers, the American textile designer, draughtsman and printmaker who was born in Berlin on the 12 June 1899, taught at Black Mountain College in North Carolina from 1933 until 1949 after settling in the USA in 1933. Previously, she had studied art with Brandenburg in 1916–1919, at the Kunstgewerbeschule in Hamburg in 1919–1920 and at the Bauhaus at Weimar and Dessau in 1922–1925 and 1925–1929.

Any *one* of the three example texts could probably be constructed (although not particularly easily) with carefully handcrafted transformations of some “underlying” information, but this approach does not naturally lend itself to the creation of the alternatives. When variable text production is going to be an aim for some information

presentation system, for whatever reason, then it becomes appropriate to consider whether more sophisticated NLG techniques could be usefully employed. This is particularly relevant for current moves being investigated in the pursuit of message/text “personalization”; the requirement that text be produced flexibly is therefore by no means nowadays an unlikely situation.

The range of variation in these three examples illustrates a very small subset of the linguistic variations actually possible. This is a significant NLG issue in its own right because all such variations in linguistic phenomena need to be *orchestrated* so as to indicate the coherence and textual unity of the resulting product. In much NLG work, therefore, the point of interest is not what kind of variations are *possible*—large-scale generation systems will in any case be able to produce the grammatical variation exhibited here—but rather the question *when* and *why* any one variant is to be selected rather than another. Generation is fundamentally a matter of *choice* and of uncovering the reasons why one choice may be better than another in any particular context of use: this is the essential task of strategic generation and text planning.

NATURAL LANGUAGE GENERATION AND LINGUISTIC VARIATION

Above we described a generic architecture for an NLG system. We can also characterize NLG systems and their architectures from the perspective of *the range of language phenomena* that they handle. To do this requires more linguistic sophistication and so is not generally favoured within the NLG community itself. There characterizations in terms of the “standard” modules that we have seen are more common: tactical generation, microplanning, text planning, and so on. But considering the linguistic phenomena at issue provides an equally, if not more, insightful characterization because the phenomena are not shaped or restricted by architectural decisions within any particular NLG system.

To gain a theoretical hold of the linguistic phenomena and the alternatives that are relevant for building NLG systems, it is useful to employ the linguistic notion of *stratification*. Stratification refers to the differing kinds of information, at differing levels of abstraction, that contribute to the organization of any text. Thus, we can talk of lower levels of linguistic abstraction, such as phonology, morphology, syntax, or lexicogrammar (typically placed within the realiser component), and semantics and the higher levels of abstraction, such as those of text structure and style (the responsibility of macroplanning). Texts might then vary in their use of different text structures, of different syntactic structures, of different phonologies (when spoken), and so on. Regardless of an NLG component’s actual inputs and its context of application, we can identify generation tasks in relation to the level of

linguistic abstraction, or stratum, at which variation is being offered or controlled and consider appropriate computational mechanisms for their support.

A minimally necessary (but not sufficient) set of organizations capable of explaining how a text works—i.e., capable of explaining its “textuality”—consists of the two least abstract linguistic strata:

- Lexicogrammar: certain sequences of elements can be recognized as belonging to English (or some selected language) while others are not. The possible grammatical structures used in a language and the associated words that may (or may not) occur in them define a very constraining organization that must be adhered to in any text. Sentences are not arbitrary combinations of words.
- Semantics: in addition to knowing which structures and words are possible, there is also a clear organization that constrains the selection of knowledge in general to the particular kinds of knowledge necessary for linguistic expression. This varies across languages—for example, some languages require the textual status of definiteness to be expressed in the grammar (English) whereas some do not (Chinese, Russian).

The former area has been widely addressed within linguistics and can draw on a host of work on syntactic theory; the most commonly employed approaches for NLG include Combinatory Categorical Grammar (CCG), Head-Driven Phrase Structure Grammar (HPSG), Systemic-Functional Grammar (SFG), and Tree-Adjoining Grammar (TAG). For the latter area, a particularly useful orientation is to consider the consideration of the *semantic control* that a detailed lexicogrammar requires in order to make its selections. Early representations of such control information annotated structural rules or lexical units with “semantic” or “pragmatic” information as needed for particular effects.^[8] Now there are several more sophisticated accounts available that offer a broader range of controlling/constraining semantic information for motivating lexicogrammatical generation. Even though particular NLG systems will differ in the precise input form they adopt, *linguistic semantic* representations provide a good basis for considering alternatives independent of particular implementations.

The most obvious semantic area for controlling lexicogrammatical decisions—particularly from the perspectives of logic, natural language understanding, or applications of NLG—is the “propositional content” of individual sentences: the traditional “who did what to whom (when and how).” This can be used to guide the lexicogrammatical selection of basic units (such as, often, clause *vs.* noun phrase *vs.* adverbial, etc.) and the basic grammatical structures used within these categories (e.g., intransitive, transitive, or ditransitive clause structures). For example, a “logical” form “*study*! (*Albers*!, *art*!, *t_i*),”

that is intended to represent a predicate of studying that relates Anni Albers to the discipline art at some time *t_i*, might drive the lexicogrammar to select a clause with a transitive structure such as *Albers studies art*. A full representation of this aspect of a clause’s meaning would then require at least additional information concerning temporal relations (particularly with respect to the time of speaking in order to control grammatical tense decisions), logical scopes of various quantifiers, etc. Various representations are used for this kind of information, termed *ideational*, but nowadays these show considerable commonalities. In particular, most adopt a so-called Neo-Davidsonian semantics involving two essential features: first, “events” are considered proper objects in their own right and, second, the relations between participants and events are characterised by a small set of named relations.

An example is shown in Fig. 2, couched in the widely used “Sentence Plan Language” originally developed for representing inputs to the realizer of the Penman text generation system. This semantics again represents a logical form for a sentence involving Albers studying art. Semantic-based inputs allow a system to abstract away from particular sentences as they might need to appear in the concrete texts generated and so provide more support for variation. They even allow in many cases a generalization across different languages, so that parallel versions of the same text might be produced by employing different realizers or different grammars.^[9] Similar kinds of information are now provided in many modern semantics formalisms and can be expressed in description logics, minimal recursion semantics,^[10] hybrid dependency logic,^[11] and others. Within NLG, it is description logic (including its most recent manifestation in the Web Ontology Language, OWL) that is now the most common.

Much information necessary for controlling a realizer is, however, left unspecified in this representation. Missing information includes particular choices of words, grammatical selections such as active or passive, word orders, pronominalizations, tense, focusing constructions, etc. The constraints for selecting these are generally drawn from two further sources of control, termed *textual* and *interpersonal*, respectively.

Textual meaning is involved because NLG is concerned with producing coherent texts and not just isolated sentences. Almost all examples of texts actually generated

```
e1 / study
      : actor (x1 / female :name Anni-Albers)
      : actee (x2 / art)
      : temporal-locating (t1 / time :year 1916))
```

Fig. 2 Example skeleton semantics for: “Anni Albers studied art in 1916.” e1, x1 and x2 are logical variables; the terms following forward slashes are semantic types; terms introduced by colons are roles or properties.

to date (including our example texts above) have problems related to their expression of textual meaning—i.e., there are places where a human text producer would have made selections resulting in a more “fluent,” or natural, text. A central research problem in NLG is then to isolate and describe the sources of constraint for lexicogrammatical decisions that influence textuality: i.e., again, how to control a lexicogrammar. The richer the lexicogrammatical resources that are represented, the more complex the problem becomes. If a lexicogrammar offers few possibilities, then issues of control are reduced; but possibilities for fluency are then also reduced. Many current approaches to NLG therefore concentrate on finding appropriate control constraints for general resources rather than on relying on artificial restrictions on the resources themselves—either by extending the semantics to include suitable statements or by weighting the selections made in the grammar probabilistically according to the desired language style.^[12]

Purely probabilistic methods are problematic, however, in that textual organization can be employed strategically to improve text flow and is not simply a matter of style. Any reasonable lexicogrammatical resource of English will offer, e.g., in addition to the sentences that appeared in the example texts, sentences such as:

- e. With Brandenburg, she studied art in 1916–1919.
- f. In 1916–1919, Anni Albers studied art with Brandenburg.
- g. She studied art with Brandenburg in 1916–1919.
- h. The third artist shown above studied art with Brandenburg in 1916–1919.
- i. Moreover, she studied art in 1916–1919 with Brandenburg.
- j. It was in 1916–1919 that she studied art with Brandenburg.

Sentences (e)–(g) might be argued not to differ in propositional content, although they have different preferred contexts of use in texts; sentence (h) introduces semantic content to refer deictically to the artist in question, thereby bringing in issues of *referring expression* generation; sentence (i) makes its relation to the preceding text more explicit and so can also be taken as introducing more information; and sentence (j) has a similar function, but uses a particular grammatical structuring to realize that function.

Moreover, different linguistic units can include more or less of the content to be expressed. Some consequences of this for sentences appropriate to our Bauhaus texts are illustrated in the following examples:

She studied art with Brandenburg in 1916–1919, and at the Kunstgewerbeschule in Hamburg in 1919–1920, the Bauhaus in Weimar in 1922–1925 and the Bauhaus in Dessau in 1925–1929.

She studied art with Brandenburg. That was in 1916–1919.

Albers studied with Brandenburg in 1916–1919. She studied at the Kunstgewerbeschule in Hamburg in 1919–1920. She studied at the Bauhaus in 1922–1925. . . .

Anni Albers was a text designer, draftsman, and printmaker, who was born in Berlin on 12 June 1899.

Here, sentence (k) includes both the original sentence and further content closely related to that of the original, while sentence (l) divides the original content over two sentences and uses “discourse deixis” to bind the sentences together into a text fragment. Sentence (m) then goes to the extreme and separates out the events grouped together in (k), each studying period is realized in a separate sentence. Sentence (n) shows a similar decision, where the first two sentences of the example text have been combined into one.

The phenomenon at issue in all these sentences is termed *aggregation* in NLG; detailed rules and heuristics for controlling this grouping have been suggested as an important component of microplanning. A similar phenomenon applies at all linguistic levels: sentences (k)–(m) could also be expressed as (o), while the first sentence of the first example text above would read better as (p) and the similar variations found in the latter two example texts.

Anni Albers was an art student from 1916 to 1929.

Anni Albers is an American textile designer, draftsman and printmaker.

In (o) many events have been combined and covered in a single property attribution: *being an art student*; similarly in (p) the nationality and professions have been combined in a single complex property. The decisions for these presentational forms depend again on the particular granularity goals of the text being produced, which in turn depends on the situation and hearers/readers involved.

The second area of control, the *interpersonal* meaning, is important because any natural language utterance obviously does more than simply express an intended propositional content. Clauses also express the attitude of the speaker to the content being expressed. This is minimally necessary in order to motivate control of variation such as the following based on the sentence “She studied art in 1916–1919 with Brandenburg” from the example texts:

Did she study art with Brandenburg in 1916–1919?

She studied art with Brandenburg in 1916–1919, didn’t she?

Actually, she studied art with Brandenburg in 1916–1919.

Here, sentence (q) changes the speech function of the sentence to a query; sentence (r) changes the speech function to request support from the hearer; and sentence (s)

introduces more content, but here that information reflects the speaker's speech act force. In systems for spoken generation, there is also the further variation:

She studied art with Brandenburg in 1916–1919?

In (t), the sentence structure is as for an assertion, but the intonation selected indicates a question. There are several accounts of intonation used in generation and sources of control for lexicogrammars should then include provision for such variation. Interpersonal meanings can also have a decisive influence on other aspects of a text. For example, expressions of various speaker attitudes will partially determine the most appropriate words selected (“artist” vs. “charlatan”; “artwork” vs. “junk”). When generation systems have access to words varying in this way, they need to make sure that they do not select inappropriately. Interpersonal force is also important for the correct realization of requests, orders, statements, etc. and so can have substantial consequences for grammatical selections as well as word selections.

The appropriate control of a lexicogrammar therefore requires many additional constraints over and above the propositional content to be expressed. Providing such information enables broad coverage lexicogrammars to produce textually appropriate lexicogrammatical structures. This concerns the “how” to express what is to be expressed issue of NLG: i.e., tactical generation. We can say linguistically that any text reveals many “predispositions” of the speaker that pervasively influence both the information selected for expression and its form of expression. This consistency in selected semantic options is then a common issue across all three of the areas of meaning described here. Ideational, interpersonal, and textual selections all exhibit a unity that is characteristic of textuality. One abstract mechanism proposed to describe this is the systemic-functional notion of *register*. The theory of register states that language varies systematically according to its situation of use: consistency in situation therefore calls for consistency in the takeup of semantic options.^[13] Several systems now attempt to provide stylistic control, often employing probabilistic language models to select a particular slant from a broad range of “over-generated” possibilities.^[12]

TEXT PLANNING

The next—and many researchers in NLG would consider the main—task in NLG is to guarantee that *sequences* of such constraint specifications are produced in such a way that they are mutually consistent and together combine to create recognizable *text*. Thus, as always in NLG, it is not sufficient that a full NLG system offers the means for controlling lexicogrammars to produce textually varied constructions, such a system must also be able to select

from the theoretically available possibilities those that are most appropriate for the instantial text being produced. Texts are not arbitrary combinations of sentences.

Early attempts to organize texts relied on the intrinsic organization of the knowledge being expressed; i.e., the organization of the knowledge determined the structure of the texts produced. This cannot be guaranteed to give an understandable or suitable text for any particular communicative purpose and so is inappropriately rigid. To achieve more flexibility, NLG now commonly plans out text structure independently of the content to be expressed, appealing to notions of “discourse structure.” Currently the most commonly used approach here is *Rhetorical Structure Theory* (RST).^[14] RST provides a general description of the relations holding among segments of a text, whether or not they are grammatically or lexically signalled.

Descriptions of texts, or texts generated using RST, are decomposed hierarchically into a nested set of related text “spans.” RST defines approximately 25 relations which may hold between these spans, motivated originally on the basis of detailed descriptive linguistic analyses of some 400 texts of varying content and genres. An RST analysis of the Bauhaus biography text illustrating some of the relations defined is shown in Fig. 3. This analysis claims that the main point of the text (obtained by following the straight vertical lines downward from the top) is the fragment stating that Albers taught at Black Mountain College, thereby spreading the Bauhaus movement; other information is related to this as indicated by the identified rhetorical relations—i.e., background, circumstance, elaboration, and sequence. This particular rhetorical analysis brings out the fact that the text is intended to stand as an illustration of the spread of the Bauhaus movement to the United States and not as a neutral biography, which would typically consist of a simple sequence of events arranged chronologically.

RST definitions bring constraints to bear on the kinds of meanings that the related text spans must carry, and on the communicative effect achieved by the combined set of text spans. Constructing discourse structure in terms of RST relations has proved itself to be useful for supporting selections of linking forms and textual connectives, such as the “moreover” of sentence (d), or the deliberate *non*-selection of a conjunction: it is only because the discourse is being developed in a particular way that a particular form is appropriate. Once an NLG system has an RST-style text plan available, it has much of the additional information discussed above as necessary for motivating nonpropositional semantic choices. RST has also been used to constrain the recency relationship for anaphors, choices of theme, intonational phrasing, hyperlink generation, summarization options, and selections of focus. Several detailed overviews of the development of rhetorical relation-based NLG methods have been given,^[15] as well as introductory examples showing text planning using

Fig. 3 Example RST analysis of a Bauhaus biography text.

RST in action.^[16,17] Other commonly used approaches to text structuring are *text schemas* introduced to NLG by McKeown^[8] and, more recently, discourse grammars based on tree-adjoining grammars.^[18] All take on the task of selecting and structuring content to be expressed in a text flexibly responsive to communicative goals.

CONCLUSIONS: CURRENT DEVELOPMENTS AND OUTLOOK

The demand for natural language texts providing information of every conceivable kind is rocketing. Thus it is certain that NLG will form a key information technology in the future—there is scarcely an area of information presentation where beneficial applications of automatic text production cannot be imagined. Although it may still be some time before NLG techniques begin making a substantial impact on systems in everyday use, increased awareness of the potential will certainly be the most crucial aspect in hastening their adoption.

Several extensions to the field that have already occurred will contribute to this. Early on NLG moved away from considering text production in a single language to parallel generation in several languages.^[9] More recently, there has also been a move away from generating only texts to consider the automatic production of combinations of text, graphics, diagrams, and pictures.^[19,20] Moreover,

generation techniques are now increasingly being employed in the originally rather separate field of dialogue systems. As the dialogues expected of question–answer systems, information systems, robotic systems, avatar generation (involving speech, facial expression, and gesture), etc. become more sophisticated, it is natural to turn more to the tools of NLG. There is clearly very much more to learn here concerning how these modalities can be combined appropriately and a regular conference has now been started to present research in this area.^[21]

NLG systems are now beginning to appear on the World Wide Web, the pervasiveness of this new media giving fresh impetus to previously more academic explorations of automatic hypertext generation. Many aspects of NLG—including text planning, multimodal information presentation, and tactical (surface) generation are now combining in the construction of (possibly partially) synthetic hyperdocuments. This area is certain to be highly significant in increasing the acceptance and use of NLG technology, as well as in driving future NLG research. Until recently, the most significant technical bottleneck preventing the wider exploitation of NLG technology was the availability of sufficiently well-structured knowledge sources; clearly the closer we come to the Semantic Web, the easier it will be to employ NLG technology productively.

Partly as a move toward supporting applicability, the topics covered in international conferences relevant to

NLG over the past 5 years now include substantially more work on *evaluation methods* than was previously the case and there is ongoing discussion of how this can be furthered. Several “shared tasks” are being defined so that alternative approaches and systems can be compared. The most well accepted of these tasks so far is that of generating referring expressions, since this can be seen as a relatively modular component of the NLG task overall. The other topics now being addressed most include dialogue, stylistic control, and text planning in general.

FURTHER INFORMATION

Further information about natural language generation, ongoing work, and upcoming conferences, can be found on the Web site of the Association for Computational Linguistics (ACL) Special Interest Group on NLG (SIGGEN): <http://www.siggen.org>. There are two biannual conferences dedicated to NLG: the International Natural Language Generation Conference (running in even years) and the European Natural Language Generation Workshop (running in odd years). The proceedings of these conferences can be found in the ACL electronic paper archive.

Slightly more technical introductions to NLG can be found in several encyclopedias or handbooks,^[16,17,22,23] while Reiter and Dale^[3] have produced a textbook level introduction to the field. Finally, an almost complete list of natural language generation systems, with domains of application, references and theoretical foundations, is maintained in Bateman and Zock’s “B-to-Z of Natural Language Generation Systems” at <http://www.purl.org/net/nlg-list>.

Back-of-the-Book Indexing

Nancy C. Mulvany

Bayside Indexing Service, Fort Collins, Colorado, U.S.A.

Abstract

The book index occupies a special niche in the information retrieval world. Each index is a unique, authored work. Each book is a closed system. The text presented in a book does not change; the material is stable and fixed. Book indexers provide readers with a nonlinear way to access information in a text. Even though closed-system indexing predates the development of the printing press, a book index can be thought of as hypertext.

INTRODUCTION

We have all used book indexes. Generally they appear in nonfiction books in the back of the book. Most people do not realize that book indexes are written by people. They are not generated by computers. A table of contents presents some of the topics discussed in the book in a linear fashion, from the book's beginning to the end. The back-of-the-book index is an information map that systematically brings together access points to every important topic discussed in a book, including concepts and nuances developed by the book author.

Although the word index is used in many diverse contexts today—index of economic indicators, consumer price index, database indexing, and search engine indexing—a book index has a particular meaning and application. Susan Klement provides a useful framework for discussing indexing in “Open-system versus closed-system indexing: A vital distinction”^[1] when she writes:

Closed-system indexing assists people finding a unit or units of relevant information *within a document*, while open-system indexing is designed to facilitate the retrieval of one or more *documents* that contain relevant information.

Internet search engines are examples of open-system indexing. An index to a periodical such as *Forbes* is also an open-system index. The Internet grows every day; it also changes every day as Web pages are edited or removed. *Forbes* will continue to add new issues as long as the magazine is published. Open systems are in a state of flux.

A book is a closed system. There is a beginning, a middle, and an end. The book and its audience is a self-contained universe. Unlike an open-system index that casts a wide, but shallow net, a book index deeply presents a systematic guide to the information contained in a text in a manner that enables readers to quickly find specific topics or concepts.

It is the insular nature of a book index that sets it apart from many other information retrieval devices or finding aids. While there may be 20 books about Web page design, each will be unique. The books will likely cover similar topics, but the presentation and writing styles of the authors will be different. The indexes for these books will also be unique. The indexes will reflect not only specific topics covered in the text, but also conceptual relationships that are presented in unique ways by each author.

Book indexing has a long history that will be reviewed briefly. It is important to recognize that a book index is not simply an alphabetic list of words that appear in the text. There are several critical elements that appear in book indexes that we do not find in computer-generated word lists. These elements and presentation formats for indexes will be discussed along with publishers' style guides and international standards. Although it is difficult to generalize about the way indexes are prepared, the basic mechanics of indexing will be presented. Lastly, indexing specialization, training, and professional associations are discussed.

A BRIEF HISTORY OF BOOK INDEXING

Closed-system indexing has a long history. It is natural to assume that the book index did not appear until books were printed. However, if we think of this particular information retrieval device as a closed-system index it is apparent that the need for an index of this type emerged before bound, printed books were produced. Hans Wellisch^[2] writes:

Indexing of books did not begin, as is commonly thought, after the invention of printing. It started with the rise of universities in the 13th century. Although no two manuscripts of the same work were exactly alike and folio or page numbers were seldom used, indexes to theological treatises, lives of the saints, medical and legal compendia

and, most of all, to collections of sermons were compiled, using chapter and entry numbers instead of pagination.

Bella Hass Weinberg^[3] has dated a Hebrew manuscript citation index back to the twelfth century. Hazel K. Bell in *From Flock Beds to Professionalism: A History of Indexer-Makers*^[4] suggests that “perhaps the first known indexer is Ptolemy, who produced an index to his first world atlas c. A. D. 150.”

When documents that could not be easily browsed were produced, there was a need for a finding aid. The development of the printing press made possible the mass production of bound books. Pagination of the books made possible the compilation of book indexes for each title. These indexes are referred to as “back-of-the-book indexes” because they usually appeared in the back of books. Today we are witnessing the transition of books from printed pages to electronic media. Although the media for book presentation may be changing, it is still useful to remember that need for a book index has not changed. Closed-system indexing exists independent of presentation media.

WHAT IS AN INDEX?

In the United States, the National Information Standards Organization (NISO)^[5] defines an index as “a systematic guide designed to indicate topics or features of documents in order to facilitate retrieval of documents or parts of documents” (p. 39).

The International Organization of Standardization’s (ISO) *ISO 999*^[6] defines an index as an

alphabetically or otherwise ordered arrangement of entries, different from the order of the document or collection indexed, designed to enable users to locate information in a document or specific documents in a collection.

(Entry 3.5)

Many find these definitions too broad and imprecise. More thorough and lengthy descriptions of the purpose of an index can be found in the *British Standard*’s “Function of an Index”^[7] and the American Society for Indexing’s (ASI) “Criteria for the H.W. Wilson Award.”^[8]

For general purposes, I find this definition useful: “An index is a structured sequence—resulting from a thorough and complete analysis of text—of synthesized access points to all the information contained in the text.”^[9]

A computer-generated list of words in the text, even arranged alphabetically, is not an index. For example, a concordance does not require analysis and synthesis of a text and its meaning. The concordance can only list words that appear in the text; it cannot include concepts or indicate relationships between topics. An alphabetical list of

words does not truly qualify as the structured sequence that we associate with a proper book index.

ELEMENTS OF AN INDEX

A book index includes several major components: headings, locators, cross-references, and an arrangement scheme. Headings are composed of terms that readers are likely to look up. Locators indicate where in the text the heading can be found. Often locators are page numbers. Cross-references are linking devices that provide navigation guidance for synonyms or other related terms within the index itself. The arrangement of entries in an index is usually alphabetical. Here is an example:

nutrition, 34–40
adults, 125–130
children, 67–73
infants, 53–59
See also supplements

Headings

In the example above “nutrition” is the main heading and “adults, children, infants” are subheadings. Often headings are terms that appear verbatim in the text. For example, “Art Trading Fund, 22,” will be found on page 22. Some types of entries are inverted in indexes. A common example of an inverted heading is a personal name: “Lakoff, George, 12.” The nutrition example above is a conceptual heading. The word “nutrition” may or may not appear on the pages referenced. However, the indexer has determined that nutrition is discussed on these pages and has provided access to the discussion.

Locators

Each heading is followed by a locator. In the example above the locators are page numbers in a book. Locators must be precise and accurate. In some books, such as dense legal texts, a page number lacks precision. Instead, the locator may take the form of chapter number and paragraph number, such as “reserve against returns, 12.34(a).” Additionally, locators must be helpful. A main heading followed by a string of 30 separate locators is not helpful. Instead, subheadings should be provided that help guide the reader to specific information about the main heading.

Cross-References

The last line in the nutrition example is a *See also* cross-reference that directs readers to another closely related heading, in this case the “supplements” heading. Another type of cross-reference, the *See* cross-reference, performs a vocabulary control function. For example, “food. *See*

nutrition,” tells readers that information about food will be found at the “nutrition” heading.

The main heading and the entire block of information that follows it is referred to as an entry or entry array. The “nutrition entry” is composed of the main heading, subheadings, locators, and the cross-reference.

Arrangement of Entries

Lastly, a major element of any index is the systematic arrangement of entries. Book indexes are usually arranged in alphabetic order. There are two basic forms of alphabetic orders, word-by-word and letter-by-letter. To further complicate matters, many index entries include elements that are not letters of the alphabet:

Lakoff, George
San Francisco
!ls command
War of 1812

All four terms contain spaces. The first and third terms include punctuation marks and the last term contains a number. Any arrangement scheme must take all elements of an index entry into consideration. *NISO TR03: Guidelines for Alphabetical Arrangement of Letters and Sorting of Numerals and Other Symbols*^[10] provides the most cogent discussion of alphabetical arrangement. Briefly, *NISO TR03* presents the following rules for the order of characters:

1. Space that precedes any other character (hyphen, dash, and slash are treated as a space).
2. Punctuation marks are ignored.
3. Symbols other than numerals, letters, and punctuation marks precede numerals and letters.
4. Numerals precede letters.
5. Letters follow numerals.

Word-by-word alphabetizing

If the rules above are followed, the resulting arrangement order is called word-by-word.

type font
type foundry
Type/Specs Inc.
Type4You Inc.
typeface
typeset

Letter-by-letter alphabetizing

The letter-by-letter form of alphabetizing eliminates *NISO TR03*'s first rule, the space character (including hyphens, dashes, and slashes) is ignored.

Type4You Inc.
typeface
type font
type foundry
typeset
Type/Spec Inc.

These two styles of alphabetizing yield very different results, particularly in long indexes. Most users of book indexes do not think about various ways to alphabetize entries. They expect an entry to be in a particular place. If they do not find the entry, they may assume that the topic is not discussed. Choosing an arrangement order that works for users is critical. Unfortunately, as James Anderson^[5] points out, there is a lack of agreement regarding arrangement:

Two de facto standards widely used in libraries and databases in the United States are the American Library Association (ALA) and the Library of Congress (LC) filing rules. The guidelines for alphanumeric arrangement in *The Chicago Manual of Style* are used as a de facto standard by many publishers. These three codes of alphanumeric arrangement are, however, incompatible with each other (Entry 9.1).

Many book publishers follow their own alphabetizing styles. North American publishers often follow the guidelines in *The Chicago Manual of Style*, published by the University of Chicago Press, which calls for letter-by-letter alphabetization. It is important to note that Chicago's form of letter-by-letter alphabetization does not strictly follow the recommendations of *NISO TR03* discussed earlier. Style guides will be discussed in more detail later.

PRESENTATION FORMATS FOR INDEXES

There are two basic presentation formats of indexes: indented style and run-in style. Before discussing these formats it is important to keep in mind that the layout of an index is directly related to its usability.

The main goal of an index is to provide quick and easy access to information contained in the text. Unlike other types of text, indexes are not read in a linear fashion from beginning to end. Instead, readers jump into the index at various points. They scan for particular entries. The design of an index should enhance scanning by readers. They should be able to quickly determine at any place where they are in the index. Indexes that are dense and cluttered will frustrate users. The ideal index is almost transparent. Readers turn to the index, quickly find the desired entry, and locate the information in the text of the book. They are in and out of the index very quickly.

The indented and run-in formats for indexes are distinguished by the way subheadings are formatted. The indented style begins each subheading on a separate line,

indented under the main heading. The run-in style separates subheadings with a semicolon and runs them all together as one block of text indented under the main heading. Here are some examples:

Indented style:

nutrition, 34–40
adults, 125–130
Asian perspective on, 200–202
children, 67–73
European perspective on, 210–212
infants, 53–59
See also supplements

Run-in style:

nutrition, 34–40
adults, 125–130; Asian perspective on, 200–202;
children, 67–73; European perspective on,
210–212; infants, 53–59. *See also* supplements

Above, the indented format uses seven lines, whereas the run-in style uses only four lines. Saving space is the main reason some publishers prefer run-in format. However, the indented format is easier to scan and use. In a complex index that includes sub-subheadings a run-in format cannot easily accommodate the extra level of detail. There are times when a hybrid style can be used with good effect. The indexes in the 15th edition of *The Chicago Manual of Style* and the 2nd edition of *Indexing Books* use a combination of the two styles. Subheadings are presented in indented format while sub-subheadings are run-in. There are many more issues related to the presentation format of indexes. For a more detailed discussion see “Format and Layout of the Index” (pp. 191–217) in *Indexing Books*.^[11]

STYLE GUIDES

As mentioned earlier, most North American publishers follow the indexing style requirements of the University of Chicago Press, in particular Chapter 18 “Indexes” in *The Chicago Manual of Style*.^[12] The chapter about indexes is published as a separate booklet that is often given to authors preparing their own indexes.

Some publishers use a modified form of “Chicago style” or devise their own indexing style guide that meets their unique needs. At minimum an indexing style guide will include rules for five elements:

1. Alphabetizing of main headings.
2. Arrangement of subheadings.
3. Format of entries.
4. Format of reference locators.
5. Format and placement of cross-references.

Of course, there are many other elements included in publishers’ style guides. For example, a scholarly publisher

will provide rules for the indexing of endnotes or footnotes. A technical publisher will have guidelines for the arrangement of numbers and symbols in index entries.

In the United Kingdom, *The Oxford Guide to Style*^[13] includes a detailed discussion of the index style requirements for Oxford University Press.

STANDARDS

Currently the United States does not have a standard for the presentation of indexes. The NISO makes available a technical report, *Guidelines for Indexes and Related Information Retrieval Devices*^[5] that did not garner enough votes to become a standard.

The ISO released *ISO 999: Information and Documentation; Guidelines for the Content, Organization, and Presentation of Indexes* in 1996.^[6]

MECHANICS OF INDEXING

Generally book indexing does not begin until the pagination for a book is complete. Most book publishers send the indexer a set of printed, paginated pages. The pages are not bound and there is printing only on one side of the paper. Some publishers send indexers electronic copies of the book, usually as a PDF file.

One question indexers are often asked is “Do you have to read the entire book?” Yes, the indexer reads the entire book! Some indexers scan through all the book pages and mark possible index entries on each page. Others skim the table of contents and then start indexing.

Professional indexers use specialized indexing software. The programs can be set up to produce an index that conforms to the publisher’s style. Index entries are typed into the program along with their locators. The software handles the alphabetizing along with many other tasks. For example, professional indexing software will perform cross-reference checking: if a cross-reference is created for an index entry that does not exist, the indexer will be warned. The three major indexing programs are Macrex (<http://www.macrex.com/>), SKY Index (<http://www.sky-software.com/>), and CINDEXT (<http://www.indexres.com/>).

In the United States most publishers’ book contracts stipulate that the book author must provide the index. Since professional software is costly, currently around \$500.00, many book authors prepare indexes using their word processors. Some authors still use index cards to compile the entries. A more detailed discussion of manual methods of indexing can be found in *Indexing Books*.^[14]

Regardless of the tools used to compile an index, going through the text and creating index entries is only the first step. The index must be edited and checked for accuracy. Some indexers set aside 25% of their time for editing

tasks. Of course, the actual proportion of indexing time devoted to editing will vary from book to book. More time may be needed for a lengthy (500+ pages) book than for a shorter one.

Often book authors are shocked to discover that their editor expects the index to be delivered in a short span of time. Often 2 weeks is the time budgeted for indexing a 300-page book. The indexing process is demanding. Even professional indexers find it difficult to index for much more than 6 hours a day. Book authors, many without any experience or training in indexing, are often overwhelmed.

The most difficult aspect of indexing is term selection. Indexers must decide not only which terms go in the index, but also the form of the term. Some terms are obvious. For example, a book about California geography will surely include index entries for various mountain ranges such as the Sierra Nevada, Siskiyou, and Santa Lucia mountains. Unfortunately not all term selection is so straightforward. Often authors use synonymous words to describe the same topic. The indexer must make vocabulary control decisions and choose one term for the index entry and provide a *See* cross-reference from the term that is not used. If the author uses both “autos” and “cars,” the indexer may decide to use “cars” as the index entry and add a cross-reference (autos. *See* cars).

As the indexer works through the text an intricate mapping structure begins to emerge. Many indexers find themselves returning to index entries written earlier and tweaking them so that they fit better into the overall index. The ability to keep the entire index structure in one’s mind while working is critical. An index must always treat similar concepts and terms in a consistent manner. Users of indexes depend on this consistency to locate desired information. Using the autos/cars example, it is a disservice to readers to scatter information between two entries, as in:

autos, 23, 44–45
cars, 23, 56–58, 60

Readers looking at only one of the entries above will not get all the reference locators. They should not need to look in two places in the index. The more consistency the indexer can add to the index structure while writing the index, the less editing will be required after the initial term selection is complete.

The preferred vocabulary for an index is always the author’s vocabulary. The indexer is not free to impose an external vocabulary on an index. But while indexers must remain true to the author’s language, they must also anticipate the vocabulary needs of the readers. This often requires reconciling the readers’ external vocabulary with that of the book through the use of cross-references. Take the example of a book about British dog shows that will be distributed in the United States. An American reader might not know that the “herding group” is called the “pastoral group” in the United Kingdom. The astute

indexer will provide a cross-reference: “herding group. *See* pastoral group.”

As the indexer works, the index itself is massaged into a form that will provide quick and complete access to the information contained in the book. If the indexer does a good job, the index structure will be transparent to users. Readers will not think about index structure. Rather, they will quickly locate their desired information and return to the text. Such a transparent and functional information access structure does not emerge on its own. It is the result of deliberative work.

SPECIALTIES

Many indexers are generalists. They can comfortably index on a wide variety of topics. Most nonfiction books that are mass distributed to the general public can be indexed by any competent indexer. However, there are many books that require special skills due to either the genre of book or the subject of the book.

Genre Specialties

Cookbooks and biographies are books that have unique indexing requirements. Cookbook indexes, when done well, are extremely detailed. While not every ingredient in a recipe is indexed, the main ingredients are often indexed along with the recipe name and type. In a barbecue cookbook, “Jimmy’s Down Home Sauce,” would likely be indexed by its name. Since it appeared in the “pork” entry of the book, it would also be indexed under “pork sauces.” Likely, there is also entry under “sauces,” and the type of sauce that it is, “St. Louis style,” “North Carolina style,” or “Memphis style” to name a few. It may also appear under “tomato-based sauces.” Jimmy’s secret ingredient may be bourbon, so it could also appear under “bourbon.”

“Jimmy’s Down Home Sauce” is just one recipe. Many cookbooks have more than one recipe per page, so the density of indexing per page can be quite high. Some cookbook indexers specialize within the genre. Some indexers may feel very comfortable with dessert and bread baking books, but they may not feel confident about indexing an Indian cookbook. More information about cookbook indexing can be found at the Culinary Indexing Special Interest Group of the American Society for Indexing (<http://www.culinaryindexing.org/>).

Biographies, autobiographies, and letters pose their own set of indexing issues. How does one handle the indexing of the main character? How does one arrange the subheadings: alphabetic or chronological order? What if the subject led a colorful life? How does one index scandals? Hazel K. Bell has written extensively about this type of indexing. The 3rd edition of Bell’s *Indexing Biographies and Other Stories of Human Lives* is an excellent

reference.^[15] In this book she also briefly discusses the indexing of fiction, yet another genre specialty. Bell writes:^[15]

Although by no means standard practice, the indexing of fiction has been undertaken from time to time. Serious novels may be indexed in the same way as biographies or histories, as narratives concerning groups of people and the events in their lives.

It should be noted that Bell has written many fiction indexes, including indexes for five novels of A.S. Byatt.

Subject Specialties

Some books, because of the subject matter, require that the index be prepared by a specialist. Some indexers specialize in medical or legal indexing. Even within these two groups there are subspecialties. One medical indexer may easily work with a 600-page textbook on renal disease, while not feeling comfortable with a radiology textbook. Indexers who specialize in a particular subject area often have advanced degrees in the subject and keep in touch with the current terminology and advances in the field. Such intimate subject knowledge is needed when writing complex indexes for a technical book. The indexer must be fluent with the terminology so that appropriate cross-references can be provided and scattering information among synonymous terms can be avoided.

TRAINING

In the past many book indexers were self-taught. Formal coursework in book indexing is rarely offered in curricula of graduate schools of library and information science. Courses in “indexing and abstracting” are offered by some schools. However, it is often the case that the “indexing” part of the course does not cover book indexing in depth.

With only a few notable exceptions, most training courses are unaccredited. Some are offered through professional associations, while others are offered through continuing/adult education programs of colleges and universities. The ASI maintains a list of courses and workshops at <http://www.asindexing.org/site/courses.shtml>.

It is natural to wonder if training in indexing is necessary. But given the number of poorly written book indexes it is obvious that people are not born with an innate ability to index! There are two main benefits of book indexing coursework: students find out if they like the nature of indexing work and if they are able to do it well. Liking the work and doing it well are prerequisites for a successful career in book indexing. Since most book indexers work in a freelance capacity, it is also necessary that prospective indexers enjoy running their own small business. Some courses lightly cover the business aspects of book indexing.

Authors who must index their own books are often referred by their publishers to *The Chicago Manual of Style*. Unfortunately many writers find the discussion of indexing in *The Chicago Manual of Style* difficult. Another option is to contact the ASI and find a professional indexer.

PROFESSIONAL ASSOCIATIONS

Founded in 1957, the Society of Indexers (SI) in England is the original professional association for indexers. Over the years other indexing societies have affiliated with SI. Since 1958, SI has published *The Indexer: The International Journal of Indexing* (<http://www.theindexer.org/>). Below, the affiliated and nonaffiliated societies are listed in alphabetic order along with the current URL for their Web sites. Many of the Web sites provide a great amount of supplemental information about indexing.

SUMMARY

A back-of-the-book index is a human-authored text that provides a structured sequence of access points to the information contained in the book. A book, whether it is printed on paper and bound, or presented as pixels on a screen, is a closed system. The closed-system index is not constrained by information that may or may not be added in the future. Instead, the closed-system index focuses on a contained universe of information that is static. The very nature of the book, a human-authored text, demands a hand-crafted, human-authored index that is unique to each book.

Bibliographic Control [ELIS Classic]

Robert L. Maxwell

Special Collections and Metadata Catalog Department, Brigham Young University, Provo, Utah, U.S.A.

Abstract

Bibliographic control is the process of creation, exchange, preservation, and use of data about information resources. Formal bibliographic control has been practiced for millennia, but modern techniques began to be developed and implemented in the nineteenth and twentieth centuries. A series of cataloging codes characterized this period. These codes governed the creation of library catalogs, first in book form, then on cards, and finally in electronic formats, including Machine-Readable Cataloging (MARC). The period was also characterized by the rise of shared cataloging programs, allowing the development of resource-saving copy cataloging procedures. Such programs were assisted by the development of cataloging networks such as OCLC and RLG. The twentieth century saw progress in the theory of bibliographic control, including the 1961 Paris Principles, culminating with the early twenty-first century Statement of International Cataloguing Principles and IFLA's *Functional Requirements for Bibliographic Records* (FRBR). Toward the end of the period bibliographic control began to be applied to newly invented electronic media, as "metadata." Trends point toward continued development of collaborative and international approaches to bibliographic control.

Bibliographic control is the process of creation, exchange, preservation, and use of data about information resources. These resources may be of any type: ink on paper (e.g., books, scores, maps); recordings (e.g., music, spoken word); visual media such as photographs, films, paintings; three-dimensional objects such as sculptures or coins; electronic media, including digital reproductions of any of the previously mentioned media and original digital productions; and any other medium in existence or not yet invented, covering the whole array of intellectual creation. Such resources appear in various publication patterns—monograph, serial, or hybrids (currently known as integrating resources), and may be published or unpublished. Techniques of bibliographic control may also be extended to resources that are not the product of intellectual creation such as inanimate objects (rock specimens, chemicals), living creatures (plants and animals), or created objects that are not traditionally thought of as being subject to bibliographic control, such as clothing, buildings, or food products, indeed anything that an individual or institution might want to collect or keep track of.

Individuals and institutions wish to control these resources for a number of reasons. Collectors may want to ensure that they do not collect more than one copy of a given resource, or they may wish to learn of resources within the scope of their collection that they do not yet have. Institutions such as libraries have an interest in helping their users find materials already within their collection or that they may have access to. Publishers need to know who their authors are and at what stage their projects are, and when resources are completed they need to keep

track of their availability for sale. Retailers need to know whether a resource is available in their own inventory and at what price, or whether they can order a copy for a customer. Libraries and collectors may need to keep track of treatment needed periodically in their collections (such as conservation of deteriorating books, or "refreshing" digital collections as new platforms and systems arise). Tools created during the process of bibliographic control are necessary to fulfill all of these purposes.

There are many ways to control such resources. Many individuals practice a form of bibliographic control in their home library by a simple shelf arrangement method, perhaps grouping books by genre or author, or arranging their CD collection by composer. This allows them to easily find a wanted resource, or to verify that they already own (or do not own) a copy. This type of bibliographic control requires no record-keeping at all, except in the sense that the collection itself is the record. However, as their collection grows, individuals may begin keeping inventory lists, especially if the collection is too large to scan visually or if they intend to dispose of the collection in some way and want to record what they had.

The earliest libraries and archives appear to have used shelf arrangement systems to control their holdings. Scrolls or tablets may have been arranged on shelves in a fixed order logical to the creator of the archives, with the objects positioned so that a label or text was visible. A description of early Greek (Minoan-Mycenaean) filing systems is found in Staikos.^[1] Once collections got beyond room size, however, shelving arrangement was not enough, so lists and catalogs were created. For a useful

summary of early catalogs, see Carpenter.^[2] The most famous of these is *The Pinakes* of Callimachus, one of the keepers of the Library of Alexandria, a collection that numbered in the hundreds of thousands. Konrad Vössing estimates that the library contained 500,000 scrolls during the third century B.C.^[3] Ancient estimates went as high as 700,000. Callimachus's 120-volume work was a bibliography of all of Greek literature, based on the holdings of the Library, of which it was in effect a catalog. It was arranged by broad subject, and identified individual resources in the library by citing the first line of each work and the number of its lines. The combination of first line of a scroll with its number of lines was an important identification device in early manuscripts, since they often lacked titles.^[4] It is unknown whether *The Pinakes*, which have not survived, had directional aids such as location listings, but the work presumably had some use as a finding aid and possibly for inventory control.

Inventory lists such as that of Callimachus seem to have been the rule through the Middle Ages. These lists often followed the pattern of *Pinakes* in dividing collections into broad categories, frequently subdivided by size (folio, quarto, octavo). As these lists grew in size they took the form of books. Among the earliest of these book catalogs were the seventeenth century catalogs of the Bodleian Library, some of which were arranged alphabetically.^[5]

The idea that the construction of tools for bibliographic control should follow explicitly formulated rules did not really take hold until the mid-nineteenth century. Antonio Panizzi's famous (and at the time controversial) 91 rules for the compilation of the British Museum's catalog was one of the first such attempts. These rules were printed before the text of the catalog itself, so that users of the catalog could understand its arrangement and manner of construction.^[6] Other single-author codes followed, notably those of Jewett^[7] and Cutter.^[8]

These and other codes were followed (or not) based on their merits, but before the end of the nineteenth century no particular need was felt for agreement between libraries on cataloging standards. As long as a library's catalog was consistent within itself, for purposes of bibliographic control it mattered little if its compilers followed different rules from those of other libraries. However, a new development caused a hasty move toward agreement on standards: the invention of the card catalog and the availability of catalog cards for sale.

Until the mid-nineteenth century catalogs were created in book form. This caused obvious problems when libraries expanded: in a growing library, the day after the book catalog came off the press it was already out of date. Blank sheets could be interleaved within a book catalog for manuscript additions, but eventually these filled up and a new edition had to be published at great expense. Indeed, the impetus for Panizzi's formulation of his 91 rules was the need to publish a new edition of the British Museum's book catalog. An ingenious solution to this problem was

the invention of the card catalog. New cards, each containing bibliographic data for a single resource, could be interfiled with the old, allowing the catalog to expand indefinitely without the need for new editions or republication.

The publication of book catalogs did not stop after the adoption of card catalogs, because they had one great advantage over card catalogs. In most cases the card catalog existed in a single instance only, usually a prominent feature of the library's reference room. Book catalogs were published in multiple copies, in some cases until the end of the twentieth century, and those of prominent libraries such as the Library of Congress, the British Museum, the Bibliothèque Nationale, or the New York Public Library were purchased by institutions around the world. Knowledge of the holdings of libraries other than one's own is clearly important to bibliographic control, allowing collectors to learn of resources outside their own institutions and allowing institutions to borrow from one another.

Such needs prompted the publication of printed union catalogs, the most prominent of which was the National Union Catalog (NUC), a compilation that attempted to include a reproduction of a catalog card for every book held in the major libraries of the United States and Canada, together with a list of all libraries that held each book. The main set, which included printed works published before 1956, ran to 754 folio-sized volumes (published 1968–1981), and was followed by several supplements. This enormous work is still not entirely superseded even in an age of massive bibliographic databases. A recent study discovered that more than 25% of the works represented in the NUC had not yet been recorded in OCLC.^[9] The figure has undoubtedly shrunk somewhat since the publication of Beall and Kafadar^[9] because of the merger of the RLIN database with OCLC.

A logical extension of the invention of the card catalog was the concept of sharing cataloging. If new cards created by a library's catalogers could easily be added to its catalog, so too could they be copied and added to another library's catalog. In 1898 the Library of Congress began to print its catalog cards, and began offering them for sale to other libraries in 1901. Purchasing ready-made catalog cards rather than creating them from scratch for some of the books in a library clearly made economic sense, but in order to be usable these cards had to be compatible with cards already in the library's catalog. This was particularly important in the matter of headings—resources in alphabetic (or “dictionary”) card catalogs needed to group together under authors, titles, and subjects, but if different standards were followed to work out these headings, chaos could result. To a lesser extent standards of description needed to be compatible between cards as well, if for no other reason than to avoid confusing catalog users. So in order to benefit from the economic advantages of shared cataloging, shared standards needed to be agreed on.

So it is not entirely coincidental that the first of these shared codes appeared within a decade of the start of LC's card program, in 1908. As a beginning of standardization within the English-speaking world, the American Library Association and the (British) Library Association attempted to work out a set of mutually agreed-upon rules. This was unsuccessful, and two editions of the code were published.^[10] Nevertheless, agreement between libraries within a single nation was a significant step forward, and the two codes were similar. It is probably also significant that these codes dealt primarily with the formation of entries. As already noted, agreement on the form of headings is probably more important in a shared environment than agreement on descriptive conventions. Indeed, it was not until the publication of the first edition of the *Anglo-American Cataloging Rules* (AACR) that rules for entry and description appeared together for the English-speaking library community within a single code.^[11] As with the 1908 rules, AACR1 unfortunately was published in two editions.

AACR followed an important international agreement concluded in 1961 by the International Federation of Library Associations and Institutions (IFLA). Known as the Paris Principles, the agreement has become the foundation of subsequent standards-making work in the cataloging world. The definitive text of the Paris Principles is International Conference on Cataloguing Principles, Paris, 1961, *Statement of Principles*, annotated edition with commentary and examples by Eva Verona (London: IFLA Committee on Cataloguing, 1971). The principles began with a statement of the function of the catalog, which is also a good summary of some of the principal purposes of bibliographic control:

2. Functions of the Catalog
The catalog should be an efficient instrument for ascertaining
- 2.1 whether the library contains a particular book specified by
 - a. its author or title, *or*
 - b. if the author is not named in the book, its title alone, *or*
 - c. if the author and title are inappropriate or insufficient for identification, a suitable substitute for the title; *and*
- 2.2
 - a. which works by a particular author *and*
 - b. which editions of a particular work are in the library.

The Principles established the importance of such basic concepts as uniform headings, personal and corporate authorship, and the function of main and added entries.

At the turn of the millennium the international cataloging community has created a new document intended as an updated version of the Paris Principles. The Statement of International Cataloguing Principles was developed by the IFLA Meeting of Experts on an International Cataloguing

Code during five annual meetings held in Frankfurt, Germany (2003), Buenos Aires, Argentina (2004), Cairo, Egypt (2005), Seoul, Korea (2006), and Pretoria, South Africa (2007). The final text is available in several languages at <http://www.ifla.org/en/publications/statement-of-international-cataloguing-principles>. It is expected that this document will become the basis for future cataloging codes throughout the world.

The Statement recites a number of objectives for the catalog, basic principles of bibliographic control that have become current in the years since the Paris Principles were promulgated. These are

- *Convenience of the user* of the catalog: cataloging decisions should be made with the user in mind.
- *Common usage*: standardized vocabularies should reflect the vocabulary the majority of catalog users would expect.
- *Representation*: descriptions and controlled forms of names should be based on the way entities describe themselves.
- *Accuracy*: the description should be faithful to the entity described.
- *Sufficiency and necessity*: only those elements that are essential to uniquely identify an entity should be included.
- *Significance*: elements should be bibliographically significant.
- *Economy*: bibliographic control should be achieved by the simplest or least costly method.
- *Consistency and standardization*: descriptions and access points should be standardized as far as possible in the interest of consistency and sharing of records.
- *Integration*: description of and access to all types of materials should be based on a common set of rules as much as possible.
- The rules in a cataloging code should be *defensible* and *not arbitrary*.

The formulation of the Paris Principles and the first edition of AACR in the 1960s coincided almost exactly with another significant development for bibliographic control, the use of computers as an aid to cataloging. The Machine-Readable Cataloging (MARC) standards were first developed at the Library of Congress in the mid-1960s under the leadership of Henriette Avram. A readable introduction to the MARC format in the United States is *Understanding MARC Bibliographic: Machine-Readable Cataloging*, 7th ed.; Library of Congress: Washington, DC, 2003, also available at <http://www.loc.gov/marc/umb/>. There remain numerous national MARC standards but the English-speaking world generally conforms to a standard currently called MARC21. First intended as an automated method for printing catalog cards, MARC's potential for exchange, retrieval, and display of records soon became evident, and MARC became the foundation

of electronic catalog databases. Just as significantly for bibliographic control, the MARC format allowed the creation of electronic union catalog databases (such as Research Libraries Information Network [RLIN] and OCLC, discussed below), which combined the advantages of card catalogs (easy extensibility and revisability) and printed book catalogs (access beyond the premises of the library) and eventually led to the near demise of both.

Another important bibliographic control standard, the International Standard Book Number (ISBN), was initiated in 1968 in Great Britain as the “Standard Book Number,” a nine-digit number assigned to individual editions of a publisher’s output. Within the same year the concept was extended worldwide to become the ISBN, the number expanding to 10 digits. In 2007 the number expanded again, to 13 digits. Since 1970 the ISBN system has been overseen by the International ISBN Agency in Berlin. Blocks of numbers are assigned to publishers by national agencies within the 166 member countries. The website of the International ISBN Agency is <http://www.isbn-international.org/>.

ISBN as an identifier of a discrete edition of a book is of obvious significance to bibliographic control, and the concept quickly expanded to other formats. There are now standard numbers for serials (ISSN) (administered by the ISSN International Centre, <http://www.issn.org/>), music (ISMN) (administered by the International ISMN Agency, <http://www.ismn-international.org/>), audiovisual materials (ISAN) (administered by the ISAN International Agency, <http://www.isan.org/>), recordings (ISRC, International Standard Recording Code) (administered by the International Federation of the Phonographic Industry (IFPI), http://www.ifpi.org/content/section_resources/isrc.html), and others. Any of these can be recorded within the MARC record for the appropriate resource as an identifier, a link, or finding device.

The ability to create electronic catalog records using the MARC format was as significant a leap forward for sharing cataloging as the Library of Congress’s sale of its printed cards, and it allowed a much wider community of cataloging participants. Although LC was not the only library producing such cards, an institution had to be relatively large and respected in order to afford to publish, and to expect a market for, its catalog cards. On the other hand, the only thing any library needed under the MARC regime to produce catalog records of potential worth to other libraries was a computer system capable of deploying MARC and a way to distribute the records. Further, before the advent of MARC it was cumbersome, if not impossible, to revise cataloging a library might receive on cards, e. g., to note local characteristics (such as inscriptions, unique bindings, or defects in the library’s copy). In an electronic environment it was not a difficult matter to enhance “copy” (the electronic catalog record a library might receive from another cataloging agency) not only for local characteristics, but also to enhance and correct the records for other

reasons. In a shared cataloging environment this benefited all who came after (and who, themselves, could continue to enhance a given record).

At about the same time as these developments the Library of Congress initiated a new program to enhance the ability of libraries in the United States and elsewhere to perform bibliographic control, the Cataloging in Publication (CIP) program. LC had conducted an experiment called “cataloging in source” in 1958 and 1959 under which its staff cataloged approximately 1000 books prior to their publication from page proofs so that cataloging information could be printed on the verso of title pages. Although the experiment showed that this could be done successfully, the Library ultimately dropped the project, feeling that the disadvantages outweighed the benefits, both to itself and to the publishers. However, the concept was revived in 1971 with the establishment of the CIP program. A good account of the beginnings of the program is found in Clapp.^[12] The program’s current home page is <http://cip.loc.gov/>. The purpose of the program was to “provide the recipient with standardized and professionally prepared cataloguing information that he cannot generate himself, but not to supply data which are readily available to him in the book which he holds.”^[13] Consequently, LC’s CIP would not include subtitles, imprint information, or physical description. However, CIP data would include main entry in its authorized form, a brief identifying title, series statements, notes about the resource, LC subject headings, added entries in their authorized forms, LC call number, a Dewey class number, the LC card number, and any ISBNs associated with the resource. These cataloging data would be supplied based on galley proofs, and a CIP record would be returned to the publisher to reproduce on the verso of the title page of the final publication.

CIP instantly became a very popular service and is now included in the publications of most major American publishers. It was also an excellent match for the newly developed MARC record exchange format: a record might potentially become available to libraries before the resource was even published, and was easily revised when the resource became available in its final form. CIP programs now exist around the world, involving many national libraries including the British Library, Library and Archives Canada, the National Library of Australia, and the Deutsche Nationalbibliothek. LC’s CIP program has recently migrated to an “eCIP” program (“electronic CIP”) under which rather than paper galleys publishers send the Library electronic versions of the manuscript. This has not only resulted in faster and more efficient processing, but it has allowed the Library to consider expanding its partners. It has recently invited major university libraries to participate by producing eCIP for the output of their university presses and has also expanded the program to allow libraries with subject or other specialties to produce eCIP for specialist publishers.

The advent of electronic cataloging did not spell the immediate end of card catalogs for bibliographic control: some libraries continued to use their card catalogs well into the twenty-first century. However, most libraries in the Western world had by then retrospectively converted their cards to electronic format so that the bulk of their inventory was controlled by their Online Public Access Catalog (OPAC). But the idea of sharing electronic cataloging did give rise to the idea of Universal Bibliographic Control (UBC).

UBC was an ideal under which all the world's information resources, whether published or unpublished, would be placed under bibliographic control, i.e., cataloged.^[14] Two approaches were proposed: the creation of a single worldwide bibliography, or alternately (and more realistically), the creation of national bibliographies. The promotion of UBC occupied much of the attention of the cataloging world during the second half of the twentieth century. IFLA spearheaded the movement with its IFLA Universal Bibliographic Control and International MARC Programme (later "Core Activity") (UBCIM). For background on the now-defunct IFLA UBCIM, see documentation at the IFLA website, <http://archive.ifla.org/VI/3/ubcim.htm> and <http://archive.ifla.org/VI/3/ubcim-archive.htm>. During the last 30 years of the century, UBCIM promoted not only the idea of UBC, but was also responsible for the publication of the ISBDs and UNIMARC, an IFLA-sponsored version of the MARC standard developed by the Library of Congress.

The International Standard Bibliographic Descriptions (ISBDs) were first envisaged in the late 1960s to allow a standardized form of content and exchange of bibliographic data. The value of and need for such documentation in the context of UBC is clear and the ISBDs have enjoyed a remarkably broad worldwide acceptance. The first ISBD (for monographs) was published in 1971, and other format-specific ISBDs followed in the ensuing decades. A consolidated version was published in 2007, harmonizing the format-specific ISBDs. A digital version of the consolidated edition of ISBD (Munich: Saur, 2007) is available at http://www.ifla.org/files/cataloguing/isbd/isbd-cons_2007-en.pdf. Nearly all cataloging codes developed since the publication of the ISBDs, including the second edition of AACR, have been based on them.

With the advent of electronic and digital formats and especially the rise of the Internet and the World Wide Web, a serious increase in the amount of information resources occurred, and as of the early twenty-first century, thanks to this rapid increase of these resources, many of the goals of UBC appeared unattainable. The UBCIM Core Activity was disbanded by IFLA in 2003, replaced by the IFLA-CDNL Alliance for Bibliographic Standards (ICABS), a federation of a number of national libraries charged with continuing to support goals of bibliographic control, but with less

emphasis on the ideal of UBC. For information about ICABS, see <http://archive.ifla.org/VI/7/icabs.htm>.

Given the demise of an explicit goal of UBC on the international level, it is somewhat ironic that the notion of a single worldwide bibliography may actually be coming to fruition through the rise of OCLC to near-monopoly status as the database containing the world's cataloging data. As mentioned above, one of the obvious benefits of the invention of MARC was the ability to share and exchange cataloging electronically. However, in order to do this efficiently some exchange mechanism had to be set up. During the late 1960s and early 1970s numerous library consortia organized themselves explicitly for the purpose of creating electronic union catalog databases. This would benefit libraries beyond allowing the sharing of records and thus lowering the cost of cataloging. Such union catalogs were also efficient mechanisms for purposes such as interlibrary loan, allowing the discovery of the location of wanted items. In addition they allowed libraries to see each other in ways they had not been able to before, particularly for comparison of their collections.

Three of the principal consortia developed in the United States during this period were The Ohio College Library Center (OCLC), The Research Libraries Group (RLG), and The Washington Library Network (WLN).

The Washington Library Network was founded in 1976 as a regional union database for libraries in the state of Washington. In view of its expansion to areas of the North American west coast and northwestern Rocky Mountains it changed its name to Western Library Network in 1985, and then to WLN in 1990. Although the focus of WLN was the northwestern United States, it did support libraries from outside the region in Australia, New Zealand, and South Africa. In 1999 WLN merged with OCLC.

RLG was founded in 1974 by Columbia, Harvard, and Yale Universities and the New York Public Library. Its membership expanded across the United States to many other university and research libraries, and its union catalog became known as RLIN. Throughout its history RLG retained its character as a consortium of research libraries, and so its catalog reflected the character and needs of its members, including strong holdings in special and rare materials, and the ability to catalog using vernacular scripts such as Chinese, Japanese, Korean, and Arabic.

RLIN's structure was based on a "clustering" concept. Every member library input its own records for its own holdings (usually "deriving" a new record from some other library's record for a given resource), but records for a single edition of a resource clustered together through a set of complex algorithms. The clustered structure of the database allowed libraries to see the records of any other RLG member, which might differ from one another.

This was a particularly suitable arrangement for research libraries, which often had significant special

collections holdings. Patrons of these collections were often interested in researching unique aspects of the collections, such as books that once belonged to a prominent historical figure, information that could be found on the records of individual libraries.

Aside from RLIN, RLG also developed a number of tools for archival bibliographic control, allowing better access to the holdings of the research libraries' manuscript collections, as well as, later on, tools for union access to members' new digital collections. In 2006 however RLG, like WLN, merged with OCLC. It retains a presence within OCLC as RLG Programs.

Although not the only bibliographic database on the stage today, with 100,000,000 bibliographic records (and counting) OCLC is clearly now the principal source of the world's bibliographic data. OCLC's home page is <http://www.oclc.org/>. A free version of the bibliographic database is available at <http://worldcat.org/>. OCLC was founded in 1967 as the Ohio College Library Center. Like WLN, it was originally the database of a regional library consortium. As it grew it changed its name to Online Computer Library Center, and is now officially known simply as OCLC. OCLC had a different character from RLG, attracting more public and school libraries, although a number of university and research libraries also joined (some were members of both OCLC and RLG). The structure of its database was different as well. Rather than the clustering model followed in RLIN, OCLC had a "master record" model wherein each edition of any resource would have one and only one record. Libraries added a holdings record to the master record to notify database users that they owned an item, and a select group of libraries was allowed to revise master records.

OCLC's merger with RLG precipitated a change in OCLC's database structure. RLG members were accustomed to using the clustered organization of the database and many wanted to continue to receive the benefits of being able to see each others' records after they moved to the OCLC environment. In order to accommodate this, OCLC changed its database structure to allow for "institution records." Under this structure the master record remains the principal record for a given edition of a resource, but a library may, at its discretion, link its own record (the "institution record") to the master record. When the RLIN and OCLC databases merged in 2007 a number of RLG member libraries had their RLIN records added to the OCLC database as institution records, and the number of such records has continued to grow.

In addition to maintaining its mammoth bibliographic database, OCLC is also a significant player in research into various aspects of bibliographic control through its Programs and Research division, supporting undertakings such as analysis of and data mining within the OCLC database, research into automatic classification, projects developing open and persistent URLs, and the development of a "virtual international authority file," a project that is exploring

the feasibility of combining the name authority files of the Library of Congress, the Deutsche Nationalbibliothek, and the Bibliothèque Nationale de France.

There have been a number of recent developments in bibliographic control of potentially great importance to the future. The Statement of International Cataloguing Principles has been noted above. This statement was based in part on two new documents, Functional Requirements for Bibliographic Records (FRBR) and its companion document Functional Requirements for Authority Data (FRAD). FRBR is available at http://archive.ifla.org/VII/s13/frbr/frbr_current_toc.htm (HTML version) or http://www.ifla.org/files/cataloguing/frbr/frbr_2008.pdf (PDF version). The final version of FRAD, when published, will be available through the IFLA Cataloguing Section's home page <http://www.ifla.org/en/cataloguing>.

FRBR is not a cataloging code, but instead a conceptual model of the bibliographic universe. Based on the entity-relationship database model, FRBR works out how bibliographic entities interact with each other. Entity-relationship is a model introduced in the 1970s in which a given data universe is divided into specific entities linked by specific relationships, each of which have specific attributes. In FRBR and FRAD 11 entities are defined: work, expression, manifestation, item, person, corporate body, family, concept, object, event, and place.

The first four of these are called the primary entities because they have to do with resources familiar to bibliographic control, the objects of intellectual creation. "Work" is defined as "a distinct intellectual or artistic creation." When a work is set down in some form it becomes an "expression": "the intellectual or artistic realization of a work in the form of alphanumeric, musical, or choreographic notation, sound, image, object, movement, etc. or any combination of such forms." If the content or form of an expression changes (as when a writer revises a novel, or when the novel is translated into another language) this usually results in a new expression of the same work, or if the change is extensive enough, it can result in a new work. "Manifestation" is "the physical embodiment of an expression of a work." This usually means a publishing event, such as the 1936 publication of Margaret Mitchell's *Gone with the Wind*. If the same content is published again, for example, the 2006 publication of *Gone with the Wind*, this becomes a second manifestation of the same expression. "Item" is a single instance of a manifestation, i.e., a copy.

All FRBR entities have explicit relationships with each other. For example, the work entity might have a "created by" relationship with a person entity (the author). The manifestation entity might have a "produced by" relationship with a corporate body entity (the publisher). A person entity might have a "member of" relationship with a family entity.

FRBR also defines what it calls the "user tasks," i.e., the reasons users come to bibliographic databases.

According to FRBR these are four: 1) users need to *find* materials relevant to their needs; 2) once they have found a group of potential records or resources they need to *identify* the resource retrieved, i.e., confirm that the resource is what they were looking for; 3) they then need to *select* from the resulting group a resource appropriate to their needs; and 4) they need to *obtain* the selected resource.

The focus of FRBR on these user tasks is based on the principle of user convenience, one of the core principles underlying the Statement of International Cataloguing Principles discussed above.

FRBR works best within the entity-relationship database model. In such a database every instance of an entity would have one and only one record, and all entity records would be linked to other entity records by relationship links. For example, the work record for *Gone with the Wind* would be linked to the person record for Margaret Mitchell; the expression records for all expressions of the work (text, spoken word, etc.); concept entity records for the topics of the work (e.g., Scarlett O'Hara, the U.S. Civil War) and forms (e.g., Historical fiction, War stories); and so on. In turn, the person record for Margaret Mitchell would be linked to any other work records for works she created (e.g., *Lost Layson*); the concept entity records would be linked to any other related works (e.g., the concept record for Scarlett O'Hara would be linked to the work record for the film version of *Gone with the Wind* and other works in which she figures prominently such as *My Beloved Tara* by Jocelyn Mims). The expression records would be linked to their appropriate manifestation records, which would be linked in individual libraries to item records.

This exponentially expanding web of linked entity records is very different from the flat-file MARC universe, in which all details pertaining to a single publishing event (the work, the expression, the manifestation, the author, the concepts, etc.) are contained within in a single record. At first glance the complexity of entity-relationship caused many to doubt the utility of such a massive change, but there are overriding advantages both to the creator of the database (e.g., the cataloger) and to the users of the collection.

In the current MARC environment, every time a new record is created for one of the hundreds of publications of *Gone with the Wind*, including translations, revised editions, etc., everything to do with the work has to be repeated in every record. This includes information about the author (including the required standardized form of her name), subject headings, summaries, notes about awards, and anything else pertaining to the work. Ideally all this information should be identical in each MARC record, and any changes to one record (e.g., the addition of a new subject heading or a change in form of the author's name) should be made to all. This is a lot of work. In contrast, in an entity-relationship bibliographic database all this information would either be contained within the work record as attributes (e.g., a plot summary, notes about awards) or

linked to the work record by relationship links (e.g., the author's person entity record, the concept entity records). Any changes would be made only once, at the work level.

From the point of view of the user, too, there are important advantages to such a database structure. In the most common type of interfacing with a MARC database currently used, keyword searching, the user might receive hundreds of hits organized randomly when doing a search on *Gone with the Wind*. In a well-designed entity-relationship database the user might instead initially be presented only with work records, in this case possibly only two, one for the novel and the other for the film. From there the user could choose an expression (e.g., a recording, a French translation, or the original English-language expression). The user would then only see the few manifestation records associated with the chosen expression.

The first cataloging code to be explicitly based on FRBR and FRAD is *RDA: Resource Description and Access*, currently under development (see <http://www.rdaonline.org/>). Designed by the Joint Steering Committee for Development of RDA, it is intended as a replacement for AACR2, and is expected to be released in early 2010. As of this writing (2009) the structure of the code points toward its use in an entity-relationship database, containing instructions for recording attributes of each FRBR/FRAD entity as separate records, and instructions for linking these entities with relationship links. Although it is realized that RDA will first be implemented within a MARC environment, it is clear that its authors intend it to be used eventually within a FRBR-based entity-relationship environment. Although the database structure for this environment has not been designed yet, models within the larger database world exist, which should help development.

One of the driving forces behind the replacement of AACR2 with RDA is the changed environment in which libraries and other similar organizations find themselves at the beginning of the twenty-first century. One of the principal changes to this environment is the proliferation and wide availability of digital resources, both at individual institutions such as libraries and within the larger environment, including the World Wide Web. These digital resources are potentially subject to bibliographic control for the same reasons as physical resources are. And their proliferation has the potential to overwhelm traditional methods of bibliographic control. RDA is intended to address some of these problems, and to attract other communities, including the metadata communities, to use a common standard.

Metadata, a term coined about 1970, means data or information about other data. As such, all the techniques of bibliographic control discussed above produce metadata, since catalog records of all kinds contain data describing other data, i.e., works as embodied in a physical object such as a book. However, the common meaning of the term is data or information about digital objects.

Unlike traditional cataloging, which until recently exclusively described physical objects, and described them in a place physically separate from the objects themselves (the catalog), metadata is often attached directly to the digital object being described. This is possible because electronic metadata, itself digital, resides in the same place (e.g., the Internet, or a database) as the digital objects it describes.

This also makes possible the creation of metadata not only by professional catalogers (as was previous practice), but also by the creators of the objects themselves or their users. Indeed, the huge quantities of digital information resources demand at least some metadata creation by the creators and users of the resources. The nature of digital resources also opens the possibility of automatic harvesting of portions of the metadata from the object itself, with minimal human intervention. Because of all this a need was perceived for a metadata standard that was simpler than traditional cataloging standards. A workshop was hosted by OCLC in 1995 that gave rise to the "Dublin Core" (OCLC is located in Dublin, Ohio), a basic set of 15 elements that could be used for metadata creation. These included elements such as title, creator, subject, language, and date, which were easily understandable by anyone creating a digital object.

The Dublin Core is maintained by the Dublin Core Metadata Initiative (DCMI), which continues to refine the model and develop database architecture and modeling. DCMI's home page is <http://dublincore.org/>. One of its activities is a joint initiative with the creators of RDA. The DCMI/RDA Task Group, formed in April 2007, is charged with defining an RDA element vocabulary in order to make RDA's underlying bibliographic elements reusable in the "Semantic Web" (defined as a common framework that allows data to be shared and reused across applications), and citable with Uniform Resource Identifiers (URIs). Information about the Semantic Web is available at <http://www.w3.org/2001/sw/>. One of the hoped-for results of the DCMI/RDA Task Group is greater cooperation between the metadata and cataloging communities and broader use of RDA beyond traditional cataloging, including by the metadata communities. See information about the Task Group at <http://dublincore.org/dcmirdataskgroup/>.

All of these standards have been developed to facilitate the sharing of bibliographic data, so that data creators such as catalogers do not have to redo work that has already been done by others. Catalogers have long tried to organize themselves so that they could share cataloging, beginning with LC's catalog card sales and progressing to the use of each other's electronic copy through databases such as OCLC. However, the supply of reliable copy has not always been good, and a number of initiatives were attempted during the twentieth century to form alliances among cataloging agencies that followed a common standard and whose records could be used by others with little or no modification.

The most successful of these efforts was the Program for Cooperative Cataloging (PCC). Founded in 1995, the PCC built on successful existing programs for the creation of serial and name authority records. At the present time the PCC has four components: a program for the creation of name authority records called NACO; a program for the creation of subject authority records called SACO; a program for the creation of monographic bibliographic records called BIBCO; and a program for the creation of serial bibliographic records called CONSER. For information about the PCC, see <http://www.loc.gov/catdir/pcc/>. Participants in any of the PCC programs are given extensive training and their work may be subject to quality control by other PCC participants, ensuring a supply of high-quality cataloging data that others can use with confidence. Although much of the PCC's activity is hosted and supported by the Library of Congress, the Program is governed by its member institutions. In 2007 the 624 PCC member institutions contributed nearly 200,000 name and series authority records, about 3,000 subject authority records, over 22,000 serial records, and about 66,000 bibliographic records to the shared databases.

The beginning of the twenty-first century saw a great deal of thoughtful planning for the future of bibliographic control. In 2000 the Library of Congress sponsored the Bicentennial Conference on Bibliographic Control for the New Millennium, which produced an action plan for the Library. (The Papers are published in *Proceedings of the Bicentennial Conference on Bibliographic Control for the New Millennium* [Washington, DC Library of Congress Cataloging Distribution Service, 2001], also available at <http://www.loc.gov/catdir/bibcontrol/conference.html>. The action plan is available at <http://www.loc.gov/catdir/bibcontrol/actionplan.html>.) This was followed by three important and controversial white papers, one on the future of bibliographic services in the University of California system, another on the future of cataloging at Indiana University, and the third a paper on the future of bibliographic control in general, commissioned by the Library of Congress and written by Karen Calhoun. The publication details of these white papers were the following: University of California Libraries, Bibliographic Services Task Force, *Final Report, December 2005: Rethinking How We Provide Bibliographic Services for the University*, <http://libraries.universityofcalifornia.edu/sopag/BSTF/Final.pdf>; Jackie Byrd et al. *A White Paper on the Future of Cataloging at Indiana University*; January 15, 2006, http://www.iub.edu/~libtserv/pub/Future_of_Cataloging_White_Paper.pdf; and *The Changing Nature of the Catalog and its Integration with Other Discovery Tools* final report, March 17, 2006, <http://www.loc.gov/catdir/calhoun-report-final.pdf>, respectively. Fast on the heels of these publications, in November 2006, the Library of Congress convened the Working Group on the Future of Bibliographic Control. After broad, nationwide consultation, the Working Group produced its final report in January 2008 (*On the Record : Report of The Library of*

Congress Working Group on the Future of Bibliographic Control, January 9, 2008, <http://www.loc.gov/bibliographic-future/news/lcwg-ontherecord-jan08-final.pdf>). The Working Group, addressing the bibliographic control community in general and not just the Library of Congress, recommended that

1. The community increase the efficiency of its production through increased cooperation, including use of data from nontraditional sources (including publishers, foreign libraries, etc.).
2. Increase efforts to expose rare and unique materials currently "hidden" because of lack of adequate bibliographic control.
3. Position for the future by recognizing that the World Wide Web is both a technology platform and a platform for the delivery of standards and bibliographic data, and by recognizing that not only people, but also machines will interact with bibliographic data.
4. Incorporate user-supplied information such as social tagging into descriptions and work to realize the potential of the FRBR framework.
5. Strengthen the profession through education and measurements that will inform decision-making.

The Working Group concluded that

The future of bibliographic control will be collaborative, decentralized, international in scope, and Web-based. Its realization will occur in cooperation with the private sector, and with the active collaboration of library users. Data will be gathered from multiple sources; change will happen quickly; and bibliographic control will be dynamic, not static. (*On the Record*, p. 4.)

At a time of great change in the world of bibliographic control this seems as good a statement as any of what the future might bring.

Bibliographical Society (London)

Julian Roberts

Wolfson College, University of Oxford, Oxford, U.K.

Abstract

This entry sets out the principal aims of the Society, as recorded on its Web site, and traces how these have been pursued and achieved since its foundation in 1892, through its meetings, publications, through its Transactions (*The Library*), and since 1992, the awarding of financial help for bibliographical research. Bibliography has evolved, notably under French and German influence, into a world-wide discipline of the History of the Book, and the Society's leading members have played a major part in such ventures as the as yet uncompleted *Cambridge History of the Book in Britain*.

On its Web site, the Bibliographical Society sets out its objectives:

To promote and encourage study and research in the fields of:

Historical, analytical, descriptive, and textual bibliography, the history of printing, publishing, bookselling, book-binding, and collecting; to hold meetings at which papers are read and discussed; to print and publish a journal and books concerned with bibliography; to maintain a bibliographical library; from time to time to award a medal for services to bibliography.

To support bibliographical research by awarding grants and bursaries.

With the exception of the last, none of these objectives would have seemed alien to most members of the Society from its foundation in 1892 to the present time. Funds for bursaries and awards were raised in celebration of the Society's centenary in 1992. The earliest members were also a little unsure of the meaning of the word "bibliography," and there are in early issues of the *Transactions* papers which discussed what would now be considered "subject" bibliography. Two commemorative volumes have been published, on the jubilee and the centenary, 1942 and 1992. Notwithstanding its early concentration on foreign books, mainly of the incunable period and collaboration with the German-based Gesamtkatalog der Wiegendrucke, the Society soon focused on the definitive recording of British books, and upon the textual problems of the Elizabethan and Jacobean drama. The issue of the *Short-Title Catalogue (STC)* in 1926, was a milestone of the former, and W.W. Greg's *Bibliography of the English printed drama to the Restoration*, of the latter. *STC* appeared in a revised edition between 1976 and 1991. The Society also played a major part in the design and completion of the *Eighteenth Century Short-Title Catalogue*. Both the earlier projects involved research in, and publication of, several books of the records of the

Stationers' Company of London. The Society's concentration on pre-1640 English books was rudely interrupted by the exposure of Thomas J. Wise (a former President), but the exposure was the work of two future Presidents, John Carter and Graham Pollard, both—particularly Pollard—influential on the future direction of the Society. Ecclesiastical libraries have always been important sources of early books, and the *Cathedral Libraries Catalogue* begun in 1944, and long in gestation, was completed between 1984 and 1998. The editing and publication of such substantial works proved costly for a members' society, and the British Library offered welcome support for this and later works of scholarship, particularly those requiring extensive illustration. Keith Maslen's edition of the Bowyer ledgers was published in collaboration with the Bibliographical Society of America.

The Society's claim, also on the Web site, that it is the "senior learned society dealing with the study of the book and its history" might indeed be contested by the Edinburgh Bibliographical Society which was established in 1890.

The Society's objectives and achievements have been set out in volumes published on the occasions of its jubilee (1942) and its centenary (1992). *The Bibliographical Society, 1892–1942: Studies in Retrospect*, appeared in 1945, and was reprinted in 1949. The three-year delay was, understandably, caused by the conditions of war which had curtailed the Society's activities in many other ways. The book was edited by F.C. (later Sir Frank) Francis (President 1964), who from the relative security of the British Museum, had shouldered many of the Society's burdens—which included the Honorary Secretaryship and Editorship of *The Library*. *The Book Encompassed: Studies in Twentieth-Century Bibliography* was edited by Peter Davison (Honorary Editor of *The Library*, President 1992, and Gold Medallist 2003), and appeared more punctually. Both volumes, which differ widely in their appearance, are yet a continuing witness to the skills of Cambridge

University Press. Francis was uniquely qualified to write the historical introduction to the earlier volume. He detected a surprising uncertainty in the early objectives, which was perhaps mirrored in its first officials, and this was only resolved with the election in 1893 of A.W. Pollard of the British Museum as the Honorary Secretary of the Society, an office which he held solely until 1912, and jointly with R.B. McKerrow until 1934. The names of Pollard and McKerrow (both Gold Medallists in 1929) will recur in the ensuing entry. The strong connection with the British Museum was crucial to the development of the Society. The Department of Printed Books, under the direction of Panizzi, had become the greatest all-round historical collection, not only of British, but also of foreign books, and in particular of incunabula. And there was another, subtler, influence at work, that of a great museum with incomparable collections of artefacts. Thus it was natural that books should be studied, not only as texts, but as physical objects. The Society's earliest publications related to these foreign books. Despite the premature death in 1903 of Robert Proctor, a member since 1894, who had given the world the concept of "Proctor order" in arranging incunabula, the earliest British connections with the German "*Gesamtkatalog der Wiegendrucke*" were through the Museum and the Society; the Director of the Wiegendruckkommission, Dr. Konrad Haebler had been an Honorary Member since 1905. The Society has since then published both books and articles in *The Library* on fifteenth-century books. It is appropriate that the most recent (June 2008) issue of *The Library* should carry authoritative reviews of the 11th and final volume (on English incunabula) of the British Library's *Catalogue of Incunabula (BMC)*, and of the Bodleian Library's new *Catalogue of Books Printed in the Fifteenth Century*. The former review is by Bettina Wagner of the Bayerische Staatsbibliothek in Munich, who formerly worked on the Bodleian incunable catalog, and the latter by Richard Sharpe, Professor of Diplomatic at Oxford. He draws attention to the Bodleian catalog's concentration on the texts printed; a conscious move, very proper to a university library, away from that on printing houses, which was a legacy from Proctor. Two of the Society's Gold medalists, Konrad Haebler (1929), and Victor Scholderer (1951, and President 1946) were perhaps best known as incunabulists.

It was in a paper by A.W. Pollard, delivered in 1913, that the author described the work of the Society on English printers as "meagre and scrappy." This is a slightly dismissive judgement of what had so far appeared; Gordon Duff's *A Century of the English Book Trade* in 1905 (reprinted in 1948); the *Hand-Lists of Books printed by London Printers, 1501–1556*, of 1913 (which as Pollard writes in his Preface "were begun at my suggestion as long ago as 1894"); and the series of four Printers' Dictionaries which began in 1907, and were followed by others taking the coverage up to 1775, finishing in 1932. Their abiding

worth was recognized by their being reprinted by the Society in a single volume in 1977. They owed much to the archival investigations of H.R. Plomer (1856–1928), which I can personally testify, are still of value in this and related fields.

Pollard's sights were, however, by 1918, set upon a project which had at least been aired in the Society's earliest years, a "Short-Title Catalogue of English Books, 1501–1640." This owed a lot to the British Museum's own catalog of 1884. But by 1920, no bibliographer could be unaware, not only of collections of pre-1640 books in other British libraries, but of the increasing numbers moving westwards across the Atlantic. Nevertheless, the objective of Pollard and of his collaborator Gilbert R. Redgrave, was realized in the astonishingly brief period of eight years, and the "short-title catalog (STC)" of 1926 became the ancestor of a series taking the record up to 1800, and in which the Society has been, in various degrees, involved. It could do little more than bless the continuation 1641–1700 by Donald Wing of Yale University. Wing paid STC the compliment of imitating its style of entry closely, though making the obvious improvement of replacing the numeric location code with a more memorable alphabetic code, such as "LLP" instead of "L2," to signify Lambeth Palace Library. Nor did he allow himself to be deterred, as perhaps his predecessors had been, by the dramatic rise in printing output occasioned by the Civil War. Yet the revision of the 1475–1640 STC, undertaken in 1948 by F.S. Ferguson and W.A. Jackson, was always a Society project. The history of this project, which outlived both editors, and was brought to a triumphant conclusion in three volumes, 1976–1991, by Katharine F. Pantzer, originally Jackson's assistant at Harvard, has been told in the prefaces to the three volumes, of which the second (I–Z) was published first in 1976 (with an anonymous Preface by the present writer), volume 1 (A–H) in 1986, and volume 3 in 1991. The last contains several indexes, of which the first, of Printers and Publishers, encapsulates the unique knowledge of this part of the book trade which Dr. Pantzer had gained in the course of the revision, and largely, though not entirely, obviates the need for a revised Printers' Dictionary of the period. She was awarded the Society's Gold Medal in 1988. The Society remained the publisher, though the financial requirements of editing and publication proved to be far beyond the resources of a relatively small members' society, and occasioned several efforts of fundraising in Britain and the United States.

There was a determination, nevertheless, in the Society's ranks that something more than the benevolent neutrality (and war-induced impotence) that had been shown toward Donald Wing's enterprise, would have to be displayed, if a continuation to Wing's STC were called for. Preoccupation with the "New bibliography," and in particular with the textual problems of the Elizabethan and Jacobean drama (a subject which calls for extended discussion, below), had perhaps distracted attention from the

bibliography of the eighteenth and later centuries. However, in 1962, consideration was given to the possibility of an eighteenth-century short-title catalog. The Sub-Committee of the Society's Council appointed to consider it was chaired by the bibliographically omniscient President, Graham Pollard, and included Sir Frank Francis, and two of the Society's most knowledgeable *dix-huitièmistes*, L.W. Hanson and D.F. Foxon. The report they produced remained on the table until 1976, when a conference was called by the newly established British Library and the American Society for Eighteenth-Century Studies. Contributions to the conference by members of the Society, including the present writer, then Honorary Secretary, were prominent. In the end the *English Short-Title Catalogue* (ESTC), as it soon became known, came into being under the editorship of Robin Alston (President 1988 and Gold Medallist 1997), not in hard copy, but in electronic form, and to it have been added the contents of the Society's 1475–1640 volume and the 1641–1700 volume (under the auspices of the Modern Language Association). The ESTC is now run, and updated, by the British Library and ESTC (North America) at Riverside, California

The enumerative bibliography of early books was seen by W.W. Greg (President 1930, Gold Medallist 1935) as “one of the first tasks of bibliography” (*Studies in Retrospect*, 1945). He began this task very early in his membership of the Society, which he joined in 1898, with *A List of English Plays written before 1643 printed before 1700* (1900) and *A List of Masques, Pageants etc. supplementary to A List* (1902). Greg's single-minded devotion to the study of English drama had begun with his friendship at Cambridge with R.B. McKerrow, and came to a culmination only in the year of his death (1959) with the final volume of his *Bibliography of the English Printed Drama to the Restoration*. The first two books were the Society's earliest contribution to English literary studies, and Greg followed them with editions of *Henslowe's Diary* and *The Henslowe Papers* (1904–1908, not published by the Society). Greg and McKerrow were, in their scholarly examination of Elizabethan and Jacobean drama, joined by A.W. Pollard, whose interest had been aroused in the course of his museum duties, by a bound copy of the “Pavier Quartos” of “1619,” brought in for examination, and now in the Folger Library. Greg, in particular, challenged the reigning orthodoxy of Sir Sidney Lee on the subject of the unreliability of the Shakespeare quartos and First Folio. This formed the subject of Pollard's own *Shakespeare Folios and Quartos* of 1909, and his Sandars Lectures published in *The Library* from 1916, and his *Shakespeare's Fight with the Pirates* (1920).

F.P. Wilson's *Shakespeare and the New Bibliography* is by far the longest contribution to *Studies in Retrospect*, and solidly established the Society's claim to have “made a difference” to literary scholarship. Wilson saw the Society as “leader and inspirer of these studies,” “due in the

main to three of the outstanding members of the Society,” Pollard, Greg, and McKerrow.

The presence of these men in the British Museum from necessity or choice or both made that library and the neighboring restaurants—especially during the summer migration from America—the best centre for Elizabethan studies in the world.

The subheadings in Wilson's article are suggestive, as they underline the necessity of documentary evidence in addition to the study of the book as a material object: 1) copyright and the relations between author, publisher, and bookseller; 2) the interpretation of imprints; 3) entry or non-entry in the Stationers' Register; 4) licensing; and 5) piracy. These are topics which pre-date the Bibliographical Society, and are still under discussion. Robin Myers in her paper “Stationers' Company Bibliographers: the first 150 years: Ames to Arber” in *Pioneers in Bibliography* (1988) demonstrates that bookmen had for a long time been making use of the Company's records. The foundation stone for the investigation of the collateral, archival evidence called for by F.P. Wilson, was laid by Edward Arber (1836–1912). He was never, apparently, a member of the Society, but his *Transcription of the Registers of the Company of Stationers of London 1554–1640*, (1875–1895), in Robin Myers' words “heralded the ‘new bibliography’ of Pollard, Greg, Plomer, and others by giving scholars access to a large enough amount of the early records to enable them to work at a distance from Stationers' Hall.” Where Arber had led into early records, the Society followed, with *Records of the Court of the Stationers' Company, 1576–1602*, edited by Greg and E. Boswell (1930); *Records of the Court 1602–1640*, edited by William A. Jackson (1957); *The Loan Book of the Stationers' Company...1592–1692*, edited by W. Craig Ferguson (1989); and, most recently, *Index to the Court Books...1679–1717*, edited by Alison Shell and Alison Emblow (2007). Graham Pollard proposed an edition of “Stationers' Liber A,” but neither he nor D. F. McKenzie who took up the task were able to complete it. A photographic facsimile, originally prepared for Pollard, provided me with the names of “Brothers” of the Company—aliens who were engaged in the importation of books—for work on the “Latin Trade.” “Liber A” remains in prospect for publication.

Greg's magnificent four-volume *Bibliography of the English Printed Drama to the Restoration* (1939–1959) was completed in the year of his death, and reprinted by the Society in 1962. A summation of Greg's unparalleled scholarship over a period of 60 years, it is also a sustained example of quasi-facsimile transcription at its most elaborate. Ending his contribution to *Studies in Retrospect*, Greg presciently named two American scholars, Fredson Bowers and Charlton Hinman as providers of valuable bibliographical analysis. Of these, Hinman had already

given in *The Library* of 1940 a foretaste of his monumental *The Printing and Proof-reading of the First Folio of Shakespeare* (1963); Bowers (Gold Medallist 1969) was a frequent contributor to *The Library* (and to his own *Studies in Bibliography*) and speaker before the Society. Despite his differences with Greg over bibliographical description, he cherished a hope of continuing Greg's *Bibliography* up to 1700.

Hinman's great work was able to distinguish several different compositors at work in Jaggard's shop on the First Folio. It is thus the only begetter of a school of compositor analysis, directed largely upon the drama of the period. Bibliographical research can establish the nature and reliability of the copy underlying a printed text, but it is less good at emending a corrupt text. Or it can point out that differing texts may be equally valid, representing different stages of an author's intentions. Thus the recent Oxford *Complete Works* of Shakespeare (1986), edited by Stanley Wells and Gary Taylor, prints two versions of *King Lear*; prints the Folio version of *Hamlet*, but has an addendum of two and a half pages from the Quarto version (which appeared in the poet's lifetime); publishes the Folio *Othello*, which is 160 lines longer than the Quarto of 1622; and several other plays have briefer additions at the end, which may be perfectly authentic Shakespeare—who was not around to decide which version should go down to posterity. As for the actors and producers, they will do what they have been doing ever since at least 1600—act and produce whichever version they prefer, or have time for.

There is an ironic footnote to F.P. Wilson's words (above) about the society of friends who met at the British Museum from necessity or choice. For it was there that Pollard and McKerrow met and discussed the impact of *An Enquiry into the Nature of Certain Nineteenth Century Pamphlets* (1934) by John Carter and Graham Pollard. The book implied that Thomas James Wise had forged and sold some of the most sought-after literary pamphlets. Wise (President 1922) was seen as the Society's principal expert in the nineteenth century, a period which the Society had perhaps neglected. It was felt that the novelty and standard of bibliographical scholarship merited Gold Medals. Perhaps Wise did too; they felt an affection for him. Both Pollard and Carter became Presidents (1960 and 1968) and Gold Medallists (1969 and 1975). When Wise died in 1937, his Ashley Library was sold to the British Museum for £66,000. That A.W. Pollard's affection for him would have survived the discovery that it contained 89 of the 206 leaves stolen from the British Museum, mostly from the Garrick collection of plays, is unlikely. The discovery of the thefts was made in the course of cataloging the Ashley Library by David Foxon (President 1980, Gold Medallist 1984), and was published by the Society in 1959 as *Thomas J. Wise and the Pre-Restoration Drama*. The subject of a Presidential Address by Simon Nowell-Smith (President 1962), himself a

bibliographer and collector in Wise's "period," was "T.J. Wise as Bibliographer." It seems that Wise himself did not give a Presidential Address. In 1983, Nicolas Barker (President 1983, Gold Medallist 1999) published, with John Collins, *A Sequel to An Enquiry*, which showed that Wise, had an accomplice in the creation and marketing of the forgeries, Harry Buxton Forman.

In 1943, the Society and the Pilgrim Trust were asked to support a union catalog of pre-1700 books in the Anglican cathedrals of England and Wales, and in 1944 the catalog's creator, Miss Margaret Hands, began work at Worcester. The optimism so often found at the beginning of such schemes, fuelled (if that is the right word) by a certain naivety about what work in cathedral libraries is like, led to a far greater time-span of work than had originally been envisaged; so that with the exhaustion of the Pilgrim Trust's original grant, and the retirement of Miss Hands upon marriage, led to the lapsing of the catalog. Nevertheless, the handwritten slips remained accessible in the North Library of the British Museum. Six libraries remained uncataloged, among them three of the largest. Mrs. McLeod (as Miss Hands had become) returned to catalog Carlisle. Several other factors combined to its revival and ultimate publication. One was the existence, (in the case of Durham), or foundation of universities in or near, cathedral cities. Another was a provision in the British Library Act for assistance to be given to cataloging projects outside the British Library. The *Cathedral Libraries Catalogue* was published by the Society and the British Library in three volumes from 1984 to 1998. The Editor-in-Chief was (appropriately) Dr. David Shaw of the University of Kent at Canterbury (President 2002). It was also fitting that a French specialist should edit a catalog, the bulk of which contained books printed on the Continent of Europe before 1701.

The Society displayed a related concern for lesser, parochial, libraries, in its publication in 2004 of Michael Perkin's *Directory of the Parochial Libraries of the Church of England and the Church in Wales*, itself deriving from *The Parochial Libraries of the Church of England*, edited in 1959 by N.R. Ker (Gold Medallist 1975).

The centenary in 1992 coincided with the achievement of the Society's longest and most arduous tasks, STC. It also saw the maturing, if not the final completion of the *Cathedral Libraries Catalogue*. Another publication, *The Bowyer Ledgers*, edited by Keith Maslen and John Lancaster, published in 1991 in collaboration with the Bibliographical Society of America, had its origins among the desiderata of Graham Pollard's presidency, while *John Dee's Library Catalogue* (1990), edited by Julian Roberts (President 1986) and Andrew G. Watson (Gold Medallist 2001) had a gestation period of a mere 15 or 16 years.

The increasing financial strain of producing and distributing bibliographical works of quality, sometimes requiring illustration, has led the Society into collaboration

(as in the case of *The Bowyer Ledgers*, above). Collaboration has already been noted with the British Library over *The Cathedral Libraries Catalogue*, and the British Library also appears in the imprint of two recent publications which are generously illustrated, *Eloquent Witnesses: Bookbindings and their History*, (2004) edited by Mirjam M. Foot (President 2000), and *The Earliest Books of Canterbury Cathedral: Manuscripts and Fragments to c. 1200* (2008) by Richard Gameson. The Society has just announced its support for another collaborative venture in "Watermarks in English Fifteenth-Century Books," a project with strong international links. The Society also supported the conference "Collecting Revolution: the Historical Importance of the Thomason Tracts" (2008) in which several members read papers.

There now exist a great many outlets, both national and regional, for bibliographical research beyond the Society. Some of these were noted in *The Book Encompassed*; others are the Book Trade History Group, of which the late Peter Isaac (President 1994) was a founder, and the annual conferences organized by Robin Myers (President 1996) and others, whose proceedings have appeared since 1981 as the Publishing Pathways series. Particularly significant are two series, the *Cambridge History of Libraries in Britain and Ireland* (three volumes, 2006) and the ongoing *Cambridge History of the Book in Britain* (1999–, of which seven volumes are promised). If a personal example is permissible here, my Presidential Addresses of 1987–1988 appeared, not over the Society's imprint, but as a chapter "The Latin Trade" in volume 4 (2002) of the *Cambridge History of the Book in Britain*.

As the very earliest publications suggest, there has always been a powerful international concern. In 2000 the Society published *A Dictionary of Members of the Dublin Book Trade 1550–1800* by Mary Pollard. An even wider international concern dominates the reviews, in the "Recent Periodicals and Books" and "Books Received" sections of *The Library*. The most recent Gold Medallist, Dennis Rhodes (2007), is best known for his work on Italian books. Other recent honorands have been Bernhard Fabian (1999, also the Honorary Secretary for Germany), and Henri-Jean Martin (1994). The influence of the latter on British bibliography has been profound. As D.F. McKenzie somewhat mischievously noted in his contribution to *The Book Encompassed*, "'The Book' has still a ring of an imported phrase"—as in "L'Apparition du livre" or, more widely, in "L'Histoire du livre." Imported abstraction or not, it is now canonized in the title of the Cambridge series, or as one of the Society's objectives in, for example, the Society's "Publications Policy" in *The Library* for March 2008.

I now turn to the other objectives of the Society, as set out at the beginning of this entry.

Membership. After the uncertainty of the earliest years, the membership grew steadily, until the Council decided that the roll of members should be limited, as far as Great

Britain was concerned, to 300. The number of American members was 62 by 1894, and an American Secretary, E. D. North, was appointed. The limit upon numbers was dropped by 1919, and none has since been imposed. The Annual Report for 2006–2007 gave a total of 885 members. "Academics" form a far higher proportion of the membership than they did a century ago. The somewhat elastic requirement that a new member should be proposed by an existing member has now been dropped in favor of a simple statement of bibliographical interests. The original subscription of "one guinea" (£1.05) has risen (2008) to £33 for U.K. members and \$65 for Americans. If the impression was given early of a "gentlemen's club" this was soon dispelled by the election of women members, as was fitting and, indeed, inevitable for a society so closely linked to the profession of librarianship. Nevertheless, the Society had to wait until 1996 for its first woman President, Robin Myers. Since then, there have been two women Presidents, Mirjam Foot in 2000 and Elisabeth Leedham-Green in 2006. Katharine F. Pantzer, principal editor of the revised STC, was awarded a Gold Medal in 1988.

The Society's Officers are, a President, elected for a term of two years, Vice-Presidents, an Honorary Secretary, an Honorary Treasurer, and an Honorary Editor of *The Library*. The governing body is an elected Council. Something of the spread of the Society's influence may be gathered from the existence, in addition to an Honorary Secretary and Treasurer for America, of Secretaries for Japan, Germany, and Australia.

Meetings. There are normally six meetings during the "winter" season, which have for some time been held at University College, London, though the custom of holding the Annual Meeting at various other historic libraries in London has grown up. A summer meeting is held at such a library outside London. Two of the sessional meetings are "named" meetings; the Graham Pollard Memorial Lecture, devoted, if possible to one of Pollard's interests, and the endowed Homee and Phiroze Randeria Lecture. The latter, devoted to bookbinding, is a recent and welcome development for a Society which has been presided over by such eminent scholars of bookbinding as H.M. Nixon (1972), A.R.A. Hobson (1977), and Mirjam M. Foot (2000).

"*The Library.*" *The Library* was begun by J.Y.W. (later Sir John) MacAlister in 1889. He was then Honorary Secretary of the Library Association, and the first three series were published independently of the Society, though members, particularly A.W. Pollard who helped edit it, contributed to it. The "official organs" of the Society were then the *Transactions* and the *News Sheet*. The two journals were amalgamated in 1920, so that the second series of the *Transactions* was also the fourth series of *The Library*. The latter has so flourished that it is now (from 2000) in its seventh series. It is now appears quarterly, and is published for the Society by the Oxford

University Press. As it is an "Oxford journal," the full text from its foundation is available online. The details of this, and of all other publications, appear regularly in *The Library*.

The Society's library. This is perhaps the least perfectly realized of the Society's objectives. It has had a number of locations of limited accessibility; the former Rooms of the British Academy in Burlington Gardens, University College, London, Stationers' Hall, and most recently in the Senate House Library of London University. Borrowing from here is not possible, though the contents are accessible online, through the University of London Research Library Services catalog.

The Gold Medal. An endowment for a Gold Medal for services to bibliography was offered by Eustace Bosanquet in 1929. The amount was then sufficient for the award of five medals, which were, as they still are, awarded on an international basis. A post-war increase in the price of gold, and a decrease in the value of the fund, made it necessary for the medal to be struck in silver-gilt. The award is made on the recommendation of a special subcommittee of Council. The recipients since 1929 are listed on the Society's Web site.

Grants and bursaries. The impetus to raise an endowment for such awards was a feature of the Centenary celebrations of 1992, and is principally due to Barry Bloomfield (President 1990). After his death in 2002, his widow made a gift from his estate to fund an award for study in his own fields of interest, connected with the India Office Library, and modern literary bibliography. Major awards of up to £2000 are made annually on the recommendation of a subcommittee of the Council, and are advertised in the national press. In addition to other "named" awards, the Society, benefiting (in common with the Bibliographical Society of America) from the will of Katharine F. Pantzer Jr., who died in 2005, can award a fellowship of up to £4000 and a scholarship of up to £1500, named after her. Details of the awards made appear in *The Library*.

Bibliographical Society of America (BSA)

Hope Mayo

Houghton Library, Harvard University, Cambridge, Massachusetts, U.S.A.

Abstract

The Bibliographical Society of America (BSA) is the oldest scholarly society in North America dedicated to the study of books and manuscripts as physical objects. It was organized in 1904 and incorporated in 1927 with the principal objectives of promoting bibliographical research and issuing bibliographical publications. These objectives have been and continue to be accomplished through a broad array of activities, including meetings, lectures, and fellowship programs, as well as the publishing of books and the *Papers of the Bibliographical Society of America* [PBSA], North America's leading bibliographical journal. The society is open to all those interested in bibliographical problems and projects, and its membership includes bibliographers, librarians, professors, students, and collectors worldwide. Libraries are welcome as institutional members.

The Bibliographical Society of America (BSA) is the oldest scholarly society in North America dedicated to the study of books and manuscripts as physical objects. It was organized in 1904 and incorporated in 1927 with the principal objectives of promoting bibliographical research and issuing bibliographical publications. These objectives have been and continue to be accomplished through a broad array of activities, including meetings, lectures, and fellowship programs, as well as the publishing of books and the *Papers of the Bibliographical Society of America* [PBSA], North America's leading bibliographical journal. The society is open to all those interested in bibliographical problems and projects, and its membership includes bibliographers, librarians, professors, students and collectors worldwide. Libraries are welcome as institutional members.^[1]

The body of this entry has been adapted from the presidential address delivered at the 100th annual meeting of the Society, 23 January 2004, and subsequently published as: Mayo, H. The Bibliographical Society of America at 100: Past and Future. PBSA **2004**, 98 (4), 425–448. Used by permission of the Bibliographical Society of America.

FOUNDING AND OBJECTIVES

The BSA was founded on October 18, 1904. It was one of a number of scholarly and professional societies organized in the Anglo-American world during the late nineteenth and early twentieth centuries, including the American Library Association (1876), the Library Association, Great Britain (1877), the Edinburgh Bibliographical Society (1890), and the Bibliographical Society, London (1892). Organizations such as these served to create and reinforce professional identity; through meetings, publications, and correspondence they promoted scholarly

communication; and they sought to organize knowledge in their fields, as well as, in most cases, codifying standards of scholarly investigation and professional conduct. In the United States, the late nineteenth and early twentieth centuries saw a kind of knowledge explosion, with the founding of research universities, such as Johns Hopkins (1876) and University of Chicago (1890), as well as the transformation of older colleges, such as Harvard and Yale, into similar institutions. These developments were accompanied by the formation of research libraries and by increased publication in all disciplines. In an age when publication meant print, and there were no union catalogs, making this abundance of information accessible to those who needed it was a priority for librarians and for learned societies. At a time when the American Historical Association and similar organizations in other disciplines formed committees on bibliography, and the American Library Association discussed creating a Bibliography Section, it is not surprising that there should have been a move to form a Bibliographical Society, reflecting a view that bibliography was a discipline with its own techniques, standards, and contributions to be made.

It is impossible to discuss the founding and the history of the BSA without giving some attention to its predecessor, the Bibliographical Society of Chicago. The individuals who formed the Chicago society were for the most part the same ones who were responsible for organizing the BSA 5 years later. These men and women, representatives of institutions such as the John Crerar Library, the Newberry Library, the Chicago Public Library, and the University of Chicago Library, were conscious that they were forming an organization that would differ deliberately from library clubs and the American Library Association on the one hand, and from book collectors' clubs, such as the Grolier Club and the Caxton Club, on the other. At the organizational meeting of the Chicago

society, Aksel Josephson of the John Crerar Library, convenor and chair of the organizing committee, remarked:

The object—the sole object—of the society should be bibliographical study and research. Our work should cover the whole range of the history of the book—printing, illustration and binding, publishing and bookselling, history and management of libraries, and last, but not least, bibliography proper, the registry of printed books and the recording of their contents. We wish to enlist the interest and cooperation of the bibliographer and the librarian, of the student of literature and literary history, of the private collector, if he is willing to make his library available to students, and of the printer and bookseller for whom his trade is something more than a means of making money.^[2]

These objectives are remarkably similar to those that still inform the work and character of the BSA. From the beginning, the founders intended that the creation of the Bibliographical Society of Chicago should lead to the formation of an American Bibliographical Society, a topic proposed at their first meeting and often discussed thereafter. To that end, they held frequent meetings, both in Chicago and in conjunction with conventions of the American Library Association. They began a journal—four volumes of the *Year-book of the Bibliographical Society of Chicago* appeared between 1900 and 1903—and they published two small monographs, all in an effort to establish a record of professional activity and national visibility. With the formation of the BSA, the Chicago society transformed itself into a chapter of the BSA and continued to hold local meetings until in 1912 it voted to dissolve itself and transfer its assets to the national society.

ORGANIZATION

At its organizational meeting, the BSA adopted a constitution which stated that “The name of this society shall be the Bibliographical Society of America” and that “The object of the society shall be to promote bibliographical research and to issue bibliographical publications.”^[3] Officers were elected, including: William Coolidge Lane, Harvard University Library, President; Herbert Putnam, Librarian of Congress, First Vice President; Reuben Gold Thwaites, Wisconsin State Historical Society, Second Vice President; Charles Alexander Nelson, Columbia University Library, Secretary; and Carl B. Roden, Chicago Public Library, Treasurer. Wilberforce Eames was named librarian, and a council of five members was chosen. In 1938, the office of Librarian was discontinued, and the position of Permanent Secretary, subsequently called Executive Secretary, was created to handle the ongoing administration of the Society’s business. At present, the BSA is governed by an elected council consisting of the officers (President, Vice President, Secretary, and Treasurer) and 12 councillors.

MEETINGS

In its early years, the BSA held general meetings twice a year, often in conjunction with conferences of the American Library Association, the American Historical Association, or other similar organizations, e.g., the American Association for the Advancement of Science, the American Historical Association, or the American Association of Law Libraries. One result was that meetings took place in various parts of the country or occasionally in Canada. Between 1904 and the end of 1941, the Society met in more than 35 different American cities in 22 states, from coast to coast, and in Ottawa, Toronto, and Montreal, Canada. The practice of meeting exclusively in the Northeast originated during World War II, and since 1960 all the official, annual meetings of the Society have been held in New York City.

Joint meetings with other scholarly and professional societies and meetings in various places produced programs reflecting bibliographical topics of local interest or the interests of the partner organization. For example, the 1908 conference in Richmond, with the American Historical Association, offered several papers on the bibliography of publications from or about the Confederate States of America; the 1911 meeting in Pasadena, with the American Library Association, heard a presentation on the lost history of Father Kino; the 1922 meeting in Ann Arbor focused on the materials for American history in libraries of the Great Lakes region; and the New Haven meeting of 1931 dealt with topics related to Connecticut printing history and to Yale University. On other occasions, the Society identified themes reflecting its own interests and organized panels to discuss them: for example, “Bibliography Today: Where Do We Stand”? (1959), “Bibliography and the Collecting of Historical Materials” (1964), “Bibliographical Techniques in the Ancient World” (1965), “Bibliographical Needs and Problems of Collectors, Librarians, and Booksellers” (1966), “Prospects for an Eighteenth-Century STC” (1977), and “Techniques of Shared Cataloging” (1981). Since the 1970s, the program at the annual meeting has usually consisted of a single address by an invited speaker. Throughout the history of the Society most of the papers presented at its meetings have subsequently been published in the *Papers of the Bibliographical Society of America*.

During its early decades the BSA relied on frequent meetings, meetings in various parts of the country, and joint meetings with kindred learned and professional societies to provide interest, variety, and broad programming appeal. After the practice of meeting annually in New York City had become well established, the Society instituted a regional or joint meetings policy, intended to encourage other organizations and institutions to host bibliographical gatherings in other parts of the country. A number of such meetings were held in the 1908s. More recent examples include “The History of Libraries in the

United States" (Philadelphia, April 2002), and, celebrating the Society's centennial, "Roughing It: Printing and the Press in the West" (St. Louis, October 2004). The Bibliographical Society of America also underwrote invitational conferences on the *Bibliography of American Literature* (BAL) (1992), on "Book Catalogues" (1995), and on "Marks in Book" (1997), the proceedings of which were published as special issues of *PBSA*. Since 2000, the Society has sponsored lectures or paper sessions at conferences of the American Printing History Association (APHA) and the Society for the History of Authorship, Reading, and Publishing (SHARP), at pre-conferences of the Rare Books and Manuscripts Section (RBMS), and at the St. Louis Conference on Manuscript Studies.

FELLOWSHIPS AND PRIZES

The Bibliographical Society of America funds several programs intended to promote bibliographical scholarship. A number of short-term fellowships of 1 or 2 months are awarded annually to support investigations of bibliographical topics, as well as research into the history of the book trades and publishing history. Eligible topics are defined as those concentrating on books and documents in any field, but focusing on the book or manuscript (the physical object) as historical evidence. The New Scholars Program funds early-career scholars who have been invited to deliver papers on bibliographical subjects at a forum immediately preceding the BSA annual meeting. The Society also awards three prizes: The William L. Mitchell Prize for Bibliography or Documentary Work on Early British Periodicals or Newspapers, the Justin G. Schiller Prize for Bibliographical Work on Pre-Twentieth-Century Children's Books, and the St. Louis Mercantile Library Prize in American Bibliography.

PUBLICATIONS

The publications sponsored by the Society include a periodical, monographs, and electronic publications. Funding for this activity central to the Society's mission has come primarily from endowed funds derived from bequests from George Watson Cole and Lathrop C. Harper, supplemented by grant funding in the case of some larger projects.

Periodical Publications

The publication of a bibliographical periodical was discussed at the founding meeting of the Society and recommended at the very first meeting of the Council. The journal itself came into being in 1906. The first number, printed in April 1906, was denominated *Bibliographical Society of America Proceedings and Papers Volume*

One Part One 1904–1905. The second number, *Volume One, Part Two* was printed in 1907 and covered the years 1906–1907. Also in 1907, the Society began publishing *The Bulletin of the Bibliographical Society of America*, which included proceedings of the Society's meetings, news, and notes, and listings of American bibliographical publications. After 1912, the *Bulletin* was discontinued and its contents were merged into the journal, which, starting with volume 4 (1909), was entitled *Papers of the Bibliographical Society of America*. Volume 100 of the *Papers* appeared in 2006. The objectives of the Society's periodical publications were well expressed by William Coolidge Lane, its first president, in the first issue of the *Bulletin*:

With this first number of a Bulletin, the BSA begins in a humble way the issue of a quarterly record of American bibliography. Whether it will prove useful, whether it is to succeed in bringing together the material it seeks, what it may eventually become, are all questions for the future. . . . Without constant help from a wide circle of correspondents, the Editors cannot make this bulletin what they wish it to be—a record of current bibliographical work in America, such a record as will be of value to all book lovers, book collectors, book workers, and book purveyors (librarians). . . . Any serious bibliographical work undertaken in America, as well as any such work relating to America undertaken abroad, is included in its scope. . . . The greater part of the titles recorded in this Bulletin will be of special bibliographies of various kinds, but works on the science and art of bibliography, works on manuscripts and public archives, accounts of library collections, both public and private, and the more important library catalogs, and contributions to the history of printing and book-selling will all find a place here.^[4]

This breadth of scope and purpose still characterize *PBSA*, which has published articles relating to all branches of bibliography and what is now called book history. In the words of the current guidelines for contributors,

Contributions to the *Papers* may deal with books and manuscripts in any field, but should involve consideration of the book or manuscript (the physical object) as historical evidence, whether for establishing a text or illuminating the history of book production, publication, distribution, or collection, or for other purposes. Studies of the printing, publishing, and allied trades are also welcome.^[5]

Between 1926 and 1951 the Society also published, at irregular intervals, 71 numbers of a *News Sheet* which printed announcements of and reports of meetings, lists of new members, notes and queries, and notices of bibliographical works published or in preparation. Lists of members were published at irregular intervals from 1905 to 1979, and yearly since 1982. From 1981 through 2006, the business documents of the Society, that is, the minutes of annual meetings and the annual auditor's reports, were

published in *PBSA*. Since 2007, these records have been printed in the annual list of members. Other business and administrative records exist in the Society's archives, formerly kept at the American Antiquarian Society and now hosted by the Grolier Club of New York City.

Monograph Publications

A complete list of the thirty-seven monographs published to date by the BSA may be found on the Society's Web site (<http://www.bibsocamer.org>). The Society's monograph publishing program was inaugurated in 1919 with the publication of the first *Census of Fifteenth-Century Books Owned in America*, edited by George Parker Winship. The second *Census of Incunabula in American Libraries* appeared in 1940, edited by Margaret B. Stillwell; the third *Census*, edited by Frederick R. Goff, in 1964; and a supplement to the third census in 1972. In 1980, the BSA granted permission to the British Library to keyboard the contents of Goff as the basis on which that library would develop its Incunabula Short-Title Catalogue, an electronic catalog that is now the most comprehensive listing of incunable editions and locations of copies. Other significant contributions to incunable studies have appeared as articles in *PBSA*.

Second in the series of the Society's monograph publications was the continuation in 1927, and the eventual completion in 1936 of Joseph Sabin's *Bibliotheca Americana: A Dictionary of Books Relating to America*. Work on this monumental compilation was first interrupted in 1881, with the death of Sabin himself. It was then taken up by Wilberforce Eames, who between 1884 and 1892 brought the alphabet from "Pennsylvania" to "Smith." After that, the project lapsed again until the mid-1920s, when the BSA, with funding from the Carnegie Corp., took on responsibility for the work. Between 1927 and 1929 parts 117–121 were completed under the supervision of Eames himself, and the remaining parts, through 172 and the end of the alphabet, were edited by R. W. G. Vail. The completion of Sabin's work was followed by the publication of a series of bibliographies of early American printing organized by state: Albert H. Allen, ed., *Arkansas Imprints, 1821–1876* (1947); Albert H. Allen, ed., *Dakota Imprints, 1858–1889* (1947); John Eliot Alden, ed., *Rhode Island Imprints, 1727–1800* (1949); and Lester Hargrett, *Oklahoma Imprints, 1835–1890* (1951). These grew out of the WPA-funded American Imprints Project of the Depression era, and were taken over by the Society after the death in 1944 of Douglas McMurtrie, who had been the director of that project. Other monographs in the area of American bibliography have included *A Bibliography of Oliver Wendell Holmes*, by Thomas F. Currier and Eleanor M. Tilton (1953); Roger P. Bristol's *Supplement to Charles Evans' American Bibliography* (1970); and Hazel A. Johnston's *Checklist of New London, Connecticut, Imprints, 1709–1800* (1978).

The Bibliographical Society of America's most significant contribution in the area of Americana has been the *Bibliography of American Literature [BAL]* published in nine volumes between 1955 and 1991. Begun by Jacob Blanck, who edited volumes 1–6, and completed after by Blanck's death by Michael Winship, the project was supported by funding from J. K. Lilly and the National Endowment for the Humanities. A comprehensive bibliography of the first editions of selected American literary authors, *BAL* pioneered in applying modern bibliographical principles and techniques to the study of nineteenth-century books and showed how analysis of their physical characteristics could help elucidate nineteenth-century printing and publishing history.^[6] In 1997, a digitized version of *BAL* was made available on CD-ROM or by subscription on the Web.

Some other areas represented in monographs published by the BSA are dictionaries of the book trades: C. Paul Christianson, *A Directory of London Stationers and Book Artisans 1300–1500* (1990); Sidney F. Huttner and Elizabeth S. Huttner, *A Register of Artists, Engravers, Booksellers, Bookbinders, Printers and Publishers in New York City, 1821–42* (1993); and editions of sources for printing and publishing history: Warren S. Tryon and William Charvat, eds., *The Cost Books of Ticknor and Fields* (1949), and K. I. D. Maslen and John Lancaster, eds., *The Bowyer Ledgers: The Printing Accounts of William Bowyer Father and Son Reproduced on Microfiche, with a Checklist of Bowyer Printing 1699–1977* (published jointly with the Bibliographical Society, London, 1991). Recent contributions have included titles as varied as: Kenneth E. Carpenter, *The Dissemination of "The Wealth of Nations" in French and in France 1776–1843* (2002); Brian Alderson and Felix de Marez Oyens, *Be Merry and Wise: Origins of Children's Book Publishing in England 1650–1850* (copublished with the Pierpont Morgan Library and the British Library, 2006); Milton McC. Gatch, *The Library of Leander van Ess and the Earliest American Collections of Reformation Pamphlets* (2007); and Andrea Krupp, *Bookcloth in England and America, 1823–50* (2008).

Electronic Publications

Since 2003, the Society has maintained Bibsite, a portion of its Web site that "functions as a service to bibliographers by offering a means for scholars to provide public access to accumulated bibliographical research material that may be useful to other researchers."^[7] Materials posted include supplements to published bibliographies, as well as tables of statistics, databases of images, and bibliographical listings deemed more suitable for online than for print publication. In other areas of electronic publication, the BSA has made the full text of the *Papers* available through ProQuest and is exploring the possibility of reissuing its back list of monographs as e-books.

From the date of its founding, the BSA's reason for existence has been to promote bibliographical research and to issue bibliographical publications. The Society has never promulgated a definition of bibliography, nor attempted to choose among the several applications of that term. Rather, the topics of research encouraged by the BSA and represented in its publications have included examples of every kind of bibliographical activity, as well as studies that build on bibliographical evidence to explore the context, whether literary or historical, in which books were produced and used. It expects to continue to promote, in whatever medium, work that will demonstrate the value of material evidence for the study of books and book history.

Emeritus, Graduate School of Library and Information Science, University of Illinois at Urbana-Champaign, Champaign, Illinois, U.S.A.

Abstract

The basic families of bibliography are distinguished, followed by an overview of the history of bibliography. Major works in the world of bibliography are cited in their contexts. The practices of assembling and searching bibliographical lists are summarized, and the last section, which focuses on physical bibliography, surveys the study of books as artifactual evidence.

BIBLIOGRAPHY IN GENERAL

Bibliography cites and studies books. The citing and compiling of citations into lists (i.e., bibliographies) are *reference* (or *enumerative*, or *systematic*) bibliography, the studies of printed artifacts are *physical* bibliography. The two activities go together.

Books, narrowly defined, are monographs printed on paper. There are millions of them, their numbers are growing, and they are much used. Books may also be defined broadly, to include other forms of written records: pamphlets, journals and their contents, maps, music, manuscripts, pictures, recordings, movies, texts of all kinds, tangible objects, online, or conceptual. Books are physical objects that exist because of their ideas. They are content as well as form, messages as well as media. The content can significantly determine the makeup and appearance of the object that readers are aware of. In turn, the object affects the way readers view the content. Bibliography deals with the content by citing and studying the physical sources. By specifying the physical evidence it locates the content; by suggesting the context of the evidence it reflects on the authority of the content.

Bibliography addresses the needs of readers by describing and prescribing. (Patrick Wilson's *Two Kinds of Power* explores the distinction.) Readers, however, still enjoy the freedom to use the citations as they please, selecting what they want, ignoring what they think they do not need, and reading into their selections whatever they wish. Bibliographical work is still validated by responsible citation and study of the written record, as informed by respect for readers and their intellectual freedom. The written record is implicitly historical: it deals with writings that now exist; it is also political in that it is designed for future use by readers.

Bibliographical citations are also transmitted informally and implicitly. They are passed on orally: indeed, personal communication is probably the most powerful but also the least controllable and measurable medium of

bibliography. The bedrock, however, is the citation, on paper or online, ideally formulated to be concise but sufficient, and based in physical evidence.

THE HISTORY OF BIBLIOGRAPHY

The Origins of Bibliography

The story of bibliography begins not in the West with Gutenberg's invention of printing around 1450. From the ancient Near East, three millennia earlier, archival inventories survive on cuneiform tablets. Early Egyptian lists are known about as well. The first famous bibliography is the *Pinakes* ("tablets"), conceived in the fourth century B.C.E. at the great library at Alexandria, which may have included the library of Aristotle, the mentor of Alexander the Great. Its contents were thought of less as an archive than as literature, and thus they were organized by the names of authors. The tablets disappeared when the library was destroyed, but later sources testify to their use for over a millennium as references to the known and lost writings of classical civilization.

Other bibliographies served other purposes. The Greek physician Galen (A.D. 129–199) prepared a list of his authentic works to help distinguish them from other works falsely attributed to him. In his *Retractiones* (A.D. 427), an aging St. Augustine cited his earlier writings in order to revisit them. The Venerable Bede concludes his ecclesiastical history (ca. 734) with a list of several dozen brief titles of his sources, beginning with books of the Bible, and ending with his other writings. In the book world around 985, probably in Baghdad, Muhammad ibn Abi Ya'qub Ishaq al-Nadim prepared a vast index, the *Fihrist al-'Ulum*, and cites writings that can often be traced back to the *Pinakes*.

One landmark above all was to affect all later bibliographical practice: St. Jerome's bio-bibliography (ca. 392) of writings by 135 authors, mostly Church Fathers, now

known as *De viris illustribus*. Jerome's goal was to justify his choice of sources so as to argue for the authority of his "Vulgate" Bible. His list, and its two notable supplements, by Gennadius of Marseilles, ca. 490, with 91 added names, and Isidore of Seville, ca. 620, with 33 more, were to inform Biblical exegesis over the following centuries. Several earlier bibliographical sources, like the *Pinakes*, were also author lists, but with Jerome the names of the authors invited readers to honor their names by critically evaluating their work.

Newly founded libraries often listed their holdings, which grew from a dozen or so volumes in the early Christian era to hundreds in the late middle ages. Citation practices were casual, and bibliography, inventory, and catalog were the same. In fact, the holdings were usually better recorded in the memories of readers. A famous catalog-poem of Alcuin (ca. 735–804), for instance, recites the holdings of his library at York in a mnemonic sequence that identifies the relative location of volumes on the shelf. From the fifteenth century also come several union lists of the manuscripts in Dutch and English libraries. The latter are valuable evidence of early holdings that predate the confiscations of Henry VIII.

The Rise of Modern Bibliography

The spread of printing after 1450 introduces a modern era in bibliography. If books were to circulate and flourish commercially, more was needed than word-of-mouth promotion. As the output of the press grew, the bibliographical record expanded, both in numbers and in kinds, for use by readers and purchasers, authors and printers, merchants and rulers. The lists generally fall into four bibliographical genres: commercial booktrade lists (booktrade bibliographies, publishers' and booksellers' catalogs), topical lists (subject bibliographies), advisory lists (bibliographies of prohibited or recommended writings, whether of political, religious, or social grounds), and catalogs of collections. The four categories overlap, perhaps not always in the minds of their original compilers or in the special interests of their sponsors, but as they were used in their day and over the course of history.

Commercial Lists: The very first printed list (ca. 1469) was a broadside issued by Peter Schoeffer, Gutenberg's successor, who sensed the value of listing the titles he had printed. As the book trade emerged, titles were promoted through catalogs. Beginning in 1564, citations of the titles from many publishers, exhibited at the semi-annual Easter and Michémas book fairs in Leipzig and Frankfurt, were collected and issued in lists known as *Messkataloge*. In time, these trade lists were to expand to become current national bibliographies of German books. The *Messkataloge* were succeeded by several extensive periodical lists: Wilhelm Heinsius's *Allgemeines Bücher-Lexikon* (1812–1894), Christian Gottlob Kayser's *Vollständiges Bücher-Lexikon* (1834–1912), *Hinrichs'*

Katalog (1857–1913), and others leading up to today's *Deutsche Nationalbibliographie* (begun 1921).

Trade lists were needed because the German book trade, like the country itself, was decentralized: publishers needed to share their markets. In other countries, where the trade was centered in one city (like Paris or London), current lists emerged later, but still on the initiative of the booktrade. Most lists were not so much national as cultural resources: in a time when Latin was giving way to local vernaculars, the language of potential purchasers was primary. The Netherlands book trade lists (Johannes van Abkoude's *Naamregister van de bekendste en meest ongebruik zynde Nederduitsche boeken*, begun in 1788, later replaced *Brinkman's Cumulative catalogus van boeken*) have enjoyed an especially long life. In Great Britain, no continuing lists date from the eighteenth century. Only in the mid-nineteenth were two competing firms to emerge to share the market: Samson & Low (*Publisher's Circular and Publisher and Bookseller*, begun in 1837) and Whitaker (*The Bookseller and Current Literature*, begun in 1858). The Norwegian *Norsk bogfortegnelse* dates from 1848, the Danish *Dansk bogfortegnelse* from 1851, the Swedish *Svensk bokhandels-tidning* from 1863. For the Russian booktrade, the St. Petersburg firm of A. F. Bazunov prepared a *Sistematicheskii katalog* beginning in 1869. A *Bibliographie de Belgique* was begun in 1875, with extensive overlap with the Brinkman lists from the Netherlands, since Flemish publishers in both countries shared their market. In the United States, the major early trade lists were the work of Orville A. Roorbach (*Bibliotheca americana*, 1852–1861) and James Kelly (*American Catalogue of Books*, 1866–1871). A continuing succession of American trade lists began with Frederick Leypoldt (later R.R. Bowker; *American Catalogue of Books*, begun 1876) and H.W. Wilson (*United States Catalog; with Cumulative Book Index*, begun 1898).

Over time, governments replaced the booktrade in sponsoring the national bibliography. The readership was now a civil polity rather than the booktrade's customers. The most famous example was the *Bibliographie de la France* (begun in 1811), long encumbered by the arbitrary decisions of functioning bureaucracies. Booksellers and readers thus often preferred booktrade lists like Otto Lorenz's *Catalogue général de la librairie française* (1867–1945), or later lists known as *Biblio* (now subsumed in a separate section of the *Bibliographie nationale française*). Other governments assumed responsibility for listings their country's publishing output, if often selectively. The most spectacular saga of a national bibliography is that of the Russian *Knizhnaia Letopis'*, begun in 1907 and issued continuously with few delays through a century of revolutions, invasions, and other tortuous events.

Topical Lists: Other early printed subject bibliographies cover medicine (Symphorien Champier's *Index*, 1506), law (Giovanni Nevizzano's *Inventarium*, 1522),

botany (Otto Brunfels' *Herbarum*, 1530), and many other subjects. These are landmarks in the history of the disciplines, but mostly for the intellectually curious. They deal with concepts and theories; the skills were to be learned not by reading books but through instruction and apprenticeship under master practitioners. The age of modern subject bibliography began with eighteenth century academic scholarship.

The most common subject lists were the early bibliographical *Acta*, lists in the spirit of St. Jerome that record the good deeds, not of the apostles of the church but of the apostles of learning, but still for critical study and veneration. The order was by authors' names, listed alphabetically or occasionally chronologically, rather than by subject subdivisions. Notable early lists are devoted to religious orders, beginning with Johannes Trithemius's *Carmelitiana bibliotheca* (1493). Later major works include Lucas Wadding's Franciscan *Scriptores ordinis minorvm* (1650) and Jacques Quétif's Dominican *Scriptores ordinis praedicatorum recensiti* (1719–1721), each of them later revised. The greatest of the genre is Augustin and Alois de Backer's vast *Bibliothèque des écrivains de la Compagnie de Jésus* (1835–1861, later revised by Carlos Sommervogel), still used to locate the early writings on the expansion of European settlement around the world from the vantage of the Jesuit missionaries who worked to convert the indigenous populations to Christianity.

Several early *Acta* celebrate the emerging national literatures. The compilers defined the criteria for inclusion; here again, the dividing lines were linguistic more often than political, since many national boundaries were not yet fixed. John Bale's *Illustrium maioris Britanniae scriptorum* (1548), for instance, follows a chronology that begins with the Biblical Seth (!) and ends up with Bale himself. Italian literature is covered in *La libreria* (1550) and *La seconda libreria* (1551), by Anton Francesco Doni, with the brief entries and quirky coverage that one would expect of this famously erratic poet. French bibliography begins with the *Premier volume de la Bibliothèque* of François Grudé de la Croix du Maine (1584) and its competitor, *La Bibliothèque* of Antoine du Verdier (1585). Each has titles the other missed. Other early *Acta* celebrate the hero-authors of regions and cities, among them Michele Poccianti's *Catalogvs scriptorum florentinorum* (1589) for Florence, Leone Allacci's *Apes Vrbanae* for Rome (1633), Louis Jacob de St. Charles' *Bibliographia Parisina* (1643, complemented by a *Bibliographia gallica*, 1651, for the rest of France), and for Oxford, Anthony à Wood's *Athenae Oxoniensis* (1691–92ff.).

Bibliographies before the nineteenth century were rarely devoted to individual authors, the famous exception being Erasmus's autobibliography at the end of his 1523 *Lucubrationum*, a forerunner of the lists that academics today prepare in applying for grants and promotion.

Lists of Recommended and Forbidden Books: The flood of printing in general, but Reformation and later the

Counter-Reformation religious tracts in particular, called for bibliographies of opposite kinds. Books recommended for the faithful have their model in the *Bibliotheca selecta* (1574) of the learned Jesuit Antonio Possevino (1534–1611). Faithful readers are not always easy to separate from eager or busy readers, whose needs were served by a vast array of recommended books, advisory and critical reading lists, and bibliographical "epitomes." The genre merges with prose works like Helen Haines *Living with Books* (1935 and 1950), long a mainstay of library school classes in book selection. All such works beg the criteria for inclusion and exclusion and ultimately the cause of intellectual freedom: readers are grateful for guidance, but they need to ask where it is coming from. The classic framing of the problem is in Lester Asheim's two famous essays, "Not Censorship but Selection," *Wilson Library Bulletin*, 28 (1953), 63–67, and "Selection and Censorship: A Re-appraisal," *Wilson Library Bulletin*, 58 (1983), 180–184.

More famous are the bibliographies of the opposite kind: ones that ban books. The famous example is the *Index librorum prohibitorum* of the Roman Catholic Church, begun in 1564, as fearful in its consequences as it was absurd in its execution. The set went through many editions before it was finally abolished in 1966. Listing the forbidden fruit in bibliographical citations was not a wise decision: forbidden fruit is always tastier. Political censors, in contrast, rarely publicized the apostates, preferring instead to destroy the copies and often their authors. This has left modern bibliographers with the hunt for Marprelate tracts and Mazarinades, pamphlets of the English Civil War and the American and French Revolution, booklets, diatribes, and broadsides, all of it crucial historical evidence for the study of the intellectual roots of political, social, and cultural change. The bibliography of pornography is still different. Sexually explicit material had been collected avidly, less by institutions than by a small and secretive world of private collectors, in which written citations are often privileged; and tastes in erotica have often been subjectively redefined. The genres of literature suppressed on sexual, social, political, and religious grounds is surveyed in the *Banned Books* series (1998; new eds., 2006).

Library Catalogs: The genre begins with the *Catalogus Graecorum librorum* (1575), covering 126 Greek manuscripts in the city library of Augsburg. The manuscripts had been presented to the city by the patrician Johann Jakob Fugger, and Hieronymus Wolf, his librarian, had prepared this catalog. A difference between public and private libraries then was irrelevant. Other notable early library catalogs include the *Ecloga Oxonio-Cantabrigiensis* (1600), a union list of the manuscripts in Oxford and Cambridge libraries compiled by Thomas James, who also prepared the first catalog of the Bodleian library (1605). In the third Bodleian catalog (1674), the librarian, Thomas Hyde, first suggested the need for consistency, anticipating the need for cataloging codes.

Over the nineteenth and twentieth centuries, many libraries published catalogs of their holdings. Among the great early American catalogs were those of the Astor Library in New York (1886–1888), and Charles Ammi Cutter's for the Boston Athenaeum (1874–1882). Also much respected are the catalogs of the two greatest libraries of Europe, the Bibliothèque Nationale in Paris (*Catalogue général*, 1900–1981), and the British Museum in London (1900–1905 and earlier, 1931–1954, and 1968–1979, superseded by the *British Library General Catalogue of Printed Books to 1975*, 1979–1987). The Library of Congress complemented them with its *Catalog of Books Represented by . . . Printed Cards* (1942–1946).

Universal Bibliography: The dream of one single bibliography, vast, comprehensive, and sufficient, is timeless. The first printed bibliography, Johann Trithemius's *Liber de scriptoribus ecclesiasticis* (1494), actually covers more than the writings of ecclesiastics: it nobly assumes nothing less than that all writings are the work of God, a vision of the wondrous totality of the intellectual universe. In truth, Trithemius's work is based mostly on the books in his monastery library at Sponheim. His work is still modest alongside Conrad Gessner's *Bibliotheca universalis* (1545–1555). Trithemius (1452–1516) was a learned scholar who looked inward (his best known other work is in cryptography), Gessner (1516–1565) was a brilliant polymath who looked outward to new fields involving the world at large, from natural history and geology to linguistics (in all of which fields he was historically important). Gessner's curiosity led him to end his work with a fourth volume, the famous "pandects," which provided subject access to the earlier volumes. Inevitably, his successors were lesser minds, who created selective abridgements of his work with shortened citations. Among Gessner's ambitious but sad successors is Francesco Marucelli (1625–1703), who copied out 111 volumes of citations to create his *Mare magnum*, a great bibliographical ocean still preserved but largely inaccessible in his Bibliotheca Marucelliana in Florence. Several other works have a national spin in their titles, although their purpose was not to record the nation's publications but to cite writings that were part of the national heritage, published anywhere: Christophorus Hendreich's *Pandectae Brandenburgicae* (1699; only A–B were completed) and Robert Watt's *Bibliotheca Britannica* (1824) come to mind. In the twentieth century, the world visions have been revived and begun to be implemented in the name of Universal Bibliographical Control.

Three Later Developments

Over the course of the nineteenth century, three innovations were to alter the world of bibliography profoundly: cataloging codes for libraries, serial lists of current writings, and the formal study of books as physical objects. All had precedents in earlier periods. All were justified by

emerging readerships in the new democratic societies; by a burgeoning book production made possible because of the readers as well as the Industrial Revolution; and by a proliferation of subject specialties that resulted from and in turn fostered to the new agenda of academic scholarship.

Library Cataloging Codes: (See *Cataloging*.) As libraries were established—in particular the publicly financed ones beginning in the nineteenth century, where costs needed to be measured—rules and uniform citation practices began to be developed. The goal was to provide for sharing bibliographical citation practices, and in time citations themselves, based on practices of compiling lists. Compilers of bibliographies were in turn influenced by cataloging codes, whose citations were easy to adapt and whose arbitrary practices saved the compilers many decisions.

The difference between cataloging and bibliography has been often proposed and continuously redefined over the years, and a firm relationship probably should not be fixed. The two obviously have much in common, not only in the material they describe but often also in the ways they describe it. They are still different in their objectives. Cataloging describes copies for all readers, bibliographies cover delimited literatures, and serve the needs of identified audiences of readers. Many writings have long fallen outside the scope of cataloging practices—periodical articles and many other analytics among them—and often particular communities of readers make best use of citations formulated with the familiar terms they use and in the structures they know. Ideally, cataloging data are based on autopsy of copies, but the content is frequently verified in bibliographies. Bibliographers too are expected to have examined the copies they cite, but today they are greatly helped by the way catalogs provide not only locations but also citations to adapt.

Serial Bibliographies of New Writings: Scholarly journals arose with the learned societies of the late seventeenth century, along with a few short-lived bibliographies. The *Acta* were still sufficient, especially with supplements. One of the most famous of them, Christian Gottlieb Jöcher's *Allgemeines Gelehrten-Lexikon* (1750–1751), for instance, had a supplement as late as 1897. A changing academia led to lists like Jeremias Reuss's *Repertorium commentationum a societatibus litterariis editarum* (1801–1821). Periodicals of all kinds called for indexing, but the indexes were particularly important to the proliferating fields of scholarship. Slowly the biographical focus gives way to subject classification, in the interests of providing a current awareness service to the growing scientific communities. Detailed indexes were needed in fields that were evolving, and occasional annotation of the entries in time led to today's abstracting services.

Periodical indexes for general libraries began with William F. Poole's *Index to Periodical Literature* (1853, new ed., 1891 with suppl. to 1907). In 1905, H.W. Wilson

began his indexes, beginning with the *Readers' Guide to Periodical Literature* (1905). The largest foreign counterpart is the *Bibliographie der deutschen Zeitschriften-literatur* (1896–1964) and counterpart *Bibliographie der fremdsprachigen Zeitschriften-literatur* (1911–1994),

Physical Bibliography: The study of books as physical objects has its roots in the work of the early printers and book craftsmen, who asked how they could make their books more attractive and easier to produce. Discerning collectors, antiquarian dealers, librarians, and inquisitive readers in time came to ask the same questions, particularly over the course of the nineteenth century. A crucial figure was the Cambridge University librarian Henry Bradshaw (1831–1886), who proposed a “natural history method” for studying the changing output of the early printers and rationalized the collational formulas that are the basis of descriptive bibliography. The founding of bibliographical societies around the turn of the century served to establish the new field, thanks in part to their journals and other publications. [See Bibliographical Society (London); Bibliographical Society of America. Their scholarship is discussed in the Section “Physical Bibliography”.]

THE WORLD OF BIBLIOGRAPHIES

Today's wealth of enumerative bibliographies ranges separate monographs in book form, often in multivolume sets, to pamphlets, articles, and handouts. Many lists are also now being posted online, where they can be easily updated, but also silently reconceived, renamed, or even deleted.

National Imprint Bibliographies: Retrospective

Most retrospective lists are censuses of known copies, but a few cite unrecorded the titles of works now lost. The bibliographies fit along an axis of place (whether defined by geographical borders, by language, or by the effective market for the book trade) and time (from the earliest imprints to the present). The genres and their contexts are detailed in Friedrich Domay's *Bibliographie der nationalen Bibliographien* (1987).

United States: Annals for the Colonial and early Federal years are recorded in Charles Evans's *American Bibliography* (1903–1959) and extended by Ralph R. Shaw and Richard H. Shoemaker in *American Bibliography* (1958–1963) and the *Checklist of American Imprints*, so far through 1846 (1964). The online *North American Imprints Project* will subsume the extant entries, minus Evans' chronicle of the press. The *Bibliography of American Imprints to 1901* (1993) is particularly strong for the early years, thanks to recent cataloging at the American Antiquarian Society.

Great Britain: The landmarks are the *Short-Title Catalogue... 1475–1640* (1926; 2nd Ed., 1976–1991, commonly called either “STC” or “Pollard and Redgrave,” for the guiding spirits behind the 1926 Ed.), and Donald M. Wing's *Short-Title Catalogue of Books... 1641–1700* (1945–1951; 2nd Ed., 1972–1998). These are now incorporated into the online *English Short-Title Catalogue*, which also subsumes the *Eighteenth Century Short Title Catalogue*, an ambitious online descriptive bibliography project. *The Nineteenth Century Short-Title Catalogue* (1984), in contrast, covers a considerably larger literature mostly by merging the card catalogs of several major British scholarly libraries. For the general literature of the later years and up to the highly selective *British National Bibliography* in 1950, booktrade lists are needed, along with the British Museum and other library catalogs. For regional writings, Harry G. Aldis's *List of Books printed in Scotland before 1700* (1916 and 1970) has brief citations, while Eiluned Rees's *Librae Walliae* (1987) cites Welsh books, 1546–1820, in fine detail.

Romance-Language Nations: No single French list covers the years before the *Bibliographie de la France* (1811) and its booktrade counterparts. Probably the most useful is still Alexandre Cioranescu's *Bibliographie de la littérature française du 16. [17 and 18.] siècle* (1959–1969). Italy similarly has no single sources, although the sixteenth century is being covered by the online “EDIT16” (*Censimento nazionale delle edizioni italiane del XVI secolo*), while the nineteenth is the basis for *CLIO: Catalogo dei libri italiani dell'Ottocento* (1991). For these and other areas, the British Museum—long seen as having the world's second-best collection of everything—prepared short-title catalogs for its holdings. That for France, 1470–1600, was the work of Henry Thomas (1924 and 1986), that for Italy the work of A.F. Johnson and others (1958), extended in Dennis E. Rhodes's *Short-Title Catalogue of Seventeenth-Century Italian Books* (1986).

Sketchy book-trade bibliographies cover Spain and Portugal, often their New World colonies. The basic historical work is Antonio Palau y Dulcet's vast and conspicuously stenographic *Manual del librero hispano-americano* (1948–1977). The heroic bibliographer of Latin America is José Toribio Medina. His *Biblioteca hispano-americana* (1898–1907) is useful, but the most impressive of his many works is the eight volume *La Imprenta in Mexico, 1539–1821* (1908–1912; the first volume, based on work by Joaquín García Icazbalceta, revised 1954, 1981). Medina also compiled lists for many other countries. His work is complemented by the work of other historical bibliographers, notably covering Cuba (Carlos Manuel Trelles y Govín, 1902–1926) and Haiti (Max Bissainthe, 1951 and 1973). There are also British Museum short-title catalogs by Henry Thomas, of Spanish (1921), and Portuguese books (1926) with a 2nd Ed., by Dennis E. Rhodes (1989, some with revised editions).

Germany and Adjacent Areas: The Leipzig and Frankfurt booktrade lists extended to cover much of the output of the German-speaking world, i.e., Austria, parts of Switzerland and of what now are many other central European nations. The two enormous "GV" sets (*Gesamtverzeichnis der deutschsprachigen Schrifttums, 1700–1910* and *1911–1965*) interfile the entries from the earlier lists of Heinsius, Kayser, Hinrichs, their successors, and supplements. The earlier periods are covered in the "VD" series: the *Verzeichnis der im deutschen Sprachbereich erschienenen Drucke des XVI. Jahrhunderts* (1983) and the online *Verzeichnis... des XVII. Jahrhunderts*. A.F. Johnson listed the British Museum's German books, 1455–1600 (1962); David A. Paisey prepared a supplement (1990), and a list for the years 1601–1700 (1994).

For the Low Countries, Wouter Nijhoff & M.E. Kronenberg's *Nederlandsche bibliographie* (1923–1961) covers the years 1500–1540. Later holdings in Belgian libraries are listed in Elly Cockx-Indestège and Geneviève Glorieux, *Belgica typographica, 1541–1600* (1968). A.F. Johnson and Victor Scholderer prepared a British Museum *Short-Title Catalogue of Books Printed in the Netherlands and of Dutch and Flemish Books Printed in Other Countries from 1470 to 1600* (1965), which was extended to 1620 by Anna E. C. Simoni (1990).

For Swedish imprints, Isak Collijn's *Sveriges bibliografi* covers the years to 1600 (1927–1938) and later (1942–1946), which Rolf du Rietz is extending in *Swedish Imprints, 1731–1833* (1977). For Denmark, Christian Walther Bruun's *Bibliotheca danica, 1482 til 1830* (1877–1931), was extended to cover the years 1831–1840 by H. Ehrencron-Müller (1943–1948). For Norway, Hjalmar Pettersen's *Bibliotheca norvegica* (1899–1924) covers the years 1643–1813.

Other Nations: The most heroic saga in all of bibliography is probably that of several generations of the family of Estreicher, librarians at the Jagiellonska Library in Krakow, who since 1872 have been compiling the *Bibliografia polska*, covering imprints up to 1900. Other notable lists from Eastern Europe include the lovely but uncompleted Czech *Knihopis českých a slovenských tisku* (1925–1948); Ioan Bianu's *Bibliografia romaneasca veche 1508–1830* (1903–1936); and the online Hungarian *Magyar Nemzeti Bibliográfia* data bases, covering early imprints from what is now Hungary as well as early editions in the Hungarian language printed elsewhere.

Other notable retrospective national lists include John A. Ferguson's *Bibliography of Australia, 1784–1900* (1941–1969), Austin Bagnall's *New Zealand National Bibliography to the Year 1960* (1970), Sidney Mendelssohn's older *South African Bibliography* (1910), and Marie Tremaine's *Bibliography of Canadian Imprints, 1751–1800* (1952, with a supplement by Sandra Alston and Patricia Lockhard Fleming, 1999), as well as Fleming's superb *Upper Canada Imprints, 1801–1820* (1988) and *Atlantic Canadian Imprints, 1801–1840* (both 1991).

National Imprint Bibliographies: Current

Ideally these should extend the retrospective lists. Usually, however, there are chronological gaps and different criteria for inclusion, the exception being the *Bibliographie Nationale Française*, a direct successor to the *Bibliographie de la France*. The *British National Bibliography* (begun 1950), one of the most successful recent national bibliographies, was a totally new project. It was the model for *Canadiana* (also begun 1950), the *Australian National Bibliography* (begun 1961), and the *New Zealand National Bibliography* (begun 1967)—all government supported. In Germany, the *Deutsche Nationalbibliographie* was established in Leipzig in 1921 as successor to national and trade lists that date back to the *Messkataloge*, but with many changes. During the Iron Curtain era, a *Deutsche Bibliographie* was issued out of Frankfurt in the West. National reunification led to a *Deutsche Nationalbibliographie* based on cooperative efforts.

The mid-twentieth century also saw official national bibliographies set up in Eastern Europe, serving the cause of ideological control along with the promotion of books and reading. The quality varied from the barely competent to the superb. It is not clear how much these lists are being weakened by a less rigid enforcement of copyright deposit laws now that publishing is no longer managed by the state. In most Third World countries, current national bibliographies have been meager, fostered, and sustained mostly by a weak local book trade working with a national library and with encouragement from UNESCO and friends abroad. For several decades beginning in the 1960s, the American Libraries Book Procurement Center at the Library of Congress managed a program for acquisitions of books from countries with counterpart currencies (PL-480), and cataloging them in an *Accessions List* series. Several countries with well developed booktrades have strong national bibliographies that use their national scripts, the Japanese *Nihon Zenkoku shoshi* being a good example. Recent titles are cited in Barbara L. Bell's *Annotated Guide to Current National Bibliographies* (1998). For the latest developments, the invaluable sources now are the *Reference Resources Europe* works maintained by the Italian publisher Casalini, annually in print (RREA, 1995) and online (RREO).

The United States has no national bibliography, aside from the Bowker and Wilson trade lists. It is generally assumed that there is very little of importance that is not in today's online union catalogues. New registrations at the Copyright Office in the Library of Congress have been listed in print since 1891. The data are often useful in bibliographical work, but the *Catalog of Copyright Entries* is often not well organized for use and hard to call a national bibliography. In 1948, the Bowker Co. began issuing *Books in Print* (a French counterpart, *Les Livres disponibles*, began in 1977, the German *Verzeichnis lieferbarer Bücher* in 1978), now accessible online.

Current Online Subject Bibliographies

Vast in their size and timely in their service to research, most current subject bibliographies are now online. (See the entry on “Online Database and Information Retrieval Services Industry,” p. 3963.) Constructed not as a sequence of entries (alphabetic, chronological, or classified) with indexes, the online sources are accessible through search terms, such as can be regularly updated to reflect new concepts and relationships. Some lists give entries only, others include abstracts. Many of the most respected of them grew out of sources that began in print, among them the MEDLINE/PubMed database (successor to the *Index medicus*, begun in 1879), WilsonWeb Library (incorporating many of the H.W. Wilson Co. library lists, including the *Readers Guide to Periodical Literature* (begun in 1905), *Chemical Abstracts* (begun in 1907), the Modern Language Association’s *Annual Bibliography* (growing out of the *American Bibliography*, begun in 1921), *Biological Abstracts* (begun in 1926), and the *International Bibliography of the Social Sciences* (begun in 1951).

The proliferating world of online bibliography is expanding in many imaginative directions. Services like *The Web of Science* (begun in 1961 as the *Science Citation Index*, later expanded to cover writings in the social sciences, arts, and humanities) document the spread of learning in footnotes and references. Vendors often produce several services, some of which they have taken over from earlier printed sources, others of which they have originated. *America: History and Life* has *Historical Abstracts* as a counterpart; in Lexis/Nexis, the former focuses on legal research, the latter on the news media. Some provide full texts, which still require bibliographical entries for access, others are built around search-term access in ways that imply that bibliographical authority is irrelevant.

Printed bibliographies have been either subsidized or justified by likely purchasers. Most current online subject bibliographies are rather different: as commercial businesses, they need to follow different economic rules as they negotiate operational decisions that will reconcile the demands of investors with the needs of their identified readers.

Other Bibliographies

Countless other lists cover narrowly defined subject areas, whose readers come to know their strengths and weaknesses. The bibliographies describe the literatures of subject areas large and small, of academic disciplines, and of topics within and between the disciplines and subject areas, as qualified by historical periods, geographical areas, and perspectives. They serve readers at all levels, from children and amateurs to specialized scholars, and they include citations in many languages. Often their

entries are classified in categories that reflect the structures of their readers’ fields of interest, annotations address the specific agenda of the discipline. Lists often include periodical articles and sections of larger works, chapters of books, essays in anthologies, poems and songs in collections, or individual maps in atlases—what bibliographers call “analytics” and which are outside the purview of library cataloging. Their scope is limited to the written record as it exists when the list is being compiled: future titles need to go into a supplement or a later edition. Many lists are now published online, although the linear layout is still usually that of the printed page. Among the printed and online genres are the following:

Bibliographical Guides: Bibliographies of bibliographies—lists that cite the lists that cite the sources—are of limited but occasional usefulness. The most extensive, now four decades old, is Theodore Besterman’s *World Bibliography of Bibliographies* (4th Ed., 1965–1966). It cites over 100,000 titles, out of a likely several million today. It is limited to lists published separately (in other words, bibliographies at the end of or as parts of other works are excluded). It can be very useful, particularly for its juxtapositions of lists that cover the same general topic but also for its totals of the number of entries cited in each list; but there is general consensus that bibliographies of bibliography are rarely a first place to look. Besterman himself devised his subject headings. They usually work, occasionally they are idiosyncratic, even counterintuitive. Alice E. Toomey’s supplement, *A World Bibliography of Bibliographies, 1964–1974: A List of Works Represented by Library of Congress Printed Catalog Cards* (1977), is arranged under Library of Congress subject headings, which are often no less counterintuitive. Besterman’s precursors are discussed in Archer Taylor’s *A History of Bibliographies of Bibliography* (1955). One step beyond such lists is Aksel G.S. Josephson’s *Bibliographies of Bibliographies Chronologically Arranged* (1901, with supplements to 1913). No successor to any of these works has ever appeared. Considering the magnitude of the task—the complexity of the genres, the sheer number of titles—the prospects of successors seem slim.

Bibliographical guidance is often easier to dig out of selective guides to reference sources. Most notably of these has been in the United States the *Guide to Reference Books* (11 eds., 1902–1996), long the work of a notable lineage of American reference librarians: Alice Bertha Kroeger, Isadore Gilbert Mudge, Constance Winchell, Eugene Sheehy, and Robert Balay. Their successor, the *Guide to Reference*, was recently published by the ALA in a Web-based version. Foreign counterparts include, for Great Britain, A.J. Walford’s *Guide to Reference Material* (1959; new eds, under different titles); for Germany, either Georg Schneider’s *Handbuch der Bibliographie* (1923; latest ed., 2005) or Wilhelm Totok and Rolf Weitzel, *Handbuch der bibliographischen Nachschlagewerke* (1954 and later eds.); and for France, Louise-Noëlle

Malclès's ancient but venerated *Les sources du travail bibliographique* (1950–1958). A selection of the most important new reference sources, many bibliographies among them, appears annually in *College and Research Libraries*, as well as in reviewing media like the *American Reference Books Annual* (1970, and as *ARBA online*); also in the H.W. Wilson *Bibliographical Index* (1937, now online at *Bibliographical Index Plus*).

Subject Lists, Monographic, and Analytic: These range from brief check-lists, often of ephemeral interest—their very existence is often best known by informal communication among specialists—over to monuments of scholarship like the multivolume Clarendon Press *Bibliography of British History* (1928–1970), the *New Cambridge Bibliography of English Literature* (1969–1977), along with T.H. Howard-Hill's *British Literary Bibliography* series (1966)—to single out a few major works. Several smaller lists serve also as basic guides to specialist reference librarians and as textbooks in historical methods courses for graduate students. Notable examples include the *Harvard Guide to American History* (Oscar Handlin, later Frank Freidel; 1954 and later eds.), and Vincent Duckles's *Music Reference and Research Materials* (1964, based on early syllabi, 1948–1957; 5th Ed., 1997). Monroe Nathan Work's *Bibliography of the Negro in America and Africa* (1928), maps out a literature that supports a richly expanding field of scholarship.

Among scholarly descriptive bibliographies, two landmarks are devoted to literary genres: W.W. Greg's *Bibliography of the English Printed Drama to the Restoration* (1939–1959) and David F. Foxon's *English Verse, 1901–1750* (1975). The output of historically significant presses is cited and discussed by Horace Hart (Oxford University Press, 1900, extended by Harry Carter, 1975), Philip Gaskell (John Baskerville, 1959; the Foulis Press, 1964), D. F. McKenzie (the early Cambridge Press, 1966), C. William Miller (Benjamin Franklin, 1974), William S. Peterson (Kelmscott Press, 1984), and Marcella Genz (Eragny Press, 2004).

Bio-Bibliography: Collected bio-bibliographies no longer predominate as in the days of the *Acta*, although several are still today among the mainstays of the bibliographical reference shelf. Many of the most respected of them cover national literatures. One thinks of Karl Goedeke's *Grundriss zur Geschichte der deutschen Dichtung aus den Quellen* for Germany (1859, reissued and extended; new Ed. in progress); the Maurist *Histoire littéraire de la France* (1733ff.), first of many French guides; Thomas Erslew's *Almindeligt forfatter-lexikon* (1843–1853) for Denmark, Jens Halvorsen's *Norsk Forfatter-Lexikon, 1814–1880* (1885–1908), succeeded by Holger Ehrencron-Müller's *Forfatterlexikon omfattende Danmark, Norge og Island indtil 1814* (1924–1935) for Norway, Bengt Ahlén's *Svenskt författarlexikon* (1942) for Sweden, and Innocencio Francisco da Silva's *Diccionario bibliografico portuguez*

(1858–1923)—the latter notable for its filing of entries by the author's *first* name (those who work extensively with Portuguese surnames will know why). Two other sets of *Acta* are mainstays of the reference shelf in fields where creativity is basic: Robert Eitner's *Quellenlexikon* (1900–1904), with citations of manuscripts printed editions of composers, and Ulrich Thieme and Felix Becker, *Allgemeine Lexikon der bildenden Künstler* (1900–1907; new Ed., 1983), for artists and their work. Appropriate to their celebratory function, most bio-bibliographies are printed; online lists have been slow to emerge.

Bibliographies devoted to one person emerged only over the last century, and are essentially of two kinds. Those devoted to writings *about* the person tend to have short entries, and are essentially of biographical interest. Writings *by* the person range from brief checklists, to superbly detailed descriptive bibliographies that are essential to textual scholarship. Among the many notable examples of the latter are those on Cotton Mather and his family (Thomas J. Holmes, 1931–1940), on Samuel Johnson (J.D. Fleeman and James McLaverty, 2000), on several eighteenth century authors by Allen Hazen, nineteenth century American authors by Joel Myerson, on twentieth century authors by Donald Gallup and Matthew J. Bruccoli, and others by William B. Todd.

Commercial Lists: Trade lists have largely been subsumed in national bibliographies, although publishers still issue lists to promote their titles. Many antiquarian booksellers now cite their offerings on the Internet, with citations are often models of descriptive bibliography and annotations (i.e., “blurbs”) of impressive historical scholarship. The laborious efforts are justified in the interests of finding customers, although scholars in general often learn to benefit from the record of the bibliographical facts and the lore behind the materials.

Library Publications: Library catalogs often function as bibliographies, even if their main goal is to organize and find items in the collection. Most library catalogs are now in union catalogs and merged on the Internet in the interest of document delivery. Most libraries also prepare finding aids (“pathfinders”) for work in the collections, selective bibliographies of a sort organized with a view to proposing search strategies for their readers. Exhibition catalogs, as they call attention to valuable or important works in the collections, often function as bibliographies. They work like dealers' catalogs in that the historical details in their annotations serve not to entice purchasers so much as to delight visitors.

Clearly, the most important of all bibliographies today are the library union catalogs. The great *National Union Catalog, pre-1956 Imprints* (1968–1980, known either as “NUC” or often for the name of its publisher, Mansell), in 685 volumes with a 69 volume supplement, grew out of the Library of Congress *Catalog of Printed Books* (1942–1946), in 167 volumes, with later supplements. It is updated but so far not entirely duplicated in the WorldCat

bibliographic database, maintained by OCLC (the Online Computer Library Center), to which over 60,000 member libraries contribute. (See the entry on “OCLC: A Worldwide Library Cooperative,” p. 3924.) Its over 88 million records cover books, serials, sound recordings, musical scores, maps, visual materials, mixed materials, and computer files. Recently, OCLC subsumed Research Library Information Network (the RLIN, maintained by the Research Library Group; not all RLIN bibliographical records are in WorldCat as of this writing, however). Online Computer Library Center also maintains close contact with the union catalogues in other countries and often records their holdings.

Incunabula: Books from Gutenberg’s day to 1501 (the “cradle” of printing) make up a much smaller but still very special bibliographical world of their own. The books are scarce, most of them large and beautiful. They testify to a world much different from ours today, so as to call for expertise of three kinds. The content is expressed either in a Latin that is usually corrupt or in vernaculars that were just beginning to be formed. The physical books call for a deep knowledge of analytical bibliography, particularly of type forms, since most printers needed to provide their own materials and adapt their skills. Finally, modern bibliographers need to know the bibliographical history, since older sources are still cited and very useful. The first major figure in this history is Georg Panzer, whose *Annales typographici* (1793–1803) are still useful for being arranged by imprint date. Ludwig Hain’s *Repertorium bibliographicum* (1826–1838) and its successors may not be held in high respect today, but scholars still consult them. More venerated is Robert Proctor, whose concept of “Proctor order” (titles are gathered first under country, then under city, then under date) is seen in the great catalog of the British Museum (begun in 1908 and finally completed in 2007). The next event was the *Gesamtkatalog der Wiegendrucke*, a unified guide begun in 1925 but still incomplete since the 1940s. Frederick Goff’s one volume *Incunabula in American Libraries* (1964) is still an indispensable starting point, although the “ISTC” project (now the *Illustrated Incunabula Short Title Catalogue*, and online now as “IISTC2”) promises to be the essential bibliographical record for incunabulists.

BIBLIOGRAPHICAL PRACTICE

Compiling Bibliographies

Enumerative bibliography involves *compilers* preparing *lists*, which contain *citations* (consisting of *entries* and, often, *annotations*) of written material, for the use of *readers*. Enumerative bibliography succeeds when the lists work the other way around: readers search the lists and find the citations. Readers are the unpredictable factor: they

often find what they need in unexpected places and they use it in ways that can rarely be anticipated.

A bibliography, as W. W. Greg proposed and Theodore Besterman famously recalled, must be based on “some guiding principle.” A transcript of citations becomes a bibliography when the principle becomes legitimized through use, although compilers commonly explain their decisions in their introduction. Admittedly, readers rarely read introductions: they impatiently turn instead to the citations. The introductions thus serve mostly to fix the list in the context of the literature. Rules for compilers follow conventions that are rarely specified but are widely understood and justified through use. The basic decisions involve:

Scope: Compilers make their topics manageable by defining their scope. All bibliographies include or exclude titles on grounds determined by the physical object or the intellectual content of the material being described. The obvious physical distinction separates books from other forms of recorded knowledge. Some forms are closely akin to books—pamphlets, government documents, and ephemera come to mind—and in lists usually fit comfortably alongside books. Continuations—serials, periodicals, journals, newspapers—usually work like books and rarely pose problems, although their component units (“analytics”) can be overwhelming in their profusion. Other forms—maps, printed music, and pictures—often benefit from separate listings, as do audiovisual materials—sound recordings, films, and videos—as well as electronic forms, so as to lead to hybrids like discography, filmography, videography, and Webliography. The less the documents look and work like printed books, generally the harder they are to fit into a bibliography, although readers are often best served by including them.

Citation Style: Bibliographical citation practices are spelled out in style manuals, which arose to provide consistent practices for scholarly journals. The many style manuals differ in details and have evolved over the years, but the most important today is arguably the *Chicago Manual of Style* (latest Ed., 2003), now compatible with the dissertation style long associated with Kate L. Turabian. The Modern Language Association prefers slightly different practices in its *Style Manual* (latest Ed., 2008) and *Handbook* (new Ed. expected, 2009), as do the British university presses at Oxford Horace Hart (latest Ed., 2005) and Cambridge (Judith Butcher, latest Ed., 2006). Scientific usage, most often prescribing authors’ given names as initials and the publication date before the title (once called “Harvard style”), is spelled out in manuals from the American Chemical Society (latest Ed., 2006), the American Psychological Association (latest supplement on electronic references, 2007), and the Council of Science Editors (latest Ed., 2006; formerly the Council of Biology Editors), among others. The International Organization for Standardization and the American National Standards Institute have also addressed

bibliographical style. Many publishers further specify their preferences in “house style” sheets. Cataloging codes can often inform bibliographical practice, although compilers commonly adapt the rules for the materials being cited, and with a view to the convenience and background of their selected readers.

Annotation: Compilers often find it important to define the aim, scope, or thesis of the writing being described; to identify the sources and context; to single out significant features; or to praise or incriminate the work (the former best done in understatement, the latter often by quoting the text). The goals of describing and evaluating are not as different as one might think. The writing style may be either conventional prose (to catch the reader’s attention) or “telegraphic” (busy readers, making quick decisions on whether or not to look at the writing, can usually do without the subject and often the predicate). Readers often benefit from comparing and contrasting entries, often done by annotating several entries together.

Organization: Most entry sequences follow one of three orders: alphabetical, chronological, or classified. Alphabetic lists are usually by main entry, most often the name of the author. The alphabet is not intrinsically intelligent but it is easy to search. Chronological lists suggest the growth of the literature, and reflect the ideal of *historia litteraria*. Classified lists display the literature under categories. Compilers are often stimulated by obvious juxtapositions but have second thoughts about titles that belong in more than one or no category. The idea of systematic bibliography is something of a counterpart to the systematic card catalogues in many libraries. Linear sequences usually ask for indexes, in printed lists as either internal cross-references or separate indexes, in computer lists through entry access.

Well designed bibliographies need to be clear, precise, and efficient. In the course of helping readers identify, tabulate, and explore, they are most effective when they lead readers think about the substance rather than the methodology, and to compare entries by moving from broad overview to fine structure.

Bibliographical Searching

Searching for specific citations is unlike subject searching, much like hunting is unlike farming. Readers still need to know the sources they work with, their scope, organization, and citation practices. But they also need to decide whether citations, once located, are actually what they are looking for: will any edition, or version, suffice; how specific must the citation be? Often the exact needs are determined only as the search progresses. Generally, searches lead to one of four outcomes: (1) success: the right citation has been located; (2) positive failure: the citation has been found but it is not what is needed; (3) negative success: the citation has not been

found, but it may be there; and (4) failure: the item has not been found, and it is certain that it is not there. Distinguishing between (3) and (4) is helpful in sizing up the bibliographical infrastructure of the literature. In general, the smaller and more transparent the list being searched, the more easily it can be determined that the result is failure rather than negative success. In many vast lists, it is simply not possible to guess where an item has been logically but ingeniously concealed. For this reason, bibliographical searching benefits from smaller lists and a knowledge of how they work.

The more important the search, the more time should be allotted to it. But many important ones turn out to be very brief: it is often the intellectual curiosity of the searcher that makes them time-consuming. Online searching is almost always faster than work with paper sources, if also less cardiovascular. But printed sources, laid out visually and deployed physically, ask to be searched for contexts. Locating entries is different from understanding them, so searching can be boring and routine or highly stimulating.

PHYSICAL BIBLIOGRAPHY

As nineteenth-century scholarship flourished and became increasingly methodical, the study of the artifactual evidence of bibliography became self-consciously analytical. Antiquarian booksellers and collectors had long known that some books were more desirable than others as physical objects, philologists and literary scholars had understood the importance of authenticity of literary writings, historians had long celebrated the bibliographical lore behind famous events, while librarians and private collectors had long taken special pride in their celebrated rarities. These groups, as they coalesced into bibliographical societies, stimulated each other in their dialogue and wrote up their findings in journals that aspired to the scholarship of academic disciplines. The goal was announced, boldly and provocatively, by W.W. Greg (in the Bibliographical Society’s 1945 *Studies in Retrospect*, p. 25), thus: “bibliography is the study of books as material objects, irrespective of their contents.” This study has come to be seen as several different activities.

Analytical Bibliography

The study of physical books entails an analysis of typography, paper, ink, “printing house practices” (i.e., layout and design, typesetting, imposition, and presswork), as well as illustration and binding. Philip Gaskell’s *New Introduction to Bibliography* (1972) is the standard overview, but much work has been done since his day, as synthesized in many writings and notably discussed in G. Thomas Tanselle’s annual essays in *Studies in Bibliography*. The graphic arts become important in evaluating the

working aesthetics of particular printers, traditions, and periods, while technology is now essential to the study of paper (e.g., the “Leningrad method,” also digitized watermark archives), ink (“PIXE,” i.e., particle-induced X-ray emission), layout (“fingerprinting”) and other evidence. Probably most important of all have been the digital images that make it possible to examine copies in distant locations side-by-side.

Evidence of tampering emerges out of a close study of the physical objects, making analytical bibliography essential to establishing their authenticity. The famous example is the legendary exposure of the forgeries of the highly respected bibliographer Thomas J. Wise, uncovered and written up by John Carter and Graham Pollard in their *Enquiry into the Nature of Certain Nineteenth Century Pamphlets* (1934).

Bibliographers recall Falconer Madan’s phrase, “the duplicity of duplicates,” and instinctively look for differences between copies that appear to be identical, and then seek to explain how and why the differences came about. In work with printed books of the hand-press era, they separate the differences and have conventional names for them. *Editions* are the basic units of production, that is, all the copies run off from the same printing surfaces. *Impressions* distinguish all the copies of a single press run. *Issues* involve changes overtly announced, for instance on title pages, and deal often with conditions of sale. *States* involve covert changes, made within a press run and not meant to be noticed, least of all mentioned on the title page. Often the levels of differences are hard to explain, or ambiguous, in which case the term *variant* is a useful recourse. (The conceptions are Anglo-American: terms used in continental Europe, like *Ausgabe*, *Auflage*, and *triage*, fit awkwardly into their hierarchy.)

Descriptive and Textual Bibliography

Descriptive bibliography is enumerative bibliography informed by analytical bibliography. The goal is to specify the exact particulars of the physical objects for scholarly use. Its rhetoric is ruled by conventions that provide for details that identify the important physical characteristics. Analytical bibliographers need to know the history of the materials and practices of printing and publication. Descriptive bibliographers will also know the grammar for formulating citations based on models that date from Henry Bradshaw in the nineteenth century, as later refined by W. W. Greg and codified in Fredson Bowers’ *Principles of Bibliographical Description* (1949). Enumerative citations are assumed to apply to all copies of a particular title; any differences are irrelevant for the intended readers.

Descriptive bibliographers may identify either a specific copy, with details on all of its relevant idiosyncrasies, or they may conceive of ideal copy (which, in Bowers’

conception, is “a book which is complete in all its leaves as it ultimately left the printer’s shop in perfect condition and in the complete state that he considered to represent the final and most perfect state of the book”). Citations in enumerative bibliographies are generally shorter, and their conciseness is assumed to be sufficient. Descriptive bibliographies explore physical details in order to allow readers reasons either to infer that the description is sufficient, or to record the insufficiencies.

Citations in descriptive bibliographies usually transcribe the title page and collate the gatherings. The ideal title-page transcription covers all its printed statements, often with type styles in “quasi-facsimile” presentation. The collation uses a grammar that records the gatherings by their signatures and the number of leaves in each gathering. A knowledge of early printing practices is essential, beginning with the basic practices of imposing the type within the form of the press, for purposes of accommodating sheets that were later folded once, twice, or three times (so as to produce folio, quarto, or octavo format). The directions of the paper’s chain and wire lines and the placement of the watermark are most often the crucial evidence. Changes during a press run were common. Leaves were added, removed, or cancelled, unsigned gatherings were added at the beginning, or interpolated. The early printing shop was constrained in its conditions—labor was usually cheap and materials were expensive—and the physical book needs to be explained in terms of how it was assembled.

The precise details of producing a physical book often explain its content. Textual bibliography is a search for authenticity of literary works based on a probing of the printed evidence. Its roots are in classical philology, Biblical studies, and modern editorial practice. Its calls on the practices of analytical bibliography to authors whose writings exist in variant printed editions, often in the absence of manuscript sources. Locating the crucial evidence requires a thorough familiarity with the text, a close reading of many copies in search of variants, and a knowledge of printing house practices, as well as an understanding of the authors and their working relationships with their printers, editors, and publishers. Contrary to what one might suspect, there are important differences in the texts not only of earlier authors of the “hand press era” (before about 1830) but also of many twentieth century authors as well.

Historical Bibliography

The written history of the artifacts that define our civilization begins as “book appreciation,” popular accounts of books and printing that recall the classic lore, of Laurens Janszoon Coster in Holland as a possible precursor of Gutenberg, of the Columbus letter and role of printing in the rapid spread of the news across Europe, of the *Depositio cornuti typographici* and Wayzgoose

revelry among printing apprentices and journeyman, of the dispersal of the 1640 *Bay Psalm Book* and the forging of the 1639 “Oath of the Freeman,” of Walt Whitman’s *Leaves of Grass* as a reminder of his work as a printer. The early craftsmen were heroes, their editions were works of art.

Bibliographers delight in these stories, and also in the vast profusion of other names, titles, and events they work with. They were rarely collected into historical narratives, however; before the twentieth century the historiography of bibliography was rather meager. In works like Karl Schottenloher’s *Das alte Buch* (1919, later eds. as *Bücher bewegten die Welt*), the account begins to be framed as cultural history. The *Annales* tradition of French academic scholarship, rich in charts, statistics, and maps, characterizes *L’Apparition du livre* (1958), begun by Lucien Febvre and completed by Henri-Jean Martin, as well as the later *Histoire de l’édition française* (1981–1985), to date the most lavish of several recent national histories of the book. Two complementary exhibitions in London in 1963 further expanded the agenda of historical bibliography. At Earl’s Court, a display on the history of the printing crafts and technology reflected a flourishing scholarship in the processes of book production, obvious tied to analytical bibliography. Two major periodicals emerged—the *Journal of the Printing Historical Society* (1965) and *Printing History* (1979)—along with syntheses based on the acts of production, such as Michael Giesecke’s *Der Buchdruck in der frühen Neuzeit* (1991) and Adrian Johns’s *The Nature of the Book* (1998). The second part of the 1963 exhibition, at the British Museum, was devoted to the first publications of the historic landmarks of Western thought, and led to the celebrated *Printing and the Mind of Man* catalogue (1967), along the way implying the crucial role of the antiquarian booktrade in preserving our cultural heritage. Two other works stand out in the rise of historical bibliography: Elizabeth Eisenstein’s *The Printing Press as an Agent of Change* (1979), which surveys the views of earlier writers who evaluated the impact of Gutenberg’s invention, and Robert Darnton’s study of the archival evidence of the publishers of the great eighteenth century *Encyclopédie* in *The Business of Enlightenment* (1979).

Are there significant differences between historical bibliography and the new fields of study called Print Culture and Book History? (See the entry, “History of the Book,” p. 2142.) If there are, they are subtle and often irrelevant. All of the families of bibliography benefit from being conceived with the needs of both readers and materials in mind. Alfred W. Pollard, one of the heroes from the last century, famously reflected these sentiments when he described bibliography as a “big umbrella.”

Bibliometric Overview of Information Science

Howard D. White

College of Information Science and Technology, Drexel University, Philadelphia, Pennsylvania, U.S.A.

Abstract

This entry presents an account of the core concerns of information science through such means as definitional sketches, identification of themes, historical notes, and bibliometric evidence, including a citation-based map of 121 prominent information scientists of the twentieth century. The attempt throughout is to give concrete and pithy descriptions, to provide numerous specific examples, and to take a critical view of certain received language and ideas in library and information science.

PROBLEMS OF TERMINOLOGY

“Information” and “science”—two formidable words joined. The combination has not gained wide understanding. Few persons can quickly associate it with a subject matter as they can geology with rocks or astronomy with stars. That may be because even expert definitions of information science (IS) resemble attempts to describe an elephant by describing the tent under which it is performing: some given in Zins,^[1] for example, could be parodied as “Information science is the science of data, information, knowledge, and messages.” Abstractions like this also cover, e.g., artificial intelligence, cognitive psychology, cognitive science, computer science, cybernetics, database management, informatics, and systems theory, as attested by *The Study of Information*,^[2] an interdisciplinary volume from a generation ago. One section of that large book resembles the present encyclopedia in being devoted to “library and information science”—L&IS—but this qualification, useful to insiders, is not readily intelligible to ordinary readers. In the popular view, librarians check out books and put them back in order on the shelves. So where is the science? It must involve something like memorizing the Dewey decimal system. Isn’t that what librarians mean by “information”? And hasn’t Google ended all that?

As it happens, even L&IS experts who would laugh at such notions have not clearly established their field for nonexperts. This entry attempts to do that through such means as definitional sketches, identification of themes, historical notes, and bibliometric evidence, including a citation-based map of information scientists. As an overview, it also points to entries in this encyclopedia that develop the histories of certain subfields more elaborately and systematically. It was written wholly independently of the ELIS entry on *Information science*, p. xx by Tefko Saracevic, but turns out to complement his quite well, arriving at similar conclusions through different means (See *Information Science*, p. 2570).

First, a quick commentary on librarianship. Traditional librarianship is not a science, nor is it usually based on science. It is a range of services that many intelligent persons can carry out intuitively. This is not to deny that librarians need coursework. It is merely to say that if “science” is taken to mean novel claims rigorously tested, then “library science,” which dates from the nineteenth century, is a misnomer; it really just means something like “library administration.” In Pierce Butler’s 1933 interpretation,^[3] it connotes a vague ethical stance, as when he recommends that librarians study “function” not “process.” Butler’s book, once considered classic, has been deservedly debunked by contemporary writers, not least his idea of science.^[4,5]

There are, of course, empirical studies of library operations that could be called “library science,” were the term fresh. These studies do reveal new, nonobvious facts about the world, and some of them have been made by librarians.^[6,7] But the activities most people associate with libraries are not defined by them, and libraries would not be markedly different if they had never been conducted. The bent of traditional librarianship is normative rather than positive. That is to say, librarians are not mainly concerned with *what is*, in the scientist’s sense of generalizable truths uncovered through measurement. They are mainly concerned with *what ought to be* in the politics of physical and intellectual access to texts. They are most at home with qualitative standards, such as codes, and ethical pronouncements, such as being for information literacy and against censorship. Library science in this sense is a policy science, not something more rigorous. Students entering library schools have probably gathered as much. They know they already possess the mindset required for professional life, and all they really need for marketability are socialization into the field and some technical skills.

What is gained, then, by tacking “library” onto “information science” to form L&IS? Principally, differentiation from the other information sciences as described by

Machlup and Mansfield^[2] or T.D. Wilson.^[8] Does L&IS belong in this company, or is “L&IS” just another overblown title for what librarians do? The answer is, yes, it belongs, and, no, it isn’t another name for librarianship. Although its various projects are far from being tightly cumulative, decades of evidence from what P. Wilson^[9] calls “bibliographical R&D” compel the conclusion that L&IS is real science and technology. Parts of L&IS are as mathematical as physics. Thousands of studies involve theorizing, measurement, the development and testing of hypotheses, experimentation and other respectable forms of data-gathering, the gradual improvement of explanatory models, and the engineering of real-world systems.

Among the information sciences, moreover, the domain of L&IS is unique. The discipline’s principal object of study is the age-old interface at which people communicate with bodies of related writings—broadly speaking, with literatures. At this interface, people seek to match their interests and questions with responses that would otherwise be hidden in unreadably large masses of text. At the same time, they want responses that meet the standards of their dialogues with other persons—standards of relevance, truth, novelty, timeliness and appropriate length. However, the literature side of the interface is mindless, and whatever responsiveness it has is built into it artificially through systems. Even when these systems include human intermediaries (such as reference librarians), they often function very imperfectly. It therefore makes sense to speak of the literature interface as a barrier that parts of L&IS try to reduce or remove.

L&IS DEFINED

In brief, L&IS consists of *research on literature-based answering*. Central to it are the properties of human questioners, the properties of various mediating systems (since literatures can’t talk), the properties of literatures themselves, and the properties of answers. These interrelated concerns define subfields of L&IS as a scientific and technical enterprise. Taking each in turn:

1. Questioners’ properties, both cognitive and sociocultural, imply what in the past were called user or usage studies and are now known as studies of information behavior. The latter title embeds literature-based answering in a broader context of behaviors, such as reliance on people rather than writings for answers. “User” connotes reliance on formal systems, and part of studying people’s relationship with writings has always been exploring reasons for their nonuse. However, millions of people still seek answers from writings, and how they express their needs through questions put to literature-based systems—for example, in Internet searches—remains a perennial topic of interest. So do the uses they make of information once

found. Many studies have been conducted of information seeking and use in particular groups, such as children, high school students, medical doctors, scientists, and humanists (See the entries on *Information behavior*, p. 2381; *Information behavior models*, p. 2392; *Information needs*, p. 2452; *Sense-making*, p. 4696; *Information searching and search models*, p. 2592; and numerous articles on the information behavior of various groups; *User-centered revolution, 1970-1995 [ELIS classic]*, p. 5461; and *User-centered revolution, 1995–2008*, p. 5496; among others.)

2. Properties of mediating systems—the systems that bring people and writings together—imply research on both verbal instruments and computer algorithms that serve to help people find what they want. The enterprise has been known for more than 50 years as information retrieval (IR), but it has far earlier roots. The verbal instruments have always included bibliographic metadata, such as descriptive and subject cataloging, classification and indexing schemes, and abstracts. The preestablished lists of authorized terms used in subject cataloging, classification, and indexing are called controlled vocabularies. Below these content-laden instruments are the content-neutral computer algorithms. Nowadays on the Web, the natural-language “keywords” by which people put their questions can be algorithmically matched with natural-language “keywords” in the full texts of documents, and the older mediating systems, such as controlled-vocabulary indexing or classification schemes, have been called into question, although they still have their staunch defenders (See numerous entries on information organization and description, such as *Classification theory*, p. 1045; *Descriptive cataloging principles*, p. 1481; *Metadata and digital information*, p. 3610; specific systems such as *Library of congress classification (LCC)*, p. 3383; and *Anglo-American cataloging rules (AACR)*, p. 99; and standards and protocols, such as *Encoded archival description (EAD)*, p. 1699; and *Resource description framework (RDF)*, p. 4539).
3. The properties of literatures imply the field of bibliometrics, which devises measures of the growth, connectivity, impact, scattering, and obsolescence of publications in various subject areas (See *Bibliometric research: history [ELIS classic]*, p. 546; *Citation analysis*, p. 1012; *Information scattering*, p. 2564; and *Webometrics*, p. 5634; among others). Contemporary extensions, glossed in Table 1, are called scientometrics, informetrics, and, most recently, webometrics. Research projects in bibliometrics and information retrieval have often been pursued without much contact, but one major exception involves the citation indexes published by Thomson Reuters. They are studied as retrieval tools in IR and are used to model literatures and investigate citers’ behavior in bibliometrics.

Table 1 Glosses on some overlapping subfields in IS.

Bibliometrics: The quantitative study of literatures. Measures countable properties across multiple related writings and looks for empirical regularities in structure. Can be considered a variety of cliometrics in that it typically deals with historical data that can change over time. May include data on usage of publications (e.g., in library collections). Units of analysis on which counts are made include documents (e.g., articles and books in subject areas), authors' *oeuvres*, and journals; also the publications of organizations or countries, or in particular languages. Can be either descriptive or evaluative in intent. Has its own theory and methods, but is related to such fields as content analysis, text mining, corpus linguistics, and stylometrics.

Scientometrics: Includes bibliometrics, especially as applied to scientific and technical literatures and to patents, but extends quantitative study to units of analysis other than publications, such as scientists and research organizations. May be a quantitative form of the sociology of science.

Webometrics: The quantitative study of Web pages and Web sites in such aspects as their growth and connectivity. Synonymous with cybermetrics, although the latter may be construed as dealing with the entire Internet rather than just the World Wide Web.

Informetrics: As currently defined, covers much of the quantitative side of IS, but focuses more on publications and information systems than on the psychology and sociology of information seekers. Oriented toward statistics and mathematical modeling.

4. The properties of answers, such as their relevance, accuracy, completeness, and concision, imply evaluative research on the output of information retrieval systems. Both before and after the advent of the computer, IR systems can be construed as hypotheses put forward by information scientists as to what will facilitate literature-based answering. A good part of the science of the field consists in testing how well these systems work—assessing their strengths and weaknesses and proposing improvements in the quest for artificially induced relevance (See *Information retrieval experimentation [ELIS classic]*, p. 2526; *SMART system: 1961–1976 [ELIS classic]*, p. 4770; *User-oriented and cognitive models of information retrieval*, p. 5521; *XML information retrieval*, p. 5700; *Web retrieval and mining*, p. 5615; and *Text REtrieval Conference (TREC)*, p. 5182; among others.) Some researchers are now devising systems that try to answer unforeseen questions directly rather than providing documents on a topic. Others are experimenting with algorithmic summarization of documents.
3. The algorithmists and evaluators of experimental computerized document retrieval systems belong to the Special Interest Group on Information Retrieval (SIGIR) within the Association of Computing Machinery, which publishes annual proceedings of the SIGIR conferences. Some of these researchers compete in the Text Retrieval Conference (TREC), an important annual contest staged by the (U.S.) National Institute of Standards for comparative evaluation of retrieval algorithms. Also for technical types, ACM and the Institute of Electrical and Electronics Engineers sponsor a Joint Conference on Digital Libraries, and IEEE by itself sponsors the Conference on Information Visualization.
4. Bibliometricians and kindred spirits have created ISSI, the International Society for Scientometrics and Informetrics. Their specialized journals are *Scientometrics* and the *Journal of Informetrics*.

There are also, of course, generalists whose interests cut across all these organizations and may extend to membership in the American Library Association or other librarians' groups. In Britain such interests meet in the Chartered Institute for Library and Information Professionals, which resulted from a merger of the [British] Library Association and the Institute for Information Scientists in 2002. International conferences intended to have cross-disciplinary appeal include Conceptions of Library and Information Science.

As noted, the phrase "L&IS" is not likely to evoke these definitions and details for most hearers or readers. It is true that libraries hold subsets of literatures and that librarians try to make them responsive to human inquiries. To certain initiates, therefore, libraries are the paradigm of the human–literature interface.^[10] But in practice this interface is not limited to libraries, nor is its scientific study limited to that context. Can the matter be cleared up by substitution of a more suitable word or phrase than L&IS? Not really; if the language provided a better name for the field, it would have been adopted by now.^[11] English in this case is lean in possibilities.

This four-part division has warrant in existing organizations, all with periodic conferences and journals. Repeating the order above:

1. The American Society for Information Science and Technology (ASIST) enrolls members who represent all four parts, but ASIST is now recognizably the home of the so-called cognitive wing of IR, who specialize in information behavior and advocate user-centered design. Among its publications are the *Journal of the Society (JASIST)* and the *Annual Review of Information Science and Technology*. An independent biennial conference called Information Seeking in Context is addressed to behavioral interests.
2. Persons concerned with linguistic aspects of indexing, classification, and metadata are members of ISKO, the International Society for Knowledge Organization. They publish a journal, *Knowledge Organization*.

Leaving “library” implicit, the field becomes just “information science” or IS.^[12] This name connotes “information” in at least two senses—as a synonym for textual content and as the presumed cognitive outcome of reading the texts. “Documentation,” its forerunner, connoted rather less. “Literature science”—meaning in White and McCain^[13] something like “literature response theory”—might suggest major parts of IS better than “library science,” but the other senses of “literature” bar its acceptance; relatively few people think first of subject literatures or linked Web pages as opposed to belles lettres when they encounter the word, and some humanists might deplore the conjunction. The phrase “and technology” is sometimes added to IS to evoke the field’s long-standing stake in engineered systems. All the other information sciences have distinctive names of their own (e.g., artificial intelligence), leaving IS to be principally understood as it is in names like the American Society for Information Science and Technology or the former Institute for Information Scientists in Britain.

MEDIATORS AND AUTOMATION

The founder of the latter organization, Jason Farradane, is also apparently the person who named IS as a field in 1953. He did so by articulating the concept of an “information scientist.”^[14] At least initially, however, he did not use the term in today’s sense of someone who does research on literature-based information systems and their users. He used it in the context of British laboratory work to name a scientist, such as a bench chemist, who is adept in searching the literature for materials pertinent to research projects—so adept that this becomes a full-time occupation. (Thus, one might also see terms like “information chemist” or “literature chemist”; the older “documentalist” had not really caught on.) Dyson and Farradane^[15] call this person “an expert *user* of all sources of information.”

The idea of persons who mediate between inquirers and literatures is certainly not original with Farradane;^[16] one obvious earlier instance of it is the reference librarian.^[17] Farradane’s information scientists, however, were supposed to have more substantive and technical expertise than the typical reference librarian. The same perceived shortcoming has beset librarianship for more than a century. For example, the Special Libraries Association broke away from the American Library Association in 1909 to signal its members’ more particular subject knowledge and more proactive services.^[18] For similar reasons (as well as a greater interest in microfilm technology), members of the American Documentation Institute left mainstream librarianship in 1937.^[19] Or, from the realm of theory, take Havelock et al.,^[20] a massive treatise on the role of persons who link others with potentially useful writings. In seeking to create a corps of such persons who could bring published educational research to school

teachers and administrators for practical application, Havelock modeled his linkers on agricultural extension agents. Librarians of any kind are not even mentioned.

As distinct from a librarian, the expert user of literatures on behalf of others gradually became an “information officer,” “information specialist,” or “information professional,” and Farradane himself evolved into an information scientist as the term is currently understood. At the heart of that understanding lies the idea of *automation* (See *Library automation: history*, p. 3326.) Even in the 1930s and 1940s, what is now called IS had begun its long-term project of automating the human–literature interface.^[21] One well-known godfather of this project is Vannevar Bush. Describing the design of the Memex, his imaginary retrieval device from the 1930s, Bush^[22] summarily dismissed the indexing schemes of librarians and documentalists, whom he also never consulted;^[23] instead, he foresaw that users would thematize their own collections of microfilmed documents with personal “associative trails.”^[21] The implicit tendency of IS, in other words, is to eliminate human intermediaries—the indexers, classifiers, catalogers, abstractors, librarians, and professional literature searchers who stand between textual resources and their non-specialized end users.^[24] Thus, information scientists in Farradane’s original sense have been increasingly marginalized by a line of researchers whose inclination is to substitute algorithmic for costlier manual processes wherever possible. (The process is sometimes explicitly called “disintermediation.”) This has led to the current situation in which the dominant symbol of the human–literature interface is not the traditional library—a room or building staffed by people who provide service with classified, cataloged, and indexed books and serials—but Google, which directly matches the natural language of users with the natural language of documents in cyberspace (For pre-Google antiquity, see *Internet search tools: history to 2000*, p. 2996).

While traditional libraries still have a place in the new order of things, there is much evidence that a profound change has indeed occurred.^[25] Many have seen it coming. For instance, describing “The New Generation” in his book *Digital Libraries*, the computer scientist William Arms writes (ch. 14):^[26]

In 1997, a Cornell student who was asked to find information in the library reportedly said, “Please can I use the Web? I don’t do libraries.” More recently, a faculty member from the University of California at Berkeley mused that the term “digital library” is becoming a tautology. For the students that she sees, the Internet is the library. In the future, will they think of Berkeley’s fine conventional libraries as physical substitutes for the real thing?

THE GOOGLE BOOM

Speaking of Google, it is interesting that its creators, Sergey Brin and Lawrence Page, have never been

members of the American Society for Information Science and Technology and are not usually described as information scientists in the “library” sense. (They were computer science students at Stanford University.) Yet their publications draw on ideas from IS. For example, the idea of algorithmically ranking documents by their suitability as answers (as Google does Web pages) was established in IS decades ago, notably in the work of Gerard Salton. The Saltonian tradition now lives in the proceedings of the Text Retrieval Conferences, one of which Brin and Page^[27] cite when they claim that TREC techniques do not scale up to handling the billions of pages on the Web. The key Google ranking algorithm PageRank, based on counts of links to particular Web pages, was influenced by the idea of citation analysis from bibliometrics, attributed in Page et al.^[28] to Eugene Garfield, the founder of citation databases in science and scholarship.

But more important than Brin and Page’s intellectual ancestry is their practical success in establishing a universal interface between inquirers and literatures in the widest sense. Their search engine has arguably had the greatest impact on libraries of any innovation in the past century. The old and the new are presently joined in such modules as Google Book Search (for retrieving passages from book texts in full), Google Scholar (for retrieving articles and other documents based on bibliographic citations), and OCLC’s Open WorldCat (for retrieving books held by local libraries in response to queries in Google and other search engines). Most notable is the use of Google’s main module—by worldwide nonspecialized publics—for answering reference questions and doing topical literature searches. These developments seem consistent with traditional library values even if they are not particularly auspicious for librarians.

During what might be called the Google boom, work recognizable as IS has become quite fashionable in academe, especially in computer science departments. Moreover, at this writing about 15 of America’s best library schools have morphed into “schools of information,” also known as “iSchools,” with computer science professors well represented on their faculties. In the past, with notable exceptions such as Donald Kraft (Louisiana State University) and Bruce Croft (University of Massachusetts at Amherst), computer scientists have been known to find the research problems of IS unappealingly messy, involving as they do both people and natural language as subject matter. But today the *de facto* technical vanguard of IS includes computer scientists at many elite institutions (for example, Ricardo Baeza-Yates at Yahoo! Research, Susan Dumais at Microsoft Research, Marti Hearst at UC Berkeley, Jon Kleinberg at Cornell, Christopher Manning at Stanford, and Simone Teufel at Cambridge). Most such researchers resemble Brin and Page in not being members of ASIST. Dillon^[29] similarly observes that “the term ‘information science’ has been taken on by philosophers and mathematicians who see themselves very much

distinct from the LIS domain...” The field is also now highly international, with numerous researchers from countries outside the traditional homes of IS in North America, Western Europe, and Russia.

One cause of the upturn in IS-related computer science was the digital libraries initiative of the 1990s. Funded in the United States and Britain by agencies that for years had largely ignored problems of the human–literature interface, this initiative made information scientists of persons who might enter a traditional library only to avoid the rain. The larger attraction was the transformative effect of the Internet and the Web on the world economy, which made new R&D on information systems not only intellectually stimulating but also potentially very lucrative. (Brin and Page are multibillionaires.)

Perhaps the foremost development in current IS is the explosion of interest in graph-theoretical work on dynamic networks—that is, the modeling of groups of entities as countable nodes and links whose counts can change over time.^[30–32] Quantitative network theory is abstract enough to be applicable to many different disciplines, but in IS it has been used to model—and visualize in color—such things as the papers connected by citation in the literatures of science and technology or bundles of hyperlinked pages across the entire Web. These are bibliometric (or webometric) applications. But network theory also turns up in IR—for instance, in the PageRank algorithm and the HITS algorithm,^[33] each employed in Web retrievals. The same methods and formulas can also effectively model interrelated persons, such as “invisible colleges” of communicating scientists or networks of coauthors. Interestingly, the PageRank measure, used to rank pages in Google, resembles an earlier measure, Bonacich centrality, used by sociologists to rank the centrality of people in social networks.^[34] Ranks based on network ties lead to automated recommendations of documents or people as possible sources of information. Google and the online bookseller Amazon.com have shown the relevance of such recommendations to librarianship.

There has long been a mathematical tradition in IS. In bibliometrics, for example, it began with S. C. Bradford and A. J. Lotka and continued with William Goffman and Manfred Kochen. The data typically involve power-law and lognormal distributions. In exploring and possibly exploiting such data today, algorithmically minded computer scientists are joined by physicists (e.g., Albert-László Barabási, Guido Caldarelli) and applied mathematicians (e.g., Mark E. J. Newman). In the past, quantifiers like these have occasionally taken positions in schools of L&IS, but the tendency now is for such persons to “do IS” on a variety of fronts outside the discipline.

It is necessary to mention these new information scientists because existing studies of IS seldom capture them. Existing studies^[35–37] characterize the discipline in terms of contributions to a limited range of home journals. However, the computer scientists and other researchers now

contributing to IS (using that term expansively) publish in conference proceedings, monographs, and journals of their own. No scholar as yet has assembled and analyzed their scattered works in the bibliographic databases ordinarily used to analyze IS as a field, such as Social Scisearch, Scopus, and Google Scholar. As a result, IS is currently defined in terms of past generations of canonical authors (mostly American or British), as opposed to the younger talents who are taking the field in new directions. This is not to say that the canonical figures no longer represent major subfields of IS or that continuity is lacking between old subfields and new—Zhao and Strotmann^[38,39] have made a start toward capturing the latter—merely that, in present research, brain and computer power is being upgraded with unforeseeable but probably dramatic results. Striking advances have occurred, for example, in the visualization of bibliometric data^[40,41] and in text mining,^[42] with implications for tomorrow's libraries. We are a long way from Pierce Butler.

A MAP OF IS

Several information scientists have visualized IS through author maps. White and McCain,^[36] for example, defined the field by mapping the 120 authors with the highest citation counts in 12 IS serials during 1972–1995. These computer-produced maps group authors algorithmically on the basis of cocitation. That is, the authors frequently cited together are placed relatively close together in “intellectual space.” Groups of proximate authors can usually be identified as subdisciplines or research specialties. The broadest groupings in such maps, corresponding to subdisciplines, are, first, authors mainly concerned with the design and evaluation of systems through which people seek answers from subject literatures, and, second, authors mainly concerned with the literatures that may provide those answers and whose quantitative properties are worth investigating in their own right. The first subdiscipline could be sweepingly characterized as “IR,” comprising authors who are, for example, algorithmic retrievalists, computer interface designers, specialists on indexing vocabularies, conductors of user studies, and systems evaluators. The second subdiscipline could be characterized as “Domain Analysis,” made up of authors who are, for example, bibliometricians, citationists, visualizers of scholarly and scientific fields, and researchers on disciplinary communication patterns.

An analysis of one such disciplinary map follows. The White and McCain^[36] data, with one author added, were remapped as a Pathfinder Network (PFNET) in White.^[43] A new configuration of that PFNET appears as Fig. 1. The two articles just cited give methodological and interpretive details, along with the mapped authors' full identities. (A fair number of these authors are referenced and indexed in this encyclopedia.) Here, it is enough to say

that Fig. 1 coherently organizes some major twentieth-century contributors to IS and suggests their degrees of influence. Quite a few of them, one must note, are now dead. Of those living, almost all have attained senior positions in their institutions, and many are retired or near retirement.

The map derives from a matrix in which raw cocitation counts for every pair of the 121 authors have been obtained from Social Scisearch. Most of the author pairs were cocited at least once during 1972–1995, but the PFNET algorithm links each author in the matrix only to that other author with whom he or she has the *highest* (or tied highest) cocitation count. For example, at lower left, Terry Winograd is linked only to Herbert Simon. This means that, of all Winograd's cocitation counts with the other 120 authors, his is highest with Simon. Nearby, William Paisley is linked to both Thomas J. Allen and Diana Crane. This means that Paisley has a tied highest count with both Allen and Crane. All other links are shorn away.

From the PFNET's radical simplifications, strong patterns emerge. To reinforce them, the size of each author's node has been made proportional to the number of other authors directly linked to it. The four authors dominating the linkages—stars in anyone's history of IS—are Gerard Salton, F. W. Lancaster, Eugene Garfield, and Derek de Solla Price. Salton has the most authors linked to him, followed by Garfield. Lancaster, however, is the most central author in the map. Cutting the link between him and Garfield would divide the authors into two subdisciplines of roughly equal size, the top one representing varieties of research in information retrieval and the bottom one representing varieties of domain-analytic research in scientometrics and the sociology of science. Derek Price, a polymath with doctorates in both physics and the history of science, is a key link in the latter.

Authors restricted to one position by PFNETs may in fact have published works in more than one specialty and even in both subdisciplines. An account of the multiple contributions of authors emerges from the factor analysis in White and McCain.^[36] That analysis nevertheless shows these authors' *main* specialties, as perceived by citers, in their highest factor loadings. Authors who load most highly on the same factors tend to be those explicitly linked in Fig. 1.^[43]

Salton and the authors around him are experimental retrievalists. Among them are Cyril Cleverdon and Michael Keen, leaders of the paradigm-setting projects on IR at the Cranfield Aeronautical College in England during the 1950s and 1960s. Researchers in the Cranfield tradition experiment with strategies of indexing and searching to improve scores of effectiveness in document retrieval. They design systems, run trials, and use human relevance judgments to assess the results. They also devise and justify measures by which system outputs can be evaluated (e.g., scores in precision and recall). Most have

Fig. 1 A map of 121 authors in IS, 1972–1995.

mathematical backgrounds, and virtually all are oriented toward statistics and algorithms. For many years their work was identified with “test-bed” collections—relatively small sets of topically constrained documents whose properties they knew well and on which their experiments were conducted. They did not usually evaluate retrievals from large commercial bibliographic databases such as those vended by Dialog or Thomson Reuters (See Salton’s own entry: *SMART system, 1961–1976*, p. 4770). In this tradition, moreover, the judges who assessed retrieved documents for relevance to queries were usually surrogates for end users, and there was little or no work on “real-world” users of systems. Largely pre-Web themselves, the Saltonians’ influence lives on in the Text Retrieval Conferences. TREC members base their research on much larger collections of documents than their forerunners but still resemble them in mindset.

Another group of retrievalists branches off to the left of the Salton group. In the so-called cognitive revolution in IR, which dates from the late 1970s, they increasingly reacted against the experimental retrievalists’ emphasis on systems in favor of a more user-oriented view. (Some of the authors shown around Salton—e.g., Don Swanson and Steven Harter—also did this.) The cognitive group might jointly be seen as “practical retrievalists.” Key transitional figures, maintaining a foot in both camps, are Tefko Saracevic, Nicholas Belkin, and Robert Oddy. Saracevic is linked to the philosopher Patrick Wilson and the psychologist Carlos Cuadra because all are noted for their work on relevance, often said to be the central notion in IS. The names around Belkin are identified with psychological aspects of user theory; around Marcia Bates, with users as online searchers; around Karen Markey, with users of online public access catalogs (OPACs) in libraries. The practical retrievalists are relatively nonquantitative in their approach, and much of their work involves users outside science and technology, such as public library patrons, students, and humanities scholars. Their work also casts doubts on the paradigm of IR that was initiated by the Cranfield team and furthered by experimentalists such as Salton, Keith van Rijsbergen, and Karen Sparck Jones.

The simplifying assumptions of early IR were that indexers describe documents with a fixed vocabulary, that users employ the same vocabulary in searching, and that the system brings both contentedly together when query terms and document terms match in topic. A major achievement of the cognitive group has been to establish that lay users seldom know or can tell the system exactly what they want, and learned users, though more sophisticated, do not robotically interact with a system or judge documents solely by topical match. Neither kind of user is much given to looking up indexing terms in thesauri or classification schedules to assist their searches. Both kinds flounder around exploratively, follow clues to diverse sources, and change their minds. Their search strategies

and relevance judgments are a creative process that goes well beyond the simplified input–output retrieval cycle of the textbooks.

The man who probably did most to popularize the simplified cycle was F. W. Lancaster, the quintessential information scientist between the Cranfield project (in which he participated) and the coming of the Internet. His book *Information Retrieval Systems*^[44] is the *locus classicus* of the paradigmatic diagram in which users’ “request profiles” and indexers’ “document profiles,” both based on controlled vocabulary, meet and sometimes match in a single system. Lancaster’s main factor loading is as an experimental retrievalist, but he was always more oriented toward everyday library practice and operational bibliographic systems than most of the Saltonians. For one thing, he led a large-scale evaluation of real-world document retrieval in the National Library of Medicine’s MEDLINE database; for another, he wrote textbooks on the complexities of actual indexing languages and actual Boolean searching in online systems such as Dialog. He taught a generation of librarians how to take a systems approach to evaluation^[45] and wrote voluminously on many other IS subjects.

It therefore seems fitting that the authors around Lancaster in Fig. 1 are themselves more diverse in their specialties than the authors around either Salton or Garfield. Most have their main factor loadings in general library systems (e.g., Allen Kent, Donald King, Robert Hayes, and Fred Kilgour); others have them in online retrieval (e.g., Martha Williams), OPACs (e.g., Michael Gorman), indexing theory (e.g., Derek Austen), user theory (e.g., Patrick Wilson—a bridging figure with the cognitive retrievalists), and even bibliometrics (e.g., Philip Morse), an area in which Lancaster also published. Many of the “Lancastrian” authors resemble him in being generalists who exhibit a wide range of interests across their publications (e.g., Michael Buckland).

In contrast to this mixed lot, the authors around Eugene Garfield all load most highly on citation analysis, the largest specialty in bibliometrics. Garfield founded the Institute for Scientific Information (ISI)—now Thomson Reuters—in Philadelphia in 1960. At ISI he and his staff developed citation indexes commercially as a new tool for retrieving documents, complementing subject indexes. (Lawyers and judges had long had Shepard’s citation indexes for discovering chains of precedent in legal proceedings, and one of Garfield’s motives for his indexes was to give scientists a way of tracking the chains of corrections, addenda, and retractions that affect the claims made in scientific papers; see p. 162).^[46] From the beginning, however, it was evident that ISI’s large-scale citation databases could be used for more than document retrieval. They could be used to operationalize the notion of scientific specialties as corpora of citation-linked writings—corpora whose composition changed over time, yielding mappable data for intellectual histories.^[41] The databases

could also be used to operationalize the notion of scientific impact or reputation, because they showed the varying citedness of individual papers, authors, journals, organizations, and countries.^[47]

Led by the prolific Garfield and the comparably influential Price, the citation analysts found many new applications of ISI data for descriptive or evaluative purposes. One of Garfield's contributions was the well-known journal impact factor, still widely used for assessing the prestige of journals, although various replacements have been proposed.^[48] Price virtually created the field of scientometrics by using citation data to study, e.g., author productivity (acknowledging Lotka as a forerunner), the growth of literatures, networks of scientific papers, invisible colleges, differentiation of the hard and soft sciences from the humanities, and cumulative advantage as a model of differences in scientific reputations. Among other innovators, Francis Narin, Mark Carpenter, and J. D. Frame did pioneering work on evaluative bibliometrics, notably on networks of journals that cite each other. Henk Moed and B. R. Martin are known for their uses of citation analysis in evaluating research teams at institutes and universities. Maurice Line gathered citation data to study the ageing (i.e., decline in use) of literatures; so did Belver Griffith. M. M. Kessler came up with the static associative measure called bibliographic coupling—the number of references documents share in their endnotes. Henry Small (Thomson Reuters's director of research) topped this with a dynamic associative measure, cocitation—the number of later papers that cite any particular pair of earlier ones. Howard White and Katherine McCain generalized Small's cocitation measure to authors' *oeuvres* and journals, respectively. Besides having uses in retrieval, bibliographic coupling and cocitation measures underlie the maps of science (such as Fig. 1) that have been appearing since the 1970s.

Linked to Price at right are B. C. Brookes's group of theoreticians who contributed significantly to the mathematical side of bibliometrics. Their work is concerned with fundamental processes of literature dynamics rather than with citation analyses of particular fields. Famous early students of these processes, all with distributions of bibliometric data named after them, are S. C. Bradford (connected to Brookes), A. J. Lotka (connected to Price), and George Zipf (connected to Herbert Simon at far left). Brookes himself, Ferdinand Leimkuhler, Robert Fairthorne, and Brian Vickery are all known for their work on "Bradford's law" (which pertains to regularities in the distribution of articles on a subject over journals). Leo Egghe, who was Brookes's doctoral student, is currently a leader in mathematical IS and the founding editor of the *Journal of Informetrics*.

From Price leftward, most of the authors represent disciplines other than IS. However, they share his interest in communication patterns in science and technology (which include citation networks and invisible colleges). Robert

Merton's group are largely identified with one of his specialties, the history and sociology of science. Merton, Harriet Zuckerman, and Thomas Kuhn (of paradigm fame) helped to legitimize citation analysis theoretically. Stephen and Jonathan Cole, Diana Crane, William Paisley, and Ronald Rice have all published citation analyses themselves, although their research topics are considerably broader. Herbert Simon (the Nobel laureate) and his group are sources of ideas imported into IS. Quantitative work by Simon and Zipf, for example, has been used in bibliometrics, and Claude Shannon's way of measuring "information" has had a diffuse influence.

TOO NARROW A VIEW?

As stated at the outset, many experts define IS at a high level of generality. This entry attempts to define IS more concretely by describing its center. It attempts to state the field's main scientific and technological concerns—literature-based answering, the human–literature interface—with many specific examples. When that is done, readers can assess not only what has been included but what has been excluded, and the exclusions can be judged. On grounds of clarity, that seems preferable to formulations of IS that imply anything and everything, from cloth books for preschoolers to the genetic code. (The same vague imperialism softens the field's name to "information studies.") Two earlier pieces by White and McCain^[36,49] took a similar line, and both have been criticized as leading to unduly narrow conceptions of IS. A bit more exposition thus seems called for, one that also extends earlier definitional themes.

Fig. 1 is a core-and-periphery model of IS; it depicts specialties as central authors surrounded by less central ones. It also depicts Lancaster's group as being the most central. Through Lancaster, the retrievalists above and scientometricians below are joined to a diverse group of generalists with applied interests in real-world libraries and information systems. However, if the center of the field is conceived more widely, the entire map of 121 authors can be taken as modeling the core of IS. On analogy with a target, it would be the bull's-eye in a set of concentric circles representing adjoining specialties and disciplines. (Something like an outer circle of authors now radiates left from Price.)

Does this mean, however, that just these 121 authors and no others fully characterize IS? Certainly not. First, they represent the period 1972–1995, and, as stated earlier, a whole new generation of information scientists has risen since then. (Mapping approximately the same intellectual space, Zhao and Strotmann^[38,39] show both new names and new specialties joining the older ones.) Second, while the 121 are an elite of sorts—they are the top citees in a set of 12 serials oriented toward IS and library automation—the cutoff was determined mainly by

computational and presentational limits. The elimination of lower-ranked contributors to IS or librarianship (or both) was not meant to deny them a place in the field or to impugn what they write about. It simply means that, across 12 representative serials, the work of certain authors has been the most prized by their citing colleagues. Revealing the nature of this work is an evidence-based way of bringing a field into focus.

Not seeing their own interests represented in Fig. 1, Danton^[50] and Webber^[51] questioned the set of serials from which the top authors were chosen. White and McCain^[36] acknowledged that the names they mapped were far from exhausting the field. A larger sample from the same or different serials would indeed add both authors and specialties. Areas such as library management and library education, for example, could be induced in Fig. 1 by expanding the pool of citees to include authors like Richard de Gennaro and Herbert S. White, both highly cited during 1972–1995 in library-oriented serials not among the original 12.

The subtext here, however, is that what appears on a citation map is never wholly value-free. It has a political dimension in which invidious comparisons are made. People who do not find themselves or their specialties on a map may feel slighted. Or they may fear that the maps will be used prejudicially, to rule out creativity in new directions.

In the latter vein, P. Wilson^[52] argued that IS is both messier and far richer than White and McCain's^[49] "restrictive" characterization of it as IR and bibliometrics, which is essentially repeated in Fig. 1. Cronin^[53] argued that the "exclusionary" maps in White and McCain^[36] may have revealed something of classical IS, but miss the many other contributory literatures being explored in the *Annual Review of Information Science and Technology* (ARIST), whose editor he had just become.

Obviously the White and McCain papers do not stifle creativity, or there would be no new literatures for ARIST to review. But in one sense Wilson and Cronin are correct: cocitation analysis drastically simplifies. The maps are high-altitude views of the consensus hidden in the bibliographic record. This consensus has been evolving over years or decades, and so the maps inherently look toward the past rather than the future. The best that can be said for them is that they provide a check on the overinclusive definitions of IS that many experts seem to favor. The *Online Dictionary for Library and Information Science*, for example, defines IS thus: "The systematic study and analysis of the sources, development, collection, organization, dissemination, evaluation, use, and management of information in all its forms, including the channels (formal and informal) and technology used in its communication." This phrasing covers all of the more than 500 sprawling, interdisciplinary ARIST chapters ever written, but also all of interpersonal communication, all of mass communication, all of education, and all of remote sensing (to go no further)—enormous areas of study that already have

plentiful researchers of their own. At the same time, it misses what is both central and unique to IS, namely the human–literature interface.

Another check on the nature of IS appears in Table 2, which shows the 20 ARIST chapters most highly cited in the Web of Science (WoS) and Google Scholar (GS) as of early 2008. Most of these chapter titles concisely imply what is now the human–computer–literature interface as an object of scientific study. The top 20 are taken from the entire run of ARIST, 1966–2007, and are a merger of the top 15 titles in each database. In each set of 15, 10 titles overlapped and 5 were unique. The unique chapters appear in Table 2 with abbreviations of their sources; the overlapping chapters are unmarked. The WoS counts reflect citations in the journal literatures covered by Thomson Reuters. The GS counts reflect many of the same citations but draw on a wider range of sources (e.g., conference proceedings, books) and so are usually higher. The WoS counts are higher for relatively old chapters.

The topics that come to the fore accord quite well with the divisions of IS given here. Information behavior studies are well represented. So is IR, in both its algorithmic and cognitive wings; so is the bibliometric study of literatures, including the recent emphasis on visualization. The one area not immediately apparent is the linguistic side of bibliography, as seen, for example, in discussions of subject indexing, classification, search strategies, metadata. That area is indeed present at the level of chapter titles in ARIST; it is just further down in the rankings.

Several titles in Table 2 imply that IS includes studies of communication between people. According to Webber,^[51] this is an area that White and McCain^[36] explicitly leave to other fields. More accurately, the latter paper claims that the *main* dialogue studied in IS is that between people and literature-based information systems. But interpersonal dialogues oriented toward that center have always been and will remain important topics in IS. For example, no one would rule out research on how reference librarians interact with their customers, or on how colleagues consult as a means of avoiding literature searches, or even on how people inform themselves when, for whatever reason, they have little or no access to publications of any kind. There are, however, countless other studies of interpersonal communication that address matters information scientists never will. Does this mean that all such studies are irrelevant to IS? Not if the right context is set up; IS borrows from other fields all the time. Yet it also seems likely that most would enter IS in a very limited context. They would be cited once or twice, rather than repeatedly.

The lesson to take away is that virtually all definitions of IS need elaboration with examples. The present account has advocated a way of getting examples that is distinctive to IS—by citation counts, using the ranking principle that is fundamental to both IR and bibliometrics. The ranked citation frequency distributions underlying both Fig. 1 and

Table 2 Major topics in IS as shown by the most-cited ARIST chapters, 1966–2007.

Year	Titles	Authors	WoS	GS
1986	Information needs and uses	B. Dervin, M. Nilan	317	383
1994	Relevance and information behavior	L. Schamber	144	212
1989	Bibliometrics	H. D. White, K. W. McCain	132	215

2002	Collaboratories (GS)	T. A. Finholt	23	112

Table 2 are highly typical of bibliometric data. They consist of a relatively small core of highly cited items, a larger number of decreasingly cited items, and a still longer tail of items with little or no citation. Ranking by citedness raises some items above a certain threshold, as if by balloting in an election. Those, in the judgment of all citing authors, are the items most relevant to the field. So how to prioritize one's examples for greatest relevance? Look to the cores.

Bibliometric Research: History [ELIS Classic]

Dorothy H. Hertzell

Case Western Reserve University, Cleveland, Ohio, U.S.A.

Abstract

Hertzell marshals a vast amount of information on the origins and development of one of the core areas of information science research—bibliometrics, or, as it is also known, informetrics. The study of the statistical properties of the domain of recorded information is a large field with an extensive body of research results.

—*ELIS Classic*, from 1987

INTRODUCTION

The word “bibliometrics” first appeared in print in 1969 in Alan Pritchard’s article “Statistical Bibliography or Bibliometrics?” in the December issue of the *Journal of Documentation*.^[1] Pritchard’s article was the result of his judgment that the expression “statistical bibliography” should be replaced with a better term. He used “statistical bibliography” in his unpublished “Computers, Statistical Bibliography and Abstracting Services”^[2] and again in his *Statistical Bibliography: An Interim Bibliography*, published in May 1969.^[3] In December 1969, in “Statistical Bibliography or Bibliometrics?” he stated, “The term [statistical bibliography] is clumsy, not very descriptive, and can be confused with statistics itself or bibliographies on statistics.”^[1] As a result of the prompting of his friend, M.G. Kendall, Pritchard suggested that the word “BIBLIOMETRICS, i.e., the application of mathematics and statistical methods to books and other media of communication” be substituted for “statistical bibliography.”^[1]

In the same issue of *Journal of Documentation* appeared Robert A. Fairthorne’s classic article “Empirical Hyperbolic Distributions (Bradford–Zipf–Mandelbrot) for Bibliometric Description and Prediction,”^[4] in which the author used the word “bibliometric” and acknowledged Alan Pritchard as the donor of the term.^[4] Fairthorne, a close friend of Pritchard, admitted that a phrase in the article—“This term [bibliometrics] resuscitated by Alan Pritchard”^[4]—incorrectly suggested previous use, but in personal correspondence, he definitely verified that “Alan Pritchard *did* coin the word ‘Bibliometrics’.”^[5]

Because the relation between the terms “bibliometrics” and “statistical bibliography” has now been established, it seems imperative that a history of bibliometrics should begin with its predecessor, statistical bibliography and its components: statistics and bibliography.

BIBLIOGRAPHY

“Bibliography” was derived from two roots: *biblion*, book; and *graphos* from *graphein*, to write.^[6] Webster defined it as a “history of books, an account of manuscripts. . . and information illustrating the history of literature,” as well as “a list of an author’s writings; or the literature dealing with a certain subject or author.”^[6]

“In post-classical Greek times, when the word originated, it meant the writing or copying, i.e., the production of books; as late as the eighteenth century it was understood as the study of these ancient manuscript books.”^[7] Through the centuries, the meaning of “bibliography” has undergone a series of changes, some of which are considered here.

Monks, in copying manuscripts, also made lists of the books being copied; these lists, catalogs, or inventories are considered early bibliographies. At first, there were only limited numbers of lists of books or catalogs. Georg Schneider suggested this was because of lack of titles, limited need, and a limited area. He stated that, in the narrow sense, bibliography is a “study of lists of books” and further suggested that “true [i.e., modern] bibliography” began in 1564 when Georg Willer of Augsburg published his catalog of books, a listing for sale by him at the Frankfurt fair.^[8]

From individual listings, bibliography progressed to the attempt to produce a “world bibliography.” Konrad Gesner (1545) made the “first attempt to collect in one list all the scholarly publications of the world in bibliographic form,”^[8] resulting in his having been acclaimed the “Father of Bibliography,”^[8,9] but here, there is a difference of opinion. Archer Taylor claimed, “we may conveniently date bibliography from the activities of Johannes Trithem, a practical and theoretical bibliographer of the late fifteenth century,” but he agreed that “another man who was to display an even greater ability as a bibliographer” was Conrad Gesner (Murray acclaims “The

Bibliotheca of Conrad Gesner, a monument of human industry and one of the triumphs of bibliography.”^[9],^[10]

Between 1600 and 1700, bibliographies on particular subjects were published; these “are descriptive accounts of the literature of the subjects they deal with rather than catalogues of books.”^[9]

Taylor’s investigations led him to the conclusion that “By 1700 bibliography was a highly developed art. And it was more than that: It was a deliberate and conscious maintainer of an intellectual and learned tradition descending from the beginning of time. . . .”^[10] This tradition can be traced to the beginning of the sixth century with the founding by Cassiodorus of an Italian monastery, one of the rules of which was the service of God “by diligent study and carefully copying of texts,”^[11] and in the establishment in 529 of the Benedictine Order with its “very great emphasis on reading.”^[11]

The transition of meaning of bibliography was probably due to numerous reasons. These include the greater availability of books; rise of a middle class; development of “public” libraries; more people becoming literate; the passing of the Renaissance and advent of the Reformation; continued interest in humanism; the time of Galileo, Descartes, Kepler, and Newton; and the beginning of scientific progress.

By the eighteenth century in France, bibliography was “writing about books;”^[8] later, it was called “the science that deals with literary production”^[8] and finally, “the science of books.”^[8]

According to Thomas Hartwell Horne,

GENERAL BIBLIOGRAPHY. . . is, in strict language, a science; which consists in the knowledge of books, of their different editions and degree of rarity and curiosity, their real and reputed value, and the rank which they ought respectively to hold in a system of classification. General bibliography comprises works or catalogues, whose design is to give us a knowledge of every kind of book whatsoever. . . .^[12]

Bibliography is one of the oldest and yet one of the most modern of the sciences. It is old, because at all times scholars had lists of works of authors, catalogues of libraries, and other similar aids; it is modern, because it is only within a comparatively recent period that bibliography has been developed systematically.^[9]

In 1935, Oxford University Press published *The Beginnings of Systematic Bibliography* by Theodore Besterman. Besterman divided bibliography into two parts, “the enumeration and classification of books, and the comparative and historical study of their make-up.”^[13] His research indicated that “bibliographies started as biographies in which the writings of the subjects were referred to as facts in their lives.”^[13] Eventually this slant changed, with the emphasis on the writings becoming the more important.

Current bibliography may be said to be the result of demands of research, development of numerous journals, and the formation of many societies, literary and scientific.^[14] It can be concluded that the most important change in the meaning of bibliography was caused by change in its purpose, which at first was to preserve or record past items (lists or inventories), whereas its primary purpose now is to aid in dispensing knowledge (guides).^[14]

This supports E. Wyndham Hulme’s *Statistical Bibliography*, in which he defined bibliography as “the science of the organization of recorded knowledge.”^[15]

STATISTICS

“Statistics” was derived from the German “Statistik,” which came from the medieval Latin “statisticus,” which in turn was derived from the Latin “status” meaning state, position, standing (Latin for “to stand”).^[16]

Statistics

as a plural noun means collections or sets of facts that are related. . . . In practice, it is customary to restrict its meaning to facts that are numerical or can in some way be related to numbers. As a singular, collective noun, statistics means the science of collecting or selecting statistical facts, sorting and classifying them, and drawing from them whatever conclusions may lie buried among them.^[17]

In other words, “statistics” means facts or data of a numerical kind, assembled, classified, and tabulated to present information about a subject; originally, it referred to the physical, social, economic, intellectual, political, and industrial state of a country or its people as indicated in tables or numerical statements.

Yule and Kendall, in their *An Introduction to the Theory of Statistics*, first published in 1911, wrote that the now obsolete term “statist,” meaning a statesman or politician, was used as early as 1602 in Hamlet,^[18] and that the

earliest occurrence of the word “statistics” yet noted is in *The Elements of Universal Erudition* by Baron J.F. von Bielfeld (1770). One of its chapters is entitled “Statistics” and contains a definition of the subject as “The science that teaches us what is the political arrangement of all the modern states of the known world.”^[18]

Studies in the History of Statistical Method, by Helen Walker, asserted “The term “Statistik” occurs for what is probably the first time in the writings of Achenwall who is usually hailed as the father of statistical science.”^[19] His first statistical work appeared in 1748 and occurred in 1749 as the introduction to another of his works. The term “Statistik” was used in the preface.^[19] Helen Walker’s research led her to state that Achenwall and others “did

not devote themselves so much to enumeration and computation as to verbal descriptions of the political situation and of all facts of interest in their countries.”^[19]

Although the word did not appear until the eighteenth century, the rudiments of the subject, statistics, were found in very early ancient times and at first were only approximate counts. As early as 2000 B.C., there was a population census in Judea;^[20] in ancient Rome and Greece, the census was taken for real estate taxes; and in the Middle Ages, there were taxes, tithes, and land registers of various countries.^[20] As early as “762 Charlemagne ordered the detailed descriptions of church lands”^[21] in France, and by the first half of the ninth century, “the serfs and peasants being attached to the land were included in the land census.”^[21] Eventually, it became necessary for those in power, for their own protection, to know their military and financial standings and that of other powers. Thus,

In the beginning, statistics considered the most urgent need of the period, namely the knowledge of the state, and as its method comparison, without, however, possessing an exact sense of proportion nor a distinct consciousness of the necessity of measurement.^[20]

The gradual change in the meaning of statistics was a result of the era and the conditions of the time, starting with a listing of land ownership and progressing to a description of states, but at first, statistics was not an exact enumeration. Further development was due not only to the change from feudal or medieval system to the “modern state” but also to the need to know of the comparison status for an evaluation of power which necessitated more accurate counting.

Gradually, statistical facts became “public” knowledge, for as early as 1536–1544 the *Cosmographia* of Sebastian Muenster described the world, giving maps of known countries, history, organization, laws, customs “and in detail the chief cities with their wealth and trade.”^[20] This may be called “descriptive statistics.” Various other works followed; these included public laws, estimates of taxes, military strength, and commerce. In 1626, “the publication of the so-called *Respublicae Elzeviranae*,” which gave descriptions of single states written by distinguished statesmen of the period,^[20] was begun. In 1660, statistical studies were introduced into the curriculum of the University of Helmstedt, and from there, the giving of similar lectures spread to other areas.^[20]

It was during the “17th century [that] the games of hazard grew into prominence”—lotteries, probabilities in games of chance, and annuity life insurance,^[20] and this is thought to be the true beginning of inductive statistics, explained as follows by Walpole: “Any treatment of data leading to predictions or inferences concerning a large group of data is known as *inductive statistics*.”^[22] Based on the theory of probability, which had its beginning in

gambling or games of chance, inductive statistics projects or determines a possible or probable outcome.

History showed that Galileo was consulted for solutions to some problems on gambling, solved the problems, and wrote a paper concerning games of chance. Not long after in France, Blaise Pascal was approached by his friend Chavalier de Mere with similar questions.^[17] “Chevalier de Mere proposed to B. Pascal the fundamental “Problem of Points” to determine the probability which each player has, at any given stage of the game, of winning the game.”^[23] (See V. Sanford, who claimed this problem was in evidence as early as 1494.)^[24] Pascal shared the problem with his friend, Fermat. Both solved the problems, but by different methods. Pascal, as a result of his work, developed the theory of probability.^[17] In 1657, Huygens developed a treatise on probability which was later included in Jakob Bernoulli’s *Ars conjectandi*.^[23] Bernoulli, elaborating on the subject, made the innovative suggestion that the “ideas [of probability] might be applied to civil, moral, and economic affairs.”^[24]

Shortly after, Abraham de Moivre published *The Doctrine of Chances*, the outcome of which study led to the development of the normal curve of distribution.^[24] This same bell-shaped distribution is “often referred to as the *Gaussian distribution*, in honor of Gauss (1777–1855) who also derived its equation from a study of errors.”^[22] The ideas of probability also led to the further development of insurance which was based on “mortality.” During the seventeenth century, some investigators had used vital statistics to make predictions and draw some very interesting conclusions.^[20] The “first attempt to interpret mass biological phenomena and social behavior from numerical data—in this case, fairly crude figures of births and deaths in London from 1604 to 1661”—was in *Natural and Political Observations Made upon the Bills of Mortality*, by John Graunt of London in 1662.^[25]

John Graunt (1620–1674) was born in London and was a shopkeeper by trade.

The Bills of Mortality which attracted Graunt’s attention were issued weekly by the company of parish clerks and listed the number of deaths in each parish, the causes, and also an “Account of all the Burials and Christnings, hapning that Week.”^[25]

Impressed with Graunt’s work, Charles II fostered his membership in the Royal Society of London. The influence of Graunt’s work spread and soon affected “the gathering and study of vital statistics on the Continent.”^[25]

Thirty years later, Edmund Halley, of comet fame, at the request of the Royal Society, wrote the mortality rates report “An Estimate of the Degrees of the Mortality of Mankind, drawn from curious Tables of the Births and Funerals at the City of Breslaw; with an Attempt to ascertain the Prices of Annuities upon Lives.”^[20]

This was followed by “Some further Considerations on the Breslaw Bills of Mortality.” Together, the papers are the foundation for all later work on life expectancy, indispensable, of course, to the solvency of life-insurance companies.^[25]

“During the eighteenth century it [subject of probability] developed rapidly, and in the nineteenth it found application in the mathematical study of statistics.”^[24]

On the other hand, the approach of Gottfried Achenwall, the father of statistical science, was descriptive. In 1746 he began his statistical lectures and soon had some of his related writings published; in the introduction of one of these appeared for the first time the word “statistik.”

Up to this time the word had been merely suggested. . . by *statista*, one versed in the knowledge of the state, or by the adjective use, *rationes statisticae*, by Oldenburg, 1668, *bibliotheca statistica*, by Thurmann in 1701, and the *collegium statisticum* of Schmeitzel. Achenwall derives the word from the Italian, *ragione di stato*, practical politics, and *statista*, statesman.^[20]

He alleged the “final object [of statistik] is to gain political wisdom by means of knowledge of the various states” both internal and external.^[20]

In 1749, Achenwall’s work which later became *Reiche and Völker* was published.^[20] This covered “Spain, Portugal, France, Great Britain, the Netherlands, Russia, Denmark, and Sweden,” giving a careful picture of each, of land and peoples, in seven distinct groups of questions:

1. The literature and sources of information.
2. The state, its territory and the changes of the same.
3. The land, its climate, rivers, topography, divisions, abundance or scarcity of products.
4. The inhabitants, numbers and character.
5. The rights of the rulers, the estates, the nobility and the classes of the inhabitants.
6. The constitution of the court and the government, laws, and administration of churches, schools, and justice, industry, home and foreign commerce, currency, finances, debt, army and navy.
7. The interests of national life and politics, as well as the outlook for the future.^[20]

“The work found such general recognition that it was translated into all languages,” with the result that Achenwall’s concept of statistics in addition to the word was widely distributed and accepted.^[20]

Running parallel with Achenwall’s idea was the need for lists of “official statistics”—tables of vital statistics, census, and demographics. By 1782, the scope of the tables had been expanded considerably, and “the statistical details [were] collected in general outline tables.”^[20] The information was not only descriptive, it was exact enumeration.

The origin of the publication of details of official statistics has been attributed to Anton Friederich Büsching.^[20] He is also credited with the founding of *Das Magazin für Historiographie und Geographie*, claimed to be the first statistical periodical because of its statistics from many German and other countries.^[20] Büsching’s importance resulted from his interest in details and not in generalities as in Achenwall’s case, and this interest in details “led to a careful examination as to the completeness and correctness of the data, and promoted, by the scrutiny of their origin and arrangement, the progress of critical methods.”^[20]

Throughout the 1800s, numerous countries developed commissions, departments, or bureaus of statistics with publications of various reports and annuals. Undoubtedly, the developing spirit of nationalism, free trade movement, and world exhibitions were contributing factors to the ever-rising interest in statistics.^[23]

Adolph Quetelet, a Belgian statistician and sometimes referred to as the founder of modern statistics, “developed the conception of statistics as a general method of research applicable to any science of observation,”^[19] and his theory widened the application of statistics when he applied statistical methods to education and sociology. Quetelet, responsible for the First International Statistical Congress which was held in Brussels in 1853, was also “one of the first statisticians to demonstrate that statistical techniques derived in one area of research are also applicable in most other areas.”^[22]

By 1872, M. Haushofer by stating “statistics is a method and a science. . . designates statistics as an essentially methodical science,”^[20] and this was supported by August Meitzen, a German professor, who in 1886 evaluated statistics as “a method of scientific investigation by means of enumeration of objects and the numerical comparison of the results of such enumeration.”^[20] His concept of statistics was that it is a “science of method” based on counting plus a comparison of the results.

This information leads to the conclusion that statistics may be divided into two areas, descriptive and inductive, or inferential. Descriptive statistics is really a description or compilation of data in a form that is clear and usable, whereas in inductive statistics, data pertaining to a sample of a population are used to arrive at a probable conclusion or prediction concerning the whole. Blalock called this “generalizing on the basis of limited information.”^[26] The conclusions of inductive statistics, based on incomplete data, being uncertain or probable, depend on the theory of probability,^[22] and though the original meaning of statistics dealt with counting, the modern statistical method “deals more with the design, execution, data analysis, and interpretation of studies.”^[27]

Originating as the mathematical tool of the gambler, the science of probability has become fundamental in the

knowledge of the physicist, the biologist, the technologist, the industrialist, the businessman, and the philosopher.^[17]

It seems logical that the science of probability and statistics would also have been used by the librarian or the bibliographer and eventually applied to the field of bibliography. So, statistics, using the theory of probability (counting, analyzing, and interpreting) combined with bibliography (knowledge dispensers) became statistical bibliography, as Pritchard defined it.

STATISTICAL BIBLIOGRAPHY

In the papers using the expression “statistical bibliography,” there are only a few explanations of what is meant. Researchers claim E. Wyndham Hulme (1922) was the first to use the expression,^[15] and according to Alan Pritchard, from then until 1969, only two other authors, Charles F. Gosnell and L. Miles Raisig, used the phrase. Antecedent to Hulme was Cole and Eales’s use of “statistical analysis” in “The History of Comparative Anatomy, Part I (1917).”^[28] After Hulme, “statistical bibliography” was used by Gosnell in 1943 in his dissertation, “The Rate of Obsolescence in College Library Book Collections, as Determined by an Analysis of Three Select Lists of Books for College Libraries”^[29] and in his article of 1944, “Obsolescence of Books in College Libraries;”^[30] and by Raisig in 1962 in his “Statistical Bibliography in the Health Sciences.”^[31]

Hulme believed “statistical treatment must show the existence of phases of activity and retardation in each science and might even indicate approximately the period when its ultimate boundaries would be reached.”^[15] “Bibliographical statistics, employed with the requisite qualifications, are without question able to reveal the shape and period of such movements.”^[15]

Cole and Eales, calling their work a statistical analysis of the literature, graphically represented the “activities of comparative anatomists for a period of time.” As they stated,

In other words it seemed possible to reduce to geometrical form the activities of the corporate body of anatomical research, and the relative importance from time to time of each country and division of the subject.^[28]

Here we have tabulations, charted and analyzed as to the important periods in the development of anatomy study or progress.

Gosnell’s doctoral thesis, “The Rate of Obsolescence,” purports “to discover lines of trend or curves of distribution by means of which this rate of obsolescence may be expressed in mathematical form.”^[29] “The degree of such obsolescence may be discovered by statistical analysis.”^[29] His Chapter II, Statistical Bibliography, was

divided into several parts, the first of which was a definition.

In bibliography, which is the science of history and description of books major emphasis has always been qualitative. . . . Very little attention has been given to the significance per se of the number or bulk of publications in a group or series. *Statistical bibliography* implies emphasis on the quantitative aspect rather than the qualitative.^[29]

Using “three select lists of books for college libraries, the Shaw *List*, issued in 1931, the Mohrhardt *List*, 1937, and the Shaw *Supplement*, 1940,”^[29] Gosnell proceeded to make an analysis, developing a curve of obsolescence after first preparing tables of the distribution of imprint or publications dates. He also made the observation that “The curve of obsolescence in a sense represents the reverse of compound interest.”^[29]

In “Obsolescence of Books,” an article based on his thesis, Gosnell used two assumptions; the first suggests that principles of choice may be discovered by the documentary analysis of the list.^[30] (Here Gosnell is qualifying his use of the specific three lists.) “The second [under the section heading, Statistical Bibliography] is that mere masses of books (or titles) may be analyzed for certain characteristics without reference to their individual titles.”^[30] Here using “collections of books as populations,” he suggested that certain characteristics or trends be noted to make a reliable prediction of obsolescence.^[30]

Gosnell’s idea that “Books represent one of the higher forms of culture and the rate at which they are discarded and replaced may give some suggestion as to the rate of evolution of the general culture of which they form a part” seems to be a variation of the Hulme theme.^[30]

Raisig, claiming there was a “potential utility of statistical bibliography as a method of analyzing information needs,”^[31] stated that his article was “a review of investigative methods and results in the health sciences.”^[31] He gave the following as definition of “statistical bibliography:” “the assembling and interpretation of statistics relating to books and periodicals; it may be used in a variety of situations for an almost unlimited number of measurements.”^[31] He continued,

bibliographical statistics have been collected. . . for these [three] main purposes: to demonstrate historical movements, to determine the national or universal research use of books and journals, and to ascertain in many local situations the general use of books and journals.^[31]

“The citation analysis of the research usage of periodicals has yielded the greatest number of published results and the greatest variety of interpretations.”^[31] Raisig’s article leaned to a discussion of citation literature with particular critical emphasis on the Gross and Gross analysis (see the next section, Seminal Bibliometric Papers).

Glenn Wittig, in his extensive research, found several more users of “statistical bibliography:”^[32] H.H. Henkle in 1938 in the article “Periodical Literature of Biochemistry;”^[33] Herman H. Fussler in 1948 in his dissertation, “Characteristics of the Research Literature used by Chemists and Physicists in the Soviet Union,”^[34] which was also published in *Library Quarterly* in 1949,^[35] and Dale Barker in his dissertation of 1966, “Characteristics of the Scientific Literature cited by Chemists of the Soviet Union.”^[36]

Henkle’s paper used the expression “statistical bibliography” to report “the results of a study in which the methods of statistical bibliography were applied to an evaluation of the periodical literature of biochemistry.”^[33] Although he did not “define” statistical bibliography, he did state, “the bibliographies [he used] were analyzed statistically and a list of journals arranged in the order of the frequency with which they were cited.”^[33] He believed his research would help in the “problem of selecting periodicals for the library.”^[33] Henkle listed many papers of biomedical interest which have been patterned after the Gross and Gross method. His interest is a research study of citations in the biochemistry field and he made comparisons with the results of other scientists, concluding “one of the important facts shown by these bibliographical studies is the extent to which the journal literature demonstrates the interrelationships of the sciences.”^[33]

Fussler’s research, published as two papers in the *Library Quarterly*, examined the characteristics of the literature of chemistry and physics. Although Fussler wrote, “This study is a form of statistical bibliography,”^[35] he did not define statistical bibliography. However, he did make this explanatory remark:

A number of analyses of research literature have been made by listing the references contained in one or a group of important journals in the field to be surveyed. Various considerations suggested that the adoption of this technique or some modification of it would yield the most useful sample of the general research literature for chemistry and physics.^[35]

Dale Lockard Barker’s doctoral thesis, “Characteristics of the Scientific Literature,” was quite an ambitious endeavor. The objectives of his paper were:

to identify and describe in terms of selected characteristics, the scientific literature used by Soviet chemists and to determine in part the nature of that use. Specifically, the study sought a) to establish the outstanding properties of Soviet chemical literature; b) to provide greater insight into the characteristics of Western chemical literature as reflected in Soviet use; c) to extend our knowledge of some basic properties of world scientific literature without respect to its national origins, and; d) to determine patterns of literature used by Soviet chemists.^[36]

Although Barker did not define statistical bibliography, he described what it included. In the section headed Statistical Bibliography, the author pointed out that:

the knowledge of scientific literature afforded us by descriptive and historical studies has been augmented by a considerable body of statistical research. This has been directed toward various phases of scientific communication, but has sought principally to describe the characteristics of the literature available to scientists, to identify the literature required by them, or to determine how they use the literature.^[36]

“Statistical bibliography” was used by Pritchard when he wrote “Computers, Statistical Bibliography and Abstracting Services”^[2] and again in his *Statistical Bibliography: An Interim Bibliography*, which:

contains a 700 item bibliography of literature on statistical bibliography, arranged in author order. The areas covered are: citation studies, abstracts, journals studies, direct literature studies with additional relevant material on user surveys, the history and sociology of science and citation structures. The period covered is from 1881–1969.^[3]

Alan Pritchard’s definition in the introduction to *Statistical Bibliography* is:

The statistical analysis of the means of communication in order to illuminate the processes of communication, the factors which influence them and the inter-relationships between the history and sociology of a science and the literature of the science.^[3]

In December 1969, Pritchard’s “Statistical Bibliography or Bibliometrics,” where he cited his preference of terms, appeared in print.

About a year later, in September 1970, *Research in Librarianship* published Pritchard’s document, “Computers, Bibliometrics and Abstracting Services;”^[37] Pritchard said that it and his unpublished paper, “Computers, Statistical Bibliography and Abstracting Services,” “were very similar and for practical purposes you can take it that they were the same.”^[38]

“Bibliometrics” as a term was now accepted in print (Table 1).

BIBLIOMETRICS

Alan Pritchard, who first used the word “bibliometrics,” described it as the “application of mathematics and statistical methods to books and other media of communication.”^[1] This was paraphrased by Robert A. Fairthorne as “quantitative treatment of the properties of recorded discourse and behaviour appertaining to it.”^[4] In a later

^aNumbers refer to number listing of articles in this table.

article, “Bibliometrics and Information Transfer,” Pritchard explained bibliometrics as the “‘metrology’ of the information transfer process and its purpose is analysis and control of the process.”^[39] He based his interpretation upon the fact that measurement is “the common theme through definitions and purposes of bibliometrics” and “the things that we are measuring when we carry out a bibliometric study are the process variables in the information transfer process.”^[39]

The *British Standard Glossary of Documentation of Terms* explained bibliometrics as the study of the use of documents and patterns of publication in which mathematical and statistical methods have been applied,^[40] which is basically the same as Pritchard’s original definition.

William Gray Potter, editor of the issue of *Library Trends* devoted to bibliometrics, followed suit with “Bibliometrics is, simply put, the study and measurement of the publication patterns of all forms of written communication and their authors.”^[41] In the same issue, Alvin M. Schrader said it even more simply, “Bibliometrics, [is] the scientific study of recorded discourse.”^[42]

Bibliometrics, called a quantitative science, is divided into two areas, descriptive and evaluative.

In one of these classes is included the study of the number of publications in a given field, or productivity of literature in the field for the purpose of comparing the amount of research in different countries, the amount produced during different periods, or the amount produced in different subdivisions of the field. This kind of study is made by a count of the papers, books and other writings in the field, or often by a count of those writings which have been abstracted in a specialized abstracting journal. The other...includes the study of the literature used by research workers in a given field. Such a study is often made by counting the references cited by a large number of research workers in their papers.^[43]

The two areas may also be divided as follows:

1. Productivity Count (descriptive)
 - a. Geographic (Countries)
 - b. Time periods (Eras)
 - c. Disciplines (Subjects)
2. Literature Usage Count (evaluative)
 - a. Reference
 - b. Citation^[43]

Nicholas and Ritchie divided the two groups as “those describing the characteristics or features of a literature [descriptive studies] and those examining the relationships formed between components of a literature [behavioral studies].”^[44] Although all the descriptive studies are not evaluations, all the evaluative analyses are first descriptive with the evaluative taking the data one step further, providing “data on the condition or character of the literature as a whole.”^[44]

Bibliometrics, the “science of recorded discourse”—which uses specific methodologies, mathematical and scientific, in its research—is a controlled study of communication. It is the body of a literature, a bibliography quantitatively or numerically or statistically analyzed—a statistical bibliography; a bibliography in which measurements are used to document and explain the regularity of communication phenomena.

Seminal Bibliometric Papers

For the development of a list of seminal bibliometric papers, two criteria were used: 1) did the author indicate the publication an original or; 2) did peer consensus indicate the paper “a first?”

Daniel O’Connor and Henry Voos, of the Graduate School of Library and Information Studies of Rutgers University, in the *Library Trends* 1981 Summer Issue, “Bibliometrics,” claimed “The scope of bibliometrics includes studying the relationship within a literature (e.g., citation studies) or describing a literature”^[45] focusing “on consistent patterns involving authors, monographs, journals, or subject/language.”^[45]

The paper by Cole and Eales was probably the first to give a description of a literature, using publication counts and utilizing graphic illustrations to them by year and country. “The History of Comparative Anatomy—A Statistical Analysis of the Literature”^[28] (1917), by F.J. Cole and Nellie B. Eales, has the qualifications that Hulme set forth for a statistical bibliography. It is considered a classic, being “one of the first papers based on significant statistical data.”^[46] Both Cole and Eales were scientists; F.J. Cole was a professor of zoology, and Nellie Eales was a museum curator.^[28]

Cole first attempted to “apply graphic methods to an historical study of anatomical museums” but “the number of such museums...was too small to admit of satisfactory treatment by statistical methods.”^[28] As a result, “a similar attempt on the literature of comparative anatomy” was made: “it seemed possible to reduce to geometrical form the activities of the corporate body of anatomical research, and the relative importance from time to time of each country and division of the subject.”^[28]

The report recorded publications (6,436) dealing with animal anatomy for the period 1543 to 1860,^[28] in chronological charts; the fluctuations shown were explained by miscellaneous influences. The authors admitted that no evaluation of papers was made before the counting; thus, a short paper counted the same as a lengthy one.^[28]

The Cole and Eales objectives were:

- 1) to represent by a curve the activities of comparative anatomists as a whole from the sixteenth century to 1860;
- 2) to detach from this general scheme and plot separately the performances of each European country;
- 3) to determine in a similar way which groups of animals and what

aspects of the subject engaged the attention of workers from time to time; 4) to trace the influence of contemporary events, public bodies and individuals on the history of anatomical thought.^[28]

A particularly interesting statement from the Cole and Eales publication is included here because of the noting of the occurrence by other scientists:

The steep decline after 1835 can only be explained as an admirable example of that rhythm which underlies all the activities of the living world. This primitive abhorrence of the fixed level, which finds its expression in advance or retreat, but never in stability, is just as characteristic of the work of a community as of the internal economy of the individual.^[28]

It would be very interesting to see an update of this paper from 1850 to check on the possible continuance of the Cole and Eales findings.

The second paper of importance is that of E. Wyndham Hulme;^[15] it too is an historical publication count and is considered “one of the first analytical accounts of the growth of the literature.”^[44]

Hulme used 13 annual issues of *The International Catalogue of Scientific Literature*, from 1901 to 1913, counting author entries for various subjects and graphing the information. Because of declines and advances evidenced in the chart he did a further analysis resulting in the tabulation of the “Number of Journals Indexed arranged by Countries”^[15] and listing of countries in order of total productivity of the number of journals indexed.^[15]

Wyndham Hulme wrote “Bibliography is the science which collects, preserves, describes and classifies.”^[15] He was an advocate of books being universally classified, then put in chronological order in each class, the result of which, he believed, “presents for each period a bibliographical counterpart of the corresponding growth of the activities of the human mind.”^[15] In other words, Hulme believed that the chronological order of classified books would show the growth or development of a subject science, or important movements in history.

The purpose of his paper was to “ascertain and illustrate by bibliographical data, various stages in the development of the mechanics of civilization.”^[15] “I deal with it [civilization] as an organic growth so far as this growth can be correlated with the recorded intellectual activities of the several periods.”^[15] He was not as concerned with numbers as with specialization, for he was certain a sign of subject division was a sign of growth. Hulme wished to emphasize that “phases of activity and retardation in each science” could be shown by statistical treatment and that the time a science would reach its boundaries might also be indicated.^[15] He gave three requirements for such statistics (which he believed were practically nonexistent):

1) the statistics must be international in scope and sufficiently extended for the purpose in view; 2) original work must be distinguished from educational literature; 3) the statistician must possess a competent knowledge of his subject matter.^[15]

Hulme also stated “increased activity in the library output of a science can invariably be associated with pre-existent causes,”^[15] concluding that declines and peaks are influenced by population change, political, and economic movements.^[15]

Cole and Eales said something of the same when they decided that an increase of anatomical publications from 1650 to 1700 and a decline from 1700 to 1750 were due to the number of anatomists being born between 1600 and 1650 followed by a birth decline, to the founding of important scientific societies from about 1652 to 1666, and to the beginning of periodical publications.^[28]

One item of note is the suggestion that a sharp decline after 1835 may have been due to “the rise of histology and embryology subsequent to the enunciation of the Cell Theory in 1838–9.”^[28] This sounds like Hulme’s idea mentioned earlier, that specialization shows growth.

Hulsey Cason and Marcella Lubotsky published a study, “The Influence and Dependence of Psychological Journals on Each Other,” in 1936.^[47] It was cited by Francis Narin in his study *Evaluative Bibliometrics*^[48] for its “Journal to Journal Cross Citation Influence for Journals and Fields.”^[48]

The purpose of the paper was “to secure a quantitative measure of the extent to which each psychological field influences and is influenced by each of the other psychological fields,”^[47] with the study being limited to journals published in the English language in 1933.^[47] The method used was a listing of 61 tentative journals in a survey letter sent to 54 psychologists; they received replies from 45, of which 39 were usable. Ultimately, only 28 journals were used; others were eliminated for various reasons. The specifically different references in the bibliographies, references, and footnotes of each article in each periodical were used.^[47]

For the 1933 part of each journal, we counted the number of references 1) to the same journal; 2) to each of the other journals listed in Table 1 [list of 28 journals]; and 3) to all other references including books, monographs, and journals not listed in Table 1.^[47]

Narin believed Cason and Lubotsky’s:

real advance lies in the idea of constructing a cross-citing network. They summarized their data by constructing a 28 × 28 element table of the percent of references from each of the most significant journals to the others, with a summarized count of references to other publications. This seems to be the first time that the idea of a cross-citing network appears in the literature.^[48]

The Cason and Lubotsky article should be mentioned even though the suggestions presented in it did not flourish.

In 1926 the *Journal of the Washington Academy of Sciences* printed the paper “Statistics—The Frequency Distribution of Scientific Productivity.”^[49] It was especially important because it developed a productivity formula which became known as Lotka’s Law.

Alfred J. Lotka, a statistician with the Metropolitan Life Insurance Company, thinking it “would be of interest to determine, if possible, the part which men of different calibre contribute to the progress of science,”^[49] developed a listing of A and B names (6891) from the *Chemical Abstracts Index* of 1907–1916 and the corresponding number of papers each produced. The same procedure, but using complete coverage, was applied to Auerbach’s *Geschichtstafeln der Physik* through the year 1900.^[49] From these data, Lotka formulated a general equation: “the relation . . . between the frequency y of persons making x contributions is $x^n y = \text{const.}$ ”^[49] He then found the value of the constant when $n = 2$; this ultimately became known as the inverse square law of scientific productivity, explained as follows:

In the cases examined it is found that the number of persons making 2 contributions is about one-fourth of those making one; the number making 3 contributions is about one-ninth, etc.; the number making n contributions is about $\frac{1}{n^2}$ of those making one; and the proportion, of all contributors, that make a single contribution, is about 60 per cent.^[49]

The results were publicized in June of 1926 and have had quite an impact on a number of investigations by stimulating further analysis, controversy and research. (See further discussion of Lotka’s Law in the next section.)

The major step of analyzing citations, as opposed to publications, was taken by Gross and Gross in 1927, when they discussed the purchase of journals for a chemical library in terms of a tabulation of citations from the *Journal of the American Chemical Society*.^[46]

Paul L.K. Gross and E.M. Gross, a husband and wife team, wrote a paper tackling the problem of colleges presenting “broad cultural education” without neglecting preparation for the increasing competitive demands of graduate schools. The Grosses were concerned about the preparation of graduates from small colleges who wanted to enter graduate competition and believed that some periodicals were more conducive to success than others in preparing students for advanced work.^[50] On the basis of the idea that lists or files of scientific periodicals were of utmost importance in solving such a problem, Gross and Gross “decided to tabulate the references in a single volume of the *Journal of the American Chemical Society*”

chosen “as the most representative of American chemistry.”^[50] The result was 3633 references for 247 different periodicals or journals.^[50] The tabulations were made for 5-year periods from 1871 to 1925 as found in the 1926 volume, and trends were traced from the tabulations. From these trends, need for specific periodicals was decided, which included not only specific subject journals but also some from related fields.^[50] “This is the first recorded study based on counting and analyzing citations, i.e., citation analysis”^[51] and has been a model for many investigations.

In late 1927, P.L.K. Gross wrote “Fundamental Science and War,”^[52] in which he claimed, “the process of laying this foundation [science progresses only after the foundation stones of pure science have been firmly laid] consists in searching out, correlating and classifying knowledge.”^[52] Gross again used citations to support his conclusions, this time as to the effect of war on the science of chemistry. In Gross’s words:

Consideration of the method of investigation [citation counts] here employed will show that we are concerned not merely with the quantity of work published during this period (1912–1923), but that in reality we are concerned only with the good work, the work which has survived and which has proved of value to the investigators who followed. The method, therefore, has a distinct advantage over any method which counts pages or number of papers published in various journals for its basis of comparison.^[52]

In other words, papers which are continually cited are the most valuable for researchers, according to Gross.

Samuel Clement Bradford, another pioneer of bibliometrics, should be considered for his special article “Sources of Information on Specific Subjects,”^[53] which is the first paper published on observations on scattering. This important paper contains Bradford’s law, which many scientists have used in research. Upon investigating “300 abstracting and indexing journals,”^[53] Bradford found that of 750,000 articles, “only 250,000 different articles are dealt with and 500,000 are missed.”^[53] This disturbed him greatly, true librarian that he was, and he believed repetition would be eliminated if there were a standard classification adopted internationally to bring references to the same subject together. This would be a cooperative endeavor.

Based on data collected by E. Lancaster Jones of the Science Library from the bibliographies of *Applied Geophysics* (1928–1931) and *Lubrication* (1931–1932 plus),^[53] a hypothesis was established: “to a considerable extent, the references are scattered throughout all periodicals with a frequency approximately related inversely to the scope.”^[53] Using this observation, Bradford proceeded to analyze his data to develop a means by which librarians could select the most usable periodicals. He found when the journals were divided into zones, each containing the

same number of articles as a nucleus, the relation of the number of journals was $1: n: n^2$.^[53] In his words:

the law of distribution of papers on a given subject in scientific periodicals may thus be stated: if scientific journals are arranged in order of decreasing productivity of articles on a given subject, they may be divided into a nucleus of periodicals more particularly devoted to the subject and several groups of zones containing the same number of articles as the nucleus, when the numbers of periodicals in the nucleus and succeeding zones will be as $1: n: n^2$.^[53]

The next scientist to incite thought and controversy in the area of “bibliometrics” is George Kingsley Zipf. Zipf’s law is considered a bibliometric law and has been used in many bibliometric papers.

Zipf’s book *Psycho-Biology of Language*,^[54] published in 1935, has in its Preface the kernel of what later was called Zipf’s law.

If the number of different words occurring once in a given sample is taken as x , the number of different words occurring twice, three times, four times, n times, in the same sample, is respectively $\frac{1}{2^2}$, $\frac{1}{3^2}$, $\frac{1}{4^2}$, $\dots$, $\frac{1}{n^2}$ of x , up to, though not including, the few most frequently used words; that is, we find an unmistakable progression according to the inverse square, valid for well over 95% of all the different words used in the sample.^[54]

From this beginning, Zipf developed a formula, $ab^2 = k$, where a is the number of words occurring b times. He also concluded the “ $ab^2 = k$ relationship is valid only for the less frequently occurring words which, however, represent the greater part of the vocabulary in use, though not always a great majority of occurrences,”^[54] but “it is in the frequency distribution of the rarer words that we find the closest approximation to the $ab^2 = k$ relationship.”^[54]

It is important to note here that Zipf, in his book *Human Behavior and the Principle of Least Effort*,^[55] cited J.B. Estoup for word usage frequency by stating,

The first person (to my knowledge) to note the hyperbolic nature of the frequency of word usage was the French stenographer J.B. Estoup who made statistical studies of French, cf. his *Gammes Stenographiques*, Paris 4 ed., 1916 (have not seen his earlier editions).^[55]

Fussler’s paper, as noted earlier, is another classic in the history of bibliometrics^[35] and is composed of two parts: the first discusses “the importance of the literature of various subject fields to research in chemistry and physics,”^[35] and the second, “the temporal span of the literature, the principal forms of the literature, the national origins of the literature used in the United States, and some attention is devoted to the more important serial titles.”^[35] Because of various problems facing research

libraries, Fussler believed it important to do a study to find the “more fundamental characteristics of the literature used by research personnel of the United States in two related subject fields—chemistry and physics.”^[35]

He planned a modification of the technique of reference listing. Using the *Physical Review* and the *Journal of the American Chemical Society* as key journals of the individual disciplines, for the years 1899, 1919, and 1939, frequency lists of samples of cited titles were made, and lists of source journals were developed.^[35] The idea of using “key” journals to determine a frequency citation list which in turn gave a group of source journals was new,^[35] although Fussler admitted his general procedure, that of listing and analyzing references, was not new.^[35] Fussler’s study differed mainly in the method of selecting the source journals.^[48]

His investigations led him to conclude:

the distribution of literature, as revealed in the study, indicates that provision of a substantial proportion of the references in a research field is possible through a small number of journals if they are properly selected but that the provision of the entire necessary research literature for a field will require a very large number of titles, many of which will be needed elsewhere in a university or in a large research organization.^[35]

Because of the interrelationship of various disciplines, there is a “network of joint use of research materials”^[35] not necessarily based on the classification scheme.

One item of special note is Fussler’s comment about literature characteristics wherein he suggested that those of a particular sector of a discipline may differ noticeably from those of a whole field.^[35]

The first presentation of “impact factor” was in 1955 in “Citation Indexes for Science” by Eugene Garfield.^[56] Garfield was aroused by the quote of P. Thomasson and J. C. Stanley:

The uncritical citation of disputed data by a writer, whether it be deliberate or not, is a serious matter. Of course, knowingly propagandizing unsubstantiated claims is particularly abhorrent, but just as many naive students may be swayed by unfounded assertions presented by a writer who is unaware of the criticisms. Buried in scholarly journals, critical notes are increasingly likely to be overlooked with the passage of time, while the studies to which they pertain, having been reported more widely, are apt to be rediscovered.^[57]

Hoping to “eliminate the uncritical citation of fraudulent, incomplete, or obsolete data by making it possible for the conscientious scholar to be aware of criticisms of earlier papers,” Garfield developed a plan for “a citation index that offers a new approach to subject control of the literature of science. . . best described as an association-of-ideas index.”^[56] He concluded that a basic difficulty was

to build a subject index which included all possible synonyms, and that “bibliographic tools” were needed to help bridge the subject gap between source and receiver, authors and information-seeking scientists.^[56]

Garfield invented “a citation code for science.”^[56] This code was made up of two parts, “a serial number...to identify each periodical” and a “serial number, assigned to each article in a particular publication.”^[56] The citation index would have these characteristics:

A complete alphabetic listing of all periodicals covered, in addition to the code number for each periodical...would list in straight numerical order the code numbers for all the articles covered...code numbers representing articles that had referred to the article in question would be listed under each code number.^[56]

“The system would provide a complete listing, for the publications covered, of all the original articles that had referred to the article in question,” being especially “useful in historical research, when one is trying to evaluate the significance of a particular work and its impact on the literature and thinking of the period.”^[56] The influence of an article, Garfield named “its ‘impact factor’.”^[56]

Garfield’s “Citation Analysis as a Tool in Journal Evaluation,” subtitled, “journals can be ranked by frequency and impact of citations for science policy studies” appeared in 1972.^[58] Narin claimed it “is a milestone in the field”^[48] for this reason. “There are more data covering more citations to more journals in that one paper than there had been in all the scientific literature up to that time.”^[48] Problems, of course, exist: abbreviated titles standing for more than one journal title, changes in format of journals such as mergers or splits, and changes in journal titles for special issues.^[56] But Garfield claimed:

It is apparent...that a good multidisciplinary journal collection need contain no more than a few hundred titles. That is not to say that larger collections cannot be justified, but it does say something indisputable, in terms of cost and benefit, about how large a journal collection need be (or how small it can be) if it is to provide effective coverage of the literature most used by research scientists.^[56]

Using much data from his *Science Citation Index*, Garfield made numerous observations: “majority of all references cite relatively few journals,”^[56] “the average paper is cited only 1.7 times a year,”^[56] “predominance of a small group of journals in the citation network has been confirmed,”^[56] “half of all articles published cite at least one of the 25 most frequently cited journals at least once,”^[56] “predominance of cores of journals is ubiquitous,”^[56] and “most frequently cited journals...are (usually) most productive in terms of articles published.”^[56] All of this led him to state, “I can with confidence

generalize Bradford’s bibliographic law concerning the concentration and dispersion of the literature of individual disciplines and specialties.”^[56]

What about journals which rank low on a “times-cited” list? According to Garfield, although “citation frequency reflects a journal’s value and the use made of it,”^[56] low-ranking journals may also be used “for some purpose other than the communication of original research findings.”^[56]

In this article, Garfield also explained how his relative impact factor was determined:

by dividing the number of times a journal has been cited by the number of articles it has published during some specific period of time. The journal impact factor will thus reflect an average citation rate per published article.^[56]

In 1961, M.M. Kessler did a report on “bibliographic coupling” for MIT. This report, revised in 1962, was later published in *IEEE Transactions on Information Theory* of January 1963.^[59] The paper, “An Experimental Study of Bibliographic Coupling Between Technical Papers,” was described by Kessler as “one of several pilot studies designed to test an hypothesis.”^[59] Having been suggested three years earlier, the hypothesis was basically “that a number of scientific papers bear a meaningful relation to each other (they are coupled) when they have one or more references in common.”^[59]

In August 1962, Kessler sent his article “Bibliographic Coupling between Scientific Papers”^[60] to the publishers of *American Documentation*; it was printed in January 1965. In 1974, Bella Hass Weinberg reviewed the subject and referred to this paper by Kessler as “the classic paper in bibliographic coupling.”^[61]

Kessler stated that bibliographic coupling is “a new method for grouping technical and scientific papers,”^[59] with the essential facts of the method being:

- A single item of reference used by two papers is called one unit of coupling between them.
- A number of papers constitute a related group, G_A , if each member of the group has at least one coupling unit to a given test paper P_0 .
- The coupling strength between P_0 and any member of G_A is measured by the number of coupling units (n) between them.^[62]

He also explained that:

This method was called “Bibliographic Coupling” because it originated in the hypothesis that the bibliography of technical papers is one way by which the author can indicate the intellectual environment within which he operates, and if two papers show similar bibliographies, there is an implied relation between them.^[62]

Based on the unit of coupling (a single item of reference used by two papers), two criteria of coupling, A and

B , are defined. Criterion A includes b) and c) in the foregoing list. An example of G_A would be:

where P_0 is the test paper, and A , B , and C are members of G_A .

Criterion B contains related group G_B if each member is connected with every other member by at least one coupling unit. An example of G_B would be:

where A , B , and C are members of G_B .^[60]

Although, at the time of his report, Kessler was further investigating his method, he listed five bibliographic coupling properties:

1. It is independent of words and language. All the processing is done in terms of numbers. We thus avoid all the difficulties of language, syntax and word habits.
2. No expert reading or judgment is required. Indeed, the text need not be available.
3. The group of papers associated with a given test paper extends into the past as well as the future.
4. The method does not produce a static classification or permanent index number for a given paper. The grouping will undergo changes that reflect the current usages and interests of the scientific community.
5. The member papers of a G_A may be considered as the "logical references" of P_0 . A population of papers, P_m may thus be produced in such a way that for each paper in P_m we substitute the members of its G_A for the actual references. (That is, replace the actual references of the paper by its logical references.) This population of papers may then be further processed according to Criterion A . The significance of this logic is being investigated.^[60]

To secure data, Kessler had a computer program written, processing 137,000 references obtained from 8,521 articles in 36 volumes of the *Physical Review*. Because of the overabundance of material, it was decided to use Volume 97 only, creating 265 G_{As} .^[60] The variance of the number of articles in each G_A was 0 to 27, with the variance of coupling units from 1 to 7.^[60] Bibliographic coupling, at the present time, is recognized as a technique "effective in identifying related papers,"^[48] but more analysis is needed to interpret the relationship.

Although the "epidemic theory" itself is not bibliometric, it can be in its application. Robert Kenneth Dikeman used the epidemic theory model in his

dissertation, "On the Relationship between the Epidemic Theory and the Bradford Law of Dispersion,"^[63] J.J. Hubert included it in his "Bibliometric Models for Journal Productivity,"^[64] and Dennis B. Worthen made a comparison of it in his "The Epidemic Process and the Contagion Model."^[65]

The original report, "A Generalization of the Theory of Epidemics: An Application to the Transmission of Ideas," by William Goffman and Vaun A. Newill,^[66] is included in this group of original idea papers because it is antecedent to a large portion of the bibliometric research of Goffman and his colleagues^[67-70] and can be considered fundamental.

Publicized ideas have been the forerunner of many scientific developments, and Goffman and Newill's innovative suggestion of the model of the theory of epidemics is really basic to the study of idea development. It is not a technique such as bibliometric coupling and cocitation which are used in the analysis of the structure of literature. The epidemic theory is a technique explaining the transmission of ideas by means of the literature. In other words, an "infectious disease epidemic" is compared to an "intellectual epidemic," where the germ or virus is analogous to an idea, the "case of disease" analogous to the "author of paper" or the "paper containing useful ideas," the susceptible person to the "reader of paper" or "all papers containing potentially useful ideas," "death or immunity" to "death or loss of interest," or "deletion or loss."^[66]

The purpose of this "epidemic theory report" was "to help to describe the publication activity within a given discipline"^[66] to determine the necessity for an information retrieval system.

As explained by the authors, an epidemic process needs: "1) A specified population; [and] 2) An exposure to infectious material,"^[66] with the population divided into three categories at a given time:

- a) *Infectives*: Those members of the population who are host to the infectious material.
- b) *Susceptibles*: Those members of the population who can become infectives given effective contact with infectious material.
- c) *Removals*: Those members of the population who have been removed from circulation for one of a variety of reasons.^[66]

A possible example would be: If a third paper C cites papers A and B (which are then bibliographically coupled), it can be said that C was susceptible to the infectious material (idea) from infectives A and B , and because A and B are coupled, A could be considered a catalyst of B , and B the same of A . Example:

This analogy can also be applied to clusters of papers: an original paper is the infective, and papers that cite the original are susceptibles. For example:

Cluster of papers

One last note: If “in general, the epidemic process can be characterized as one of transition from one state...to another,”^[66] a scientific front and an epidemic are closely related, for a scientific front is also an indication of a change.”^{[66][65]}

The next article in the chronological arrangement of papers is that of Alan Pritchard who advocates the use of the new word “bibliometrics” in place of “statistical bibliography,” already mentioned in the first section.

Another innovative paper, this one on analysis of citations, was presented by Henry Small. Small proposed a new method of analyzing citations in 1973 in the first of a group of articles bearing on the subject cocitation. In this article, “Co-Citation in the Scientific Literature: A New Measure of the Relationship between Two Documents,”^[71] Small explained his subject as follows:

Bibliographic citations in scientific papers have been used by a variety of researchers to establish relationships among documents. Both direct citation—the citing of an earlier document by a new document—and bibliographic coupling—the sharing of one or more references by two documents—have received considerable attention. A related measure, which has been overlooked in earlier discussions, is co-citation. Unlike bibliographic coupling which links source documents, co-citation links cited documents and is, therefore, analogous to a measure of descriptor or word association. The purpose of this paper is to define this new kind of “coupling” and to distinguish it from bibliographic coupling, using an actual example from the literature of physics. Co-citation patterns are found to differ significantly from bibliographic coupling patterns, but to agree generally with patterns of direct citation.^[71]

Because “Co-citation is the frequency with which two items of earlier literature are cited together by the later literature,”^[71] the number of times that papers are cited together by a new or later document gives the strength of the cocitation. For comparison, bibliographic coupling, depending “on references contained in the coupled documents” is a set or permanent relation, whereas in the case of cocitation, “patterns change as the interests and intellectual patterns of the field change.”^[71]

Assuming that the main ideas and the experiments supporting them are in the frequently cited papers, then cocitation “can be used to map out in great detail the relationships between these key ideas.”^[71] Cocitation can also be used to depict a literature specialty core or cluster.^[71]

Small concluded:

The pattern of linkages among key papers established a structure or map for the specialty which may then be observed to change through time. Through the study of these changing structures, co-citation provides a tool for monitoring the development of scientific fields, and for assessing the degree of interrelationship among specialties.^[71]

The preceding information led to the listings found in Table 2. Historically, the Hulme paper was first in the presentation and application of the term “statistical bibliography.” Hulme cited the Cole and Eales publication which was the first to use a publication count by country. Gross and Gross, first to consider the structure of literature, used a citation count technique to make an evaluation. Fussler was the first to develop a different method of selecting source journals for data. Garfield was the first to use an “impact factor” in citation analysis. Kessler cited his paper as the introduction of bibliographic coupling. Goffman and Newill were the first to apply the theory of epidemics to the field of literature. Small introduced the technique of cocitation. Pritchard coined the word “bibliometrics.” The identification of the first papers of Bradford and Lotka to present their laws was easy; the identification of the first paper to present Zipf’s law required more searching; the law was found in the preface of one of his books.

Since the 1973 paper of Small, there does not seem to have been any basically new idea presented; the many publications since then are variations, applications and/or extensions of the original hypotheses, laws, or techniques.

Empirical Laws of Bibliometrics

One of the principal aims of Science is to trace, amidst the tangled complex of the external world, the operation of what are called “laws”—to interpret a multiplicity of natural phenomena in terms of a few fundamental principles.^[18]

Natural laws describe patterns which are regular and recurring. The scientific point of a law is twofold. First, a concrete statement of a law may give us the ability to better predict events or to shape our reactions to them. Second, a physical law may help in the development of theories which explains why a particular pattern occurs.^[72]

Table 2 Chronological list of seminal papers.

Year	Author(s)	Title	Historical significance
1917	Cole, F.J., and Nellie B. Eales	"History of Comparative Anatomy"	First publication count, by country, 1843–1860
1923	Hulme, E. Wyndham	<i>Statistical Bibliography in Relation to the Growth of Modern Civilization</i>	Term "statistical bibliography" first used
1926	Lotka, Alfred J.	"Frequency Distribution of Scientific Productivity"	Inverse square law, relation of authors to papers
1927	Gross, Paul L.K., and E.M. Gross	"College Libraries and Chemical Education"	Citation count technique
1934	Bradford, Samuel C.	"Sources of Information on Specific Subjects"	Scattering observations published
1935	Zipf, George K.	<i>Psycho-Biology of Language</i>	Word rank-frequency distribution
1949	Fussler, Herman H.	"Characteristics of the Research Literature used by Chemists and Physicists in the U.S."	First to use journal references to develop a core of journals in a field
1955	Garfield, Eugene	"Citation Indexes for Science"	Term "impact factor" first used
1963	Kessler, M.M.	"Bibliographic Coupling between Scientific Papers"	Introduced bibliographic coupling
1964	Goffman, William, and Vaun Newill	"Generalization of Epidemic Theory: An Application to the Transmission of Ideas"	Epidemic theory applied to literature growth
1969	Pritchard, Alan	"Statistical Bibliography or Bibliometrics?"	Word "bibliometrics" introduced
1973	Small, Henry	"Co-Citation in the Scientific Literature: A Measure of the Relationship between Two Documents"	Introduced cocitation

This was emphasized in the work of Pranas Zunde and John Gehl,^[73] where they wrote that it is important not only to describe the phenomena of a science but to try to establish tenets to explain and predict the phenomena.^[73]

Abraham Bookstein has set specifications for laws.

When a new law is proposed, it may be reasonable to demand of it, on intuitive grounds, that it remain true under a variety of circumstances differing from those in which it was discovered. Should it satisfy these demands, we may increase the validity of the law; if it does not, and yet we still wish to maintain the validity of the law, we ought to feel an obligation to explain the discrepancy.^[74]

Three regularities occur in bibliometrics to which have been given the name "law": Lotka's Law of Scientific Productivity (authors publishing in a certain discipline), Bradford's Law of Scattering (distribution of publications), and Zipf's Law of Word Occurrence (ranking of word frequency).^[75] Although claims have been made that the three laws are basically the same, one of their differences lies in the type of data. Lotka's law dealt with authors publishing and the number of papers published; Bradford observed the scattering of articles on specific subjects in various journals; Zipf counted frequencies of words. "Each of these distributions was empirically derived," and they "are similar to each other as special cases of a hyperbolic distribution."^[76] Although many and various proofs have been offered by important scientists supporting the theory of relatedness and similarity of these "laws,"^[4,77] the reader is advised to keep John Hubert's comment in mind: "literature" contains many models, and some are erroneously referred to as "laws" as if they predicted occurrences without error."^[78]

In this section, each law is analyzed from the viewpoint of its literature, and some of the literature of the three empirical laws explaining each one's importance is noted.

LOTKA'S LAW OF SCIENTIFIC PRODUCTIVITY

Alfred J. Lotka was a mathematician, supervisor of mathematical research in the Statistical Bureau of the Metropolitan Life Insurance Company from 1924 to 1933.^[79] It was during this time, 1926, that his definitive work, later called Lotka's law was produced.^[49] His investigation was a productivity analysis (described in the preceding section). Counting names and the number of publications listed for each, the coverage was for only *A* and *B* names in *Chemical Abstracts* for 1907 to 1916 and for Auerbach's *Geschichtstafeln der Physik* from its beginning through 1900.^[49] The data were tabulated and plotted, from which Lotka developed a "general formula for the relation. . . between the frequency *y* of persons making *x* contributions" as " $x^n y = \text{const.}$ "^[49]

Finding the value of the constant when $n = 2$, he observed that:

the number of persons making 2 contributions is about one-fourth of those making one; the number making 3 contributions is about one-ninth, etc.; the number making *n* contributions is about $\frac{1}{n^2}$ of those making one, and the proportion, of all contributors, that make a single contribution, is about 60 per cent.^[49]

Notice that Lotka's observation deals with the least number of productions.

Since the publication of Lotka's original article in 1926, much research has been done on author productivity in various subject fields. The publications arising from this research have come to be associated with Lotka's work and are often cited as proving or supporting his findings. However, a review of this literature reveals that Lotka's article was not cited until 1941, that his distribution was not termed "Lotka's law" until 1949, and that no attempts were made to test the applicability of Lotka's law to other disciplines until 1973.^[80]

In that year Murphy did his study of "Lotka's Law in the Humanities."^[81]

Larry J. Murphy chose for his work the first decade of the publication (on history of technology) *Technology and Culture*^[81] and found "the actual number of single authors" to be 130.^[81] He rounded off his numbers and plotted the results, leading him to conclude, without any statistical test for goodness of fit, that "The tabulation essentially verifies that Lotka's Law applies to this field within the humanities."^[81] There was an error in Murphy's graph which was noted and corrected in a letter to the editor.^[82]

In 1977 John J. Hubert, in a letter to the editor of the *Journal of the American Society for Information Science*, evaluated Murphy's work with the χ^2 goodness of fit test.^[83] His conclusion was, "By using an exact interpretation of the law and by applying a valid statistical test, it can be shown that this data does not follow Lotka's law."^[83] Russell C. Coile also did an evaluation of the Murphy results,^[84] and he too found that Lotka's law did not apply to the particular sample of authors.^[84]

Henry Voos, in 1974, measured the productivity of authors in the field of information science and compared his results with Lotka's observation.^[85] Using all the articles indexed in *Information Science Abstracts* from 1966 to 1970 for his data, he made a rank-frequency listing of all the authors and their articles by year.^[85] Voos "found that the relationship for information science seems to be $1/n^{3.5}$ instead of Lotka's $1/n^2$,"^[85] and instead of Lotka's 60% producing one paper, "in information science the figure tends to be 88% writing only one paper."^[85] The results of using the χ^2 test show "one can be more than 95% certain that the actual population fits the theoretical distribution."^[85]

Coile wrote a criticism of the Voos work, making suggestions and corrections.^[86] Voos responded with a revised chart, a promise for further research, and an apology.^[85]

Next to apply Lotka's law to various subjects was Alan Edward Schorr.^[87] He published his first application study in the fall of 1974 in conjunction with library science and used for data *Library Quarterly* and *College and Research Libraries* from 1963 to 1972.^[87] His analysis indicated that "It is clear that Lotka's Law does not apply to the field of library science, where four-fifths of all papers represent the only contribution of an individual."^[87] Schorr suggested:

for library science literature, scholarly production would follow an inverse quadruple power law ($\frac{1}{n^4}$) whereby for each 100 contributors of single articles, about 6 will contribute two articles, about 1 will contribute three articles, and almost no writers would provide four articles or more.^[87]

A scathing letter by Dean Tudor, chairman of the Library Arts Department of Ryerson Polytechnical Institute regarding Schorr's "Lotka's Law and Library Science" was soon received by the editor of *RQ*.^[88] Tudor called it "frivolous bagatelle occupying two pages of space that could be better put elsewhere,"^[88] but he did pose some interesting questions, including "is Lotka's Law still valid almost fifty years later?"^[88] Alan Schorr retaliated, but with a very carefully worded and explanatory letter.^[89]

In the spring of 1975, Schorr's "Lotka's Law and Map Librarianship,"^[90] based on his own map librarianship bibliography,^[91] was published. "Because it appears that the results do not support the inverse square law, a chi-square test was applied,"^[90] and conclusions were drawn that "Lotka's Law holds true for the field of map librarianship."^[90]

This time Russell Coile reacted to Schorr's work, writing "this conclusion is not true when the correct data is tested with an appropriate goodness-of-fit test"^[84] and suggested, after his own calculations were made, that "it would appear that Lotka's law does not apply to this field of map librarianship."^[84]

Schorr did one more test with Lotka's law, producing the paper "Lotka's law and the History of Legal Medicine,"^[92] the data being secured from *International Bibliography of the History of Legal Medicine*.^[93] Schorr found:

Authors with multiple contributions fall below the numbers expected by Lotka's Law (e.g., authors with two publications account for 18.1% of single author entries instead of 25%; authors with five publications comprise 1.8% instead of 4%)...The results do not support the inverse square law and thus Lotka's Law does not hold true for the history of legal medicine.^[92]

"To test for validity a chi-square test was applied... Lotka's Law is not applicable to this discipline."^[92]

T. Radhakrishnan and R. Kernizan reported their "experiment to verify the satisfaction of Lotka's law, with the papers published in the area of computer science,"^[94] in the article, "Lotka's Law and Computer Science Literature."

In a convenient machine-readable form we had with us the bibliographic details of the papers published during the years 1968 to 1972 in *Communications of the Association for Computing Machinery* (CACM) and in the *Journal of the ACM* (JACM).^[94]

It was decided to use this information in an attempt to verify Lotka's law. In their first experiment, the assumption was made that "an author publishes exclusively through one scientific journal," but it was found that this assumption was not valid. "From the chi-squared values it is clear that Lotka's original suggestion of x/n^2 does not apply very well. However, the prediction by x/n^3 is quite close."^[94] "In the second experiment we considered all the papers published by the authors irrespective of the journal."^[94] A random selection of authors was made using the cumulative author of *Computer and Control Abstracts* and was repeated with JACM. The deviation from Lotka's Law was high.^[94]

In the judgment of the authors:

1) Lotka's law, in its generalized form, seems applicable when we consider the publications of authors in one periodical; and 2) when we consider all the publications of the authors in various journals, the observed values deviate considerably from the predictions of the law. This may be due to the differences between pure and applied science.^[94]

They suggested further testing the law using "the service tapes such as Engineering Index, INSPEC, etc."^[94]

Two more papers testing the law in 1981 are here mentioned. K. Subramanyan did a study with library literature,^[95] and Valerie L. Richardson^[96] collected data from the "catalogue at State College of Victoria at Frankston."^[96] Subramanyan found that the pattern did not conform to Lotka's results and suggested more work be done.^[95]

Richardson stated that from her investigation, "It can be seen that the Frankston data do fit Lotka's law in its general form, but since the slope of the Frankston line is greater than 2, the data do not correspond to the inverse square law."^[96]

The compilation "Frequency Distributions of Scientific Performance: A Bibliography of Lotka's Law and Related Phenomena," by Jan Vlachy,^[97] although not a substantive work, is included here because of its excellence. This bibliography of 437 papers^[97] is international for it lists articles in English, from England, Canada, and the United States; and in Czech, Russian, Danish, French, and German. Lotka, Bradford, and Zipf are included as well as many other areas of bibliometrics. (An interesting note: Here was found the second reference to the Estoup book.)^[97]

Attention should be drawn to several items of importance: In Lotka's investigation, "Joint contributions have in all cases been credited to the senior author only,"^[49] whereas some of the studies counted each contributing author separately. This could make a difference in the resultant statistics. The number of names used may have influenced the outcome; Lotka use 6819 and 1325,^[49] other studies, many less; Murphy, for instance, used 130.

The time period is another variable that may have affected outcomes. Lotka's *Auerbach* data covered a complete history—and the data fit; his *Chemical Abstracts* statistics covered a 10-year period—and the data did not fit.^[49]

Miranda Lee Pao summed up the prevalent problems neatly:

Several studies have assumed the inverse square relation as the basis for testing. Others derived the value of the constant c from the percentage of single paper contributors. None of these assumptions can be traced back to Lotka.^[98]

Her deduction is well taken,

Therefore, a uniform method should be agreed upon by those attempting such a test. Comparison and generalization on author productivity may be possible only if compatible data are available and results are significant.^[98]

An added note about Lotka. At Johns Hopkins University at the invitation of the Department of Biometry and Vital Statistics, Alfred J. Lotka finished his book *Elements of Physical Biology*, started in 1902 and published in 1925.^[99] In the book, Lotka discussed the work of C.J. Willis, who developed a biological theory of age and area,^[100] and the extract following seems to be especially interesting.

Turning from the theoretical and debatable portion of Dr. Willis' contribution, to the factual material presented by him, we are confronted by a number of very remarkable relations. . . [The] ordinates represent the number of genera in the several natural families of plants and animals indicated, and the corresponding abscissae represent the number of species in each genus plotted. So. . . of the family Compositae 1143 genera were noted as follows:

446 genera of 1 species
140 genera of 2 species
97 genera of 3 species
43 genera of 4 species
55 genera of 5 species
etc.

...the monotypic genera, with one species each, are always the most numerous, commonly forming about one third of the whole group; the ditypics, with two species each, are next in frequency, genera with higher numbers of species becoming successively fewer. . . Perhaps more striking still is the relation established in figures 64, 65, and 66. [These figures are graphs wherein relations between number and size are plotted logarithmically.] The quantities plotted here are of the same character as in figure 63, [these are hyperbolic curves] but they are plotted on a double logarithmic scale, with the remarkable result that the graphs obtained are in close approximation straight lines. Thus if x denotes the number of species in a

genus, and y denotes the number of genera comprising x species, we have $\log x + a \log y - b = 0$ or

$$xy^a = \text{const.}$$

that is to say, the variables x and y are connected by a hyperbolic relation. It should be noted that this relation covers a wide variety of cases, including both plants and animals.^[99]

This seems very familiar when we realize Lotka's "general formula for the relation . . . between the frequency y of persons making x contributions is $x^ny = \text{const.}$ "^[49] and when his data are arranged as the Willis genera and species information.^[49]

Frequency of persons (Genera)	Contributions (Species)
3991	1
1059	2
493	3
287	4
184	5

Is it possible that Lotka's idea for his "productivity law" was suggested by Willis's investigations?

BRADFORD'S LAW OF SCATTERING

Part I

That Samuel Clement Bradford was a very determined and dedicated person is very evident in his writing. His thinking was undoubtedly influenced by Paul Otlet and LaFontaine, who organized the First International Conference on Bibliography held in Brussels in 1895.^[101] The theme of the conference was the need for international cooperation to develop a universal index which would recognize the requirement of a standard subject classification to be backed by a central universal library. This idea was staunchly supported by Bradford, as shown in the following.

In 1927 "Bibliography by Cooperation" appeared in *Library Association Record* (LAR). Here Bradford indicated his concern for the accelerating accumulation of "useful scientific and technical literature"^[102] and reiterated the need for "bibliographical work . . . [to] be brought together"^[102] by the use of one system of classification "as an index to all the papers that relate to a particular subject of study, no matter when they were written."^[102] Because "Every bureau indexes or abstracts papers that are done by other bureaux, and only a portion of the literature is covered,"^[102] he believed a universal classification system would eliminate repetition or classifying the same articles, use items not cataloged, and thereby save time, information, and money, and give better service.

He included in his paper a list of science subjects and the number of bibliographic references for each^[102] to alert readers as to what the Science Library, of which he was deputy keeper, was doing to develop into an "information service covering the whole field of Science and Technology."^[102] At that time, Bradford claimed the number of references assembled, covering many aspects of science and technology, as 1,212,700.^[102]

This article was followed by Bradford's "The Necessity for the Standardisation of Bibliographical Methods"^[103] in which Bradford explained the Science Library's method of classification and again stressed the need for cooperation. By the time of the introduction of the paper, a form of interlibrary loan already had been practiced for 2 years by the Science Library, with requests having been received from a number of other countries.^[103]

In 1934, Bradford's classic article^[53] containing his law was printed. Again he wrote about the number of articles abstracted and indexed by a number of abstracting and indexing journals showing his continued concern about wasted money and skills brought about by duplication of effort. He stated that "although the 300 abstracting and indexing journals notice 750,000 articles each year . . . only 250,000 different articles are dealt with and 500,000 are missed."^[53] His concern was shared by Ernest Lancaster-Jones, assistant keeper in the Science Museum. Consequently, "A statistical analysis was made of the references in two quarterly bibliographies compiled in the Science Library, i.e., the *Current Bibliography of Applied Geophysics* and the *Quarterly Bibliography of Lubrication*,"^[104] by Lancaster-Jones, a trained mathematician who also "had received recognition as an expert in applied geophysics."^[105] Bradford, using the data, evolved his "law."^[105]

The method Bradford used was this: For each of the two subjects, geophysics and lubrication, a table was made, listing "number of journals producing a corresponding given number of references"^[53] and each accumulation. (It seems natural that such a list of subjects and the number of references for each, plus a very limited budget and a sincere desire to give exceptionally good library service would cause an active and inquisitive mind, such as Bradford's, to wonder about the actual number of journals needed for coverage.)

One of Bradford's hypotheses was that

references are scattered throughout all periodicals with a frequency approximately related inversely to the scope. On this hypothesis, the aggregate of periodicals can be divided into classes according to relevance of scope to the subject concerned, but the more remote classes will, in the aggregate, produce as many references as the more related classes.^[53]

Observations of the tables evinced three "rough" zones or groupings which Bradford graded as "1) Those

producing more than 4 references a year; 2) Those producing more than 1 and not more than 4 a year; 3) Those producing 1 or less a year.”^[53] Bradford found

The groups thus produce about the same proportion of references in each case, and the number of constituents increases from group to group, by a multiplier which, though by no means constant, approximates fairly closely to the number 5, especially for the two larger groups.^[53]

From his data, Bradford constructed two graphs, plotting the logarithms of cumulated number of journals in relation to the cumulated number of references for each, geophysics and lubrication. He noted that “the later portion of each curve is remarkably close to a straight line,” and observed that

the aggregate of references in a given subject, apart from those produced by the first group of large producers, is proportional to the logarithm of number of sources concerned, when these are arranged in order of productivity.^[53]

With this observation in mind, Bradford constructed a second graph or diagram. This diagram he used to develop an algebraic relation, but only for the “straight” part of the curve noted originally.^[53] From this, he deduced his “law”:

Therefore, the law of distribution of papers on a given subject in scientific periodicals may thus be stated: if scientific journals are arranged in order of decreasing productivity of articles on a given subject they may be divided into a nucleus of periodicals more particularly devoted to the subject and several groups or zones containing the same number of articles as the nucleus, when the numbers of periodicals in the nucleus and succeeding zones will be as $1: n: n^2 \dots$ ^[53]

This was the first statement of what was later to be called the verbal part of Bradford’s Law. Usually referred to as Bradford’s Law of Distribution of Scattering, “sometimes this regularity is also called the law of dispersal of publications.”^[106]

Bradford came to the conclusion that

A standard classification must be adopted, so that references to the same subject would be brought together by the classification, irrespective of source or abstracting bureau, when, without increase of labour, a complete index to scientific literature would be achieved.^[53]

In a paper on abstracting and indexing periodicals, presented in 1937 at the ASLIB Proceedings 14th Conference, Bradford told that the details of the analysis “to determine the extent to which scientific papers are scattered in periodicals devoted to other subjects,”^[104] published in *Engineering* in 1934, were reprinted “in

Publication No. 1 of the British Society for International Bibliography, 1934,”^[104] and added, “Only the results need be quoted here.”^[104]

The law of scattering may thus be stated. If periodicals containing articles on the given subject are arranged in decreasing order of the number of such articles they contain and divided into a nucleus of journals more specifically devoted to the subject and zones of periodicals containing the same number of special articles as the nucleus, the numbers of journals in the nucleus and succeeding zones are as $1:N:N^2 \dots$ where N is about 5 or 6.^[104]

In his first article, Bradford used the value of 5.

In the discussion which followed his presentation, Bradford admitted:

The whole object of the elaborate statistical investigations reported in this paper is to prove beyond any question that quantities of important scientific papers are neither abstracted nor indexed. This is one of the main reasons why so much time and expense is being wasted in duplicating previous work. The other main reason is the adoption of archaic alphabetical methods of indexing, which hide the information and prevent it being found. The adoption of standard methods would go far to remove both these defects.^[104]

The International Federation for Documentation in 1946 published Bradford’s “Complete Documentation in Science and Technology,”^[107] which Bradford presented at the 16th Conference in Paris.^[107] Again, Bradford presented the statistics he used in “Sources of Information on Specific Subjects.” He repeated his description of the “law of distribution” as given in his previous papers and again supported the use of the Universal Decimal Classification. A synopsis of this paper was also printed in *Nature* of January 1947.^[108]

Two more of his publications are merely mentioned here: “Complete Documentation,”^[109] presented at the 1946 Royal Society Empire Scientific Conference when Bradford was president of the British Society for International Bibliography;^[109] and his book *Documentation*,^[110] first published in 1948. In both cases, Bradford used the same statistics he had used in his paper which first presented his law. The statistics were primarily used to support his ideas about cooperative, universal classification; the law was a natural outcome of Bradford’s desire to give added proof and credence to his unswerving conviction.

Part II

Bradford’s law has been the main topic of many articles in literature. A general sampling has been used here.

The discussions of Bradford's law take several directions: analysis of the law itself, attempts to refine it, comparison with other laws, and applications.

The first notable paper on Bradford's Law of Scattering was that of Brian C. Vickery.^[111] When results of an analysis of some 1600 periodical references, borrowed from various libraries by the Butterwick Research Laboratories Library, were compared with Bradford's work, an inconsistency was found.^[111] Vickery discovered that the law as Bradford stated it was not in total agreement with his algebraic expression.^[111] After methodically examining Bradford's algebraic analysis, Vickery proceeded with his own analysis, arriving at this conclusion.

We can...regard the theoretical distribution of papers on a given subject in scientific periodicals, as derived by Bradford, as fully corroborated by the distributions observed in the sample investigations. The rectilinear relation...incorrectly assumed by Bradford to be identical with his theoretically derived relation, fits only the upper portion of the observed curve. The theoretical relation itself, however, enables us to predict the whole curve.^[111]

The next paper to be noted is that of M.G. Kendall.^[112] Kendall's report is an analysis of 370 journals of 1763 references in operational research. For comparison, "1465 references to statistical methodology (covering the period 1925–39)"^[112] were used. Kendall suggested:

There is an obvious resemblance between this type of distribution and that of income. If we equate journals to persons and number of references to size of income we have the characteristic pattern in which a lot of people (journals) have a low income (few references) proceeding regularly to a few millionaires (journals with a large number of references).^[112]

Kendall supported the idea that the Bradford type of distribution is really a Zipf distribution,^[112] and he also provided "a more refined statistical explanation of the straight line observed by Bradford."^[113] (See page 35 of the Kendall article^[112] for Kendall's explanation.)

P.F. Cole in 1962 took "A New Look at Reference Scattering" whereby he plotted the cumulative fraction of references against the logarithm of the cumulative fraction of titles and the resultant slope he named "reference-scattering coefficient."^[113]

Cole gave three possible applications of the coefficient:

- For identifying those groups of references which, though of different sizes, are scattered to the same extent. This facilitates the establishment of further relationships between numbers of journal titles.
- As a criterion for detecting abnormalities in the results of literature usage surveys.
- As a concise means of expressing quantitatively the distribution of references among journal titles. The

extensive reporting in detail which is such a characteristic feature of literature usage surveys would then become entirely unnecessary. . . , which is probably the most important of the three, is self-explanatory.^[113]

Cole came to the conclusion that the reference-scattering coefficient "may be characteristic of the subject field"^[113] and found "A comparison of reference-scattering coefficients derived from data obtained in three published petroleum literature-usage surveys shows that the reference-count method gives untrustworthy results."^[113]

Ferdinand Leimkuhler did a further analysis of the Bradford law and concluded that

Bradford's "law of scattering" is the inverse function for the Bradford distribution, i.e. while the latter predicts the number of references for a given portion of the journals, the former speaks of the number of journals required to obtain a given portion of the references.^[114]

In a later paper (1980), Leimkuhler developed what he said was:

An exact, discrete formulation of Bradford's law describing the distribution of articles in journals (is derived) by showing that Bradford's law is a special case of the Zipf–Mandelbrot "rank frequency" law. A relatively simple method is presented for fitting the model to empirical data and estimating the number of journals and articles in a subject collection.^[115]

In 1981, Brookes did a criticism of Leimkuhler's exact formulation, where he wrote:

An elementary theorem of Shannon information theory shows that his [Leimkuhler] new function is applied to only 2.3% of the statistical information inherent in the bibliography he chooses and that Bradford's original simple formulation not only fits this segment but also the whole bibliography more closely than the new formulation. As every loss of statistical information can be measured, it can be shown that sophisticated mathematical techniques cannot compensate for the information they squander.^[116]

So I question Leimkuhler's present claim. More seriously, however, I question his methodology.^[116]

Brookes concluded:

The results of applying Bradford's law in its original form, i.e. applied to the ranked journals with the ranks marked on a logarithmic scale with the cumulative sums of papers as the ordinates, shows a better fit over any range than Leimkuhler's new function applied to the journals only.^[116]

Of course, Leimkuhler wrote an answer, making necessary corrections and adding, "I share Brookes' concern for empirical validity, but this concern should lead to more, not less, theoretical analysis."^[117]

In 1969 Brookes presented a paper, "Bradford's Law and the Bibliography of Science," in which he stated, "In the management of special libraries the bibliograph offers a check on the completeness of any allegedly complete bibliography—a check that has hitherto been missing."^[118] He made this claim on the basis of the application of Bradford's law in which he found, "All such bibliographs of periodical literature so far examined have either corroborated Bradford's law or else the discrepancies have been plausibly accounted for."^[118]

S. Naranan, in his "Bradford's Law of Bibliography of Science: An Interpretation,"^[119] called attention to the Brookes paper: "An interesting discussion of the law and its application in library systems is given by Brookes."^[119]

For the conclusion of his own paper, he wrote:

In summary, it is shown here that the essential features of Bradford's law of bibliography of scientific literature can be explained in terms of an underlying power law distribution of the number of articles in scientific journals. It is suggested that the law emerges as a natural consequence of exponential growth of scientific literature and journals at comparable rates. Such a model predicts a strong correlation between the age of a journal and the number of articles it carries. The proposed mechanism is likely to find wider application in many other fields of science.^[119]

Brookes responded with an interesting letter. He showed that Naranan's analysis, while not valid for Bradford, "(with suitable verbal amendments) provides a plausible model of Lotka's law."^[120]

This inverse square law of scientific authorship has hitherto been regarded as an inexplicable and useless statistical oddity. Naranan's model of it is therefore welcome. And, together with other measures of scientific productivity, Lotka's law has been applied by Dobrov and Korennoi in determining the optimum size of research institute in the USSR.^[120]

William Goffman and Thomas Morris applied Bradford's Law to library acquisitions.^[121] The authors stated,

Bradford's law should apply to the use of periodicals in a library as well as to the dispersion of articles among journals. These are both acquisitions processes; namely, processes of obtaining relevant items by means of selection.^[121]

Goffman and Morris summarized their findings in the following paragraph:

It has been shown that the distributions of both circulating periodicals and their users in a medical library seem to

obey Bradford's law. Hence, a smallest core of journals which must belong to the library's collection can be defined. This core should consist of the minimal nucleus of periodicals circulating in the library plus the minimal nuclei of journals devoted to the subjects of most interest to the library's nucleus of users. As the budget allows, successive zones of periodicals corresponding to circulation and user interest can be added. As a result, the library collection can be maintained in an orderly and viable state, thus providing its patrons with the most potentially usable materials for the funds at its disposal.^[121]

There was also a note of correspondence regarding the Goffman—Morris suggested "use of Bradford's law of dispersion as an aid to selection decision."^[122] A. Fasler of the Department of Research of Beckett and Colman of Norwich wrote, "this appears to be a most promising method."^[122] He added a warning, however, "Before it is possible to discontinue a journal subscription, it is necessary to make sure that such action will not cause great inconvenience."^[122]

In 1972 Elizabeth Wilkinson wrote "The Ambiguity of Bradford's Law."^[123] As Wilkinson pointed out, it is not necessary to completely understand an empirical law before using it.^[123] "Despite the limitations of our understanding of such laws, then, Bradford promises useful application in the design of more rational and economic information systems."^[123] She listed a number of scientists who have written papers about the Bradford law: "Vickery, Barrett, Leimkuhler, Brookes, Fairthorne, Goffman and Warren, and Naranan,"^[123] and added this observation, "Yet the most remarkable feature that emerges from a study of these papers is that no two of these contributors interpret the law in mathematically identical terms."^[123] She also remarked on the ambiguity of the law itself, for "Bradford formulated his law in two ways: firstly by means of a graph and secondly in words. But these two formulations can be shown not to be mathematically equivalent."^[123]

Vickery has pointed out the disparity between these two formulations. He showed that if n_m journals contribute a cumulative m papers, where n_m is larger than the nucleus, the verbal formulation is equivalent to the expression

$$n_m : n_{2m}n_m; n_{3m}n_{2m} : \dots :: 1 : a_m : a_m^2 : \dots$$

while the graphical formulation is equivalent to the expression^[123]

$$n_m : n_{2m} : n_{3m} : \dots :: 1 : b_m : b_m^2 : \dots$$

Wilkinson continued:

Leimkuhler has expressed the same relation in terms of the proportion of total productivity (papers)...contained

in the fraction. . . of journals. . . Brookes, on the other hand, has developed the graphical formulation of the law.^[123]

In summary then, the distribution of papers on a particular topic among contributing journals is expressed by

$R(n) = j \log (n/t + 1)$ for the verbal formulation, and
 $R(n) = k \log n/s$ for the graphical formulation.^[123]

the constants of these equations are not equal; i.e. $j \neq k$ and $t \neq s$. The verbal and graphical formulations are not, therefore, mathematically equivalent, nor do they converge for large n .^[123]

$R(n)$ is the cumulative total of papers published by the first n journals;
 n is the rank of a set of journals contributing papers on a particular topic constant;
 j, t, k, s are constants.^[123]

Commenting on "The Ambiguity of Bradford's Law" in Letters to the Editor, David A. Smith stated that it "showed clearly the empirical nature of Bradford's Law and the uncertainty about its derivation."^[124]

In 1973, *Library Trends* published an issue, "Analyses of Bibliographies," to which B.C. Brookes contributed the lengthy but excellent "Numerical Methods of Bibliographic Analysis."^[125] He listed five main objectives of numerical analyses,

based on the belief that quantification is a necessary component of the design of economic information systems and that measurement of the key processes of an information system is a necessary component of management control.^[125]

These are:

1. The design of more economic information systems and networks;
2. The improvement of the efficiencies of information-handling processes;
3. The identification and measurement of deficiencies in present bibliographical services;
4. The prediction of publishing trends; and
5. The discovery and elucidation of empirical laws which could form the basis for developing a theory of information science.^[125]

Most of the faults about the application of the technique [Bradford's Law to provide reliable estimates] that have been reported arise from lack of appreciation of the fact that the initiating data must be bibliographically well-defined in subject relevance and in period of publication and also be complete as far as they need to go. And the reliability of the estimates is naturally critically dependent on the precision of the initiating data.^[125]

Other areas in which Brookes believed the Bradford law to be evident and usable were: in relation to "items borrowed from a library;" "contributors to the discussions [at a conference], ranked according to the frequency of their questions or contributions;" "index terms assigned to documents; publication of books by publishers."^[125] Brookes also included a section on obsolescence^[125] which subject is mentioned in the next section.

In 1977, Wilson O. Aiyepoku of Nigeria, in an extensive "analysis of the periodical literature in geography for the whole world and for the USA, British Isles, France, and Germany,"^[126] found evidence "that data conforming with the verbal formulation of Bradford's distribution theory may not necessarily conform with its graphical representation and *vice versa*,"^[126] which is an agreement with other investigations mentioned earlier.

From here on, most of the papers regarding Bradford were surveys of literature pertaining to the law, refinements of the law, collection of data, and application of the Bradford distribution or reiteration of some previously noted facts.

I.M. Sengupta's study fostered

an extension of Bradford's law of scattering: that during phases of rapid and vigorous growth of knowledge in a scientific discipline, articles of interest to that discipline appear in increasing numbers in periodicals distant from that field.^[127]

Pope claimed "The area where the Bradford distribution has the greatest potential is in collections development, both in individual libraries and in library systems."^[128] A.B. Worthen's findings supported the statement that "Bradford's law of distribution can also be applied to the monograph-publisher relationship for a subject literature."^[129]

In 1977, Brookes contributed his "Theory of the Bradford Law"^[130] to the Bradford commemorative issue of the *Journal of Documentation*. In this superb paper, Brookes did a complete reevaluation of the Bradford Law and concluded, "Bradford was therefore a pioneer in social mathematics."^[130] Within the paper Brookes stated:

I describe how Bradford's law can be regarded as a particular example of an empirical law of social behaviour which pervades all social activities. Bradford, without knowing what he was doing in this respect, may have initiated a new branch of statistics—the statistics of individuality—which may also lead to an extension of fundamental mathematical ideas which would make mathematics more useful in the social sciences.

However, this paper will focus on the task of explaining Bradford's law in this wider context and on its applications to documentation.^[130]

The analysis of the Bradford law has hitherto been applied to theoretical models which are too static, too

deterministic and too physical. All Bradford data are derived by observing the *activities* of a set of sources over some appropriate period and by noting these activities, as measured in terms of the numbers of items each source accounts for in that time.

Thus, the Bradford law is concerned with:

- a. A finite set of active sources (*an ensemble*) whose activities are made manifest by the generation or consumption of a specified type of item.
- b. Observation of those activities over a specific *sampling* period.
- c. Items of some *homogeneous* kind which are discrete and countable.

One of the points that has so far escaped analysis is the fact that the statistical distributions of such an ensemble of activity must depend on relationships between the number of active sources, the range and intensity of their activities, and the period of observation which provides the sample data. All Bradford distributions are *samples* of some ongoing activity but, all too often, the sample data have been regarded as constituting a total population.^[130]

ZIPF'S LAW OF WORD OCCURRENCE

The third of the triumverate of bibliometric laws was that of George Kingsley Zipf. While studying linguistics at the University of Berlin,^[54] Zipf had an idea that “speech as a natural phenomena” is really “a series of communicative gestures” and after extensive research found that “the length of a word, far from being a random matter, is closely related to the frequency of its usage—the greater the frequency, the shorter the word.”^[54] He also discovered that

the distribution of words in English approximates with remarkable precision a harmonic series...an unmistakable progression according to the inverse square, valid for well over 95% of all the different words used in the sample.^[54]

Zipf wrote several books “on the theory and application of his principle of relative frequency in the structure and development of language.”^[131] In his first thesis, *Relative Frequency: A Determinant of Phonetic Change*, published in the Harvard Studies in Classical Philology in 1929,^[132] Zipf wrote:

Observing the speech of many hundreds of millions of people, we have demonstrated, in part actually, in part by induction, that the conspicuousness or intensity of any element of language is inversely proportionate to its frequency. Using X for frequency, and Y for conspicuousness (rank) we can express our thesis thus:

$$Y = \frac{n}{X} \quad \text{or} \quad XY = n$$

where n is some constant, the actual size or value of which need not be our immediate concern now.^[132]

This was undoubtedly the foundation on which his other works were based.

His next study, *The Psycho-Biology of Language*, he called “An Introduction to Dynamic Philology,” whose goal was to put language study on a par with exact sciences, by use of “statistical principles.”^[54]

The thesis, very briefly stated, is that the key to the explanation of all synchronic and diachronic language-phenomena has been found in a statistically established tendency to maintain equilibrium between size and frequency.^[131]

The “primary aim is the observation, measurement, and, as far as it is possible, the formulation into tentative laws of the underlying forces which impel and direct linguistic expression.”^[54]

Zipf recognized that there had been accurate investigative studies of language for about 100 years but “nothing has ever been found in the nature of speech in any of its manifestations which is not completely comprised in the statement that speech is but a form of human behavior.”^[54]

His method was “to analyze samples of the stream of speech of many languages into their component parts, [and]...study the frequency distributions of these parts.”^[54] By using data from three different languages (German, Chinese, and Latin) arranged in tables:

it is clear: 1) that the magnitude of words tends, on the whole, to stand in an inverse (not necessarily proportionate) relationship to the number of occurrences; and 2) that the number of different words (i.e. variety) seems to be ever larger as the frequency of occurrences becomes ever smaller.^[54]

Yet the significant feature in the diminution of variety which attends upon an increase in frequency of usage is the orderliness with which the one decreases as the other increases.^[54]

Zipf plotted his observations on double logarithmic paper and after drawing a line “approximately through the center of the points” developed:

the formula $ab^2 = k$ in which a represents the number of words of a given occurrence and b the number of occurrences. That is, the product of the number of words of a given occurrence, when multiplied by the square of their occurrences remains constant, for the great majority of the different words of the vocabulary in use, though not for those of highest frequency.^[54]

Of particularly important note was, “One has the feeling that the exponent of b may well differ with differences in the size of the bulk examined,”^[54] for “It is conceivable that an exponent of b which is larger than the square may represent the frequency distribution in bulks that may be viewed as incomplete discussions of a topic.”^[54]

About 14 years after Zipf’s *The Psycho-Biology of Language* (1935) was printed, his next book, *Human Behavior and the Principle of Least Effort* (1949) appeared.^[55] The purpose of this book, which was an introduction to human ecology, “is to establish the Principle of Least Effort as the primary principle that governs our entire individual and collective behavior of all sorts.”^[55] Zipf stated that, “An investigator who undertakes to propound any such primary scientific principal of human behavior must discharge three major obligations,” that is, have a large verifiable number of observations, be consistent, and have an understandable presentation.^[55] As to the observations:

we may claim in all modesty to have increased the number of our observations to such a point that they may be viewed as empiric natural laws...[for] by means of the accepted methods of the exact sciences, we have established an orderliness, or natural law, that governs human behavior.^[55]

What is the “Principle of Least Effort?” “In simplest terms, the Principle of Least Effort means, for example, that a person in solving his immediate problems will view these against the background of his probable future problems, as estimated by himself.”^[55] In other words, a person will tend “to minimize the probable average rate of his work-expenditure (over time), meaning use the least amount of effort.”^[55] “The connection between this principle and the rank-size law is by no means clear, and Zipf’s theoretical arguments now have at most only historical interest.”^[133]

In writing the chapter “On the Economy of Words,” Zipf applied his principle to speech development. Using Miles L. Hanley’s *Index of Words for James Joyce’s Ulysses*, he found in the rank frequency word distribution “a clearcut correlation” between r (rank) and f (frequency) of the words “in the sense that they approximate the simple equation of an equilateral hyperbola: $rx = C$.”^[55] This, he believed, gave “clear evidence of the existence of a vocabulary balance.”^[55]

More analysis showed

N number of different words of the same f -integral frequency of occurrence (under the conditions of the equation, $rx = C$) will be inversely proportionate to the square of their frequency (approximately)—or, stated somewhat more precisely in equation form, that $N(f^2 - 1/4) = C$.^[55]

This was sometimes considered Zipf’s second law and has been called his “weak” law.

Zipf, applying his “Principle of Least Effort” to many different areas of language and to other disciplines, cited many noted scientists, including Lotka, Davis, Willis, and Pareto, all of whom worked with distributions, but in various areas.^[55] Zipf’s very wordy, philosophical, and detailed explanations are beyond the scope of this paper.

One last observation by Zipf is noteworthy:

The greater the prestige of a person, the *ever greater* will be his power of attraction both for students and for grants of research money for the employment of technicians and for the purchase of expensive apparatus, with the result that his probable opportunities for making and reporting new “important” and “interesting” observations will tend to increase exponentially (i.e., “nothing succeeds like success”).^[55]

Many scientists have analyzed, refined, and evaluated Zipf’s endeavors, but Ronald E. Wyllys, who had made a special study of Zipf’s Law, called it “One of the most puzzling phenomena in bibliometrics”^[134] and noted:

that Zipf’s law only approximates the relationship between rank r and frequency f for any actual corpus. Zipf’s work shows that the approximation is much better for the middle ranks than for the very lowest and the very highest ranks, and his work with samples of various sizes suggests that the corpus should consist of at least 5000 words in order for the product rf to be reasonably constant, even in the middle ranks.^[134]

In Volume 2 of the *World of Mathematics*, the author called Zipf’s *Human Behavior and the Principle of Least Effort* a rather remarkable book; however, “that the law of least effort should be manifested everywhere in human conduct, as Zipf holds—indeed, “in all living process”—is difficult to believe.”^[25] Although Zipf offered much empirical data,

It does not show, as he claims, the existence of “natural social laws,” but, at best, only certain regularities. Brute empiricism is not yet science. Unless observed regularities can be brought into logical relation with other regularities previously observed, we remain at the level of description rather than explanation; and without explanation, we cannot attach much predictive weight to description.^[25]

Anatole Rapaport, in writing about the “Principle of Least Effort,” stated “His [Zipf’s] arguments are vague appeals to the recognition of the Principle in a great variety of situations simply on the basis of its plausibility. And even these appeals are often stretched far beyond ordinary credibility.”^[135] However, other serious researchers, Simon and Mandelbrot in particular, endeavoring to put Zipf’s investigations on a more scientific basis, have also done some very serious evaluating of his work.^[135]

Benoit Mandelbrot has published several studies of generalizations of Zipf's law [one of which is in French], dealing both with the question of whether the slope is -1 and with the deeper problem of explaining why the *rf* products should be relatively constant.^[134]

The purpose of Herbert A. Simon's paper, "On a Class of Skew Distribution Functions," published in 1955 was:

to analyze a class of distribution functions that appears in a wide range of empirical data—particularly data describing sociological, biological, and economic phenomena. Its appearance is so frequent, and the phenomena in which it appears so diverse, that one is led to the conjecture that if these phenomena have any property in common it can only be a similarity in the structure of the underlying probability mechanisms. The empirical distributions to which we shall refer specifically are: 1) distributions of words in prose samples by their frequency of occurrence; 2) distributions of scientists by number of papers published; 3) distributions by cities by population; 4) distributions of income by size; and 5) distributions of biological genera by number of species.^[77]

This paper included mathematical and technical explanations of a stochastic model primarily attributed to D.G. Champernowne^[77] and "the observed fit of the Yule distribution to a number of different sets of empirical data"^[77] including word frequency (Zipf). Simon's "Some Further Notes on a Class of Skew Distribution Functions," which is primarily in answer to a note written by Mandelbrot, followed in 1960.^[136] In Simon's words, "This note takes issue with a criticism by Dr. B. Mandelbrot of a certain stochastic model to explain word-frequency data."^[136]

Bruce M. Hill, a professor of statistics, was responsible for a group of papers regarding Zipf's law. Hill's first paper was "Zipf's Law and Prior Distributions for the Composition of a Population" (1970) in which he cited Willis for first noting the law and discussed the fact that the "theoretical models yielding such a law have been proposed by Yule and Simon."^[137] "Rank-Frequency Form of Zipf's Law" (December 1974), published next, "presents a theoretical derivation of the rank-frequency form of Zipf's law based on a Bose-Einstein form of the classical occupancy model."^[138] "Of course, other models have been formulated, and other approaches taken, in regard to justifying the Zipf (or Pareto) law, most notable those of Mandelbrot and Simon."^[138] Hill's next paper was "Stronger Forms of Zipf's Law" (March 1975), which is really an extension of his 1970 paper.^[139]

In September 1975, Sichel wrote "On a Distribution Law for Word Frequencies," for as he stated,

In the past, several attempts were made to represent word frequency counts by statistical distribution laws. Of the models suggested, none was singularly successful when applied to a variety of data over the entire length of the observed word distribution.^[140]

Therefore, Sichel developed a new model to which "twenty observed distributions quoted in the literature were fitted and the results look most encouraging."^[140]

Also in 1975, R.E. Wyllys presented a paper at the ASIS 38th Annual Meeting in which he included an excellent summation.

Inclined toward mysticism, Zipf not only leaped to the conclusion that the "true" slope of rank-frequency curves was -1 , but also claimed that this regular slope resulted from some fundamental force of nature. In the broad sense, this claim had to be correct; but Zipf variously described the force as that of the struggle between the "life tendency" and the "death tendency" or the "Force of Diversification" and the "Force of Unification," and finally as the "Principle of Least Effort," for none of which did he furnish an operable definition. However, in work summarized... Zipf did show that an astonishingly wide range of phenomena... exhibited distributional behavior that could be approximated by his "law."^[141]

Wyllys claimed his report and

study established that significant, detectable variations in rank-frequency curve slopes do exist, that they appear to have the potential for subject-field discrimination, and that they may perhaps also be usable for the identification of subfields of especially rapid development.^[141]

BRADFORD-ZIPF PHENOMENA

A number of researchers have attempted to explain the relation between the Bradford and the Zipf laws. One of the first papers to do so was "The Bibliography of Operational Research" by M.G. Kendall.^[112] Kendall suggested looking at Bradford's data through the eyes of a statistician and, contrary to Bradford, cumulate data from the bottom of the listing (see the sample chart given in Table 3). From this, he developed a relation which he reasoned indicated Bradford's Law would be true.^[112] According to his analysis, this would make the Bradford and Zipf laws almost equivalent.^[112] (See Kendall's paper for mathematical explanation.) Kendall called the results of Yz (see Table 3) a constant.

In 1967, Ferdinand Leimkuhler wrote his paper "The Bradford Distribution," in which he stated,

Bradford's "Law of Scattering" is the inverse function for the Bradford distribution, i.e., while the latter predicts the number of references for a given portion of the journals, the former speaks of the number of journals required to obtain a given portion of the references.^[114]

Leimkuhler also commented that "Kendall has suggested an alternative explanation of the linear approximation formula, in which he considers the number of titles with a

Table 3 Using Bradford's data from lubrication to illustrate the comparison of Bradford's and Kendall's methods.

Number of journals	Number of references

reference count greater than some given value"^[114] (column *Z* in Table 3). He showed his compliance with Kendall's mathematical manipulations by agreeing that "Thus Bradford's law and Zipf's law are essentially just two different ways of looking at the same thing."^[114]

Brookes, in one of the first of a group of papers, had this to say about the Leimkuhler paper:

Leimkuler's analysis therefore provided documentalists for the first time with a general formula which expresses the distribution of papers relevant to a given topic over the range of productive journals. Up to the present, information systems have tended to evolve, documentalists using their experience and making *ad hoc* adjustments to satisfy the demands for services made on the system. But the discovery and formulation of statistical laws of wide generality would enable documentalists to *design* information services. . .

Unfortunately, though Leimkuhler's formulation can be used theoretically without difficulty, it has some disadvantages for the practical documentalists.^[142]

An outstanding disadvantage was the need for tedious statistical computation;^[142] "the exasperation evoked by an attempted practical application of Leimkuhler's formulae [that] led the author of this paper to seek a simpler formulation of the Bradford distribution."^[142]

However, the near identity of Zipf's and Bradford's laws is not immediately obvious because, in practice, the most marked deviations of empirical data from the mathematical expectations of the Bradford law are likely to occur among the most productive journals of the nucleus. . . The Bradford law is not reliable in predicting the productivity of individual journals: it is a statistical law which relates only to large collections of journals or to major subsets of such collections.^[142]

Brookes then proceeded to develop the relationship " $R(n) = k \log n$,"^[142] which he believed was "an exact formulation of the distribution which satisfies the Bradford law."^[142]

The Groos Droop was also mentioned in this Brookes paper. "When empirical Bradford data are plotted in the expectation of yielding a straight line corresponding to $R(n) = k \log n$, the ideal straight line is attained only in part."^[142] Groos, after whom the droop is named, noticed when he plotted the Keenan-Atherton^[143] data according to Bradford that "the plotted points eventually form a curve which droops below the linear predictions of the Bradford law."^[142]

The upward curving bottom of the curve (of the bibliograph) represents the small nuclear zone of the most relevant journals. The upper end of the curve, usually termed the Groos Droop, represents the peripheral zone where relevant references are widely scattered among a great number of journals.^[144]

It has been suggested but not proven that the droop indicates that the data are incomplete.^[142] E.T. O'Neill, on the other hand, claimed "the pronounced droops have occurred most frequently in large and therefore presumably relatively complete sets of data."^[145]

In March 1969, "The Complete Bradford-Zipf 'Bibliograph' " by Brookes was published.^[146] This paper "summarizes the outcome of recent analyses of empirical data which have enabled the general form of the Bradford-Zipf distribution to be elucidated."^[146] Brookes explained "Bibliograph" as follows:

In general, the complete "bibliograph" has two components. . . an initial rising curve. . . running smoothly into. . . a straight line. . . Since a source, to be recognized and counted as a source, must contribute at least one item, it is possible to estimate the end-point. . . of the line. It has been shown that an estimate of the total number of *contributing* sources is given by the slope of the linearity.^[146]

The initial curvature indicates a situation in which restraints are imposed on the productivity of the contributing sources; the linearity indicates a true Zipf situation in which there are no restraints on productivity.^[146]

The complete “Bibliograph” was soon followed by two other papers by Brookes: “Bradford’s Law and the Bibliography of Science” and “Theory of the Bradford Law.” In “Bibliography of Science,” Brookes specified “the requirements for conformity with the law (Bradford-Zipf) in more general terms. . . .”

The Bradford-Zipf distribution can be expected to arise when selection is made of items, characterized by some common element, which are all equally open to selection for an equal period and subject to the “success-breeds-success” mechanism, but when selection of a most popular group is also, but to a weaker extent, subject to restriction. It is thus a general law of concentration over an unrestricted range of items on which is superimposed a weaker law of dispersion over a restricted range of the most frequently selected items.

The Bradford law remains empirical until it is better understood. But if it can be demonstrated to be widely applicable, reliable and useful in practical operations, there is no need to wait until the underlying theory is completely established.^[118]

Bradford’s law can be used to help in the designing of information systems, “in rationalizing library services, and in making more economic and fruitful use of the 29,000 scientific periodicals estimated to be the current production.”^[118]

Brookes gave as applications of Bradford’s law:

1. Use in computerized bibliographic search systems (Medlars).^[118]
2. “Management of special libraries.”^[118]
3. Discarding of “aged” periodicals (obsolescence).^[118]
4. “Planning of special library systems.”^[118]
5. “Subject bibliographies can be resolved or composed without difficulty.”^[118]

“Theory of the Bradford Law” was printed in the *Journal of Documentation* in 1977 and included in *Key Papers in Information Science*, published in 1980. In Brooke’s words, “In this paper I describe how Bradford’s law can be regarded as a particular example of an empirical law of social behavior which pervades all social activities.”^[147]

“The analysis of the Bradford law has hitherto been applied to theoretical models which are too static, too deterministic and too physical.”^[147] “All Bradford distributions are *samples* of some on-going activity but, all too often, the sample data have been regarded as constituting a total population.”^[147] “The law as Bradford formulated it is a hybrid.”^[147]

Brookes then concluded:

So as Zipf abandoned the use of ranks in favour of frequencies, whereas Bradford’s law can be expressed simply only in terms of ranks, I see no further reason to continue to use Zipf’s name descriptively in the context of Bradford’s law. When as many ambiguities surrounded the Zipf law as once surrounded the Bradford law, the use of Zipf’s name in the present context serves no useful purpose.^[147]

In 1969, M.K. Buckland and A. Hindle wrote a survey article, “Library Zipf” for the *Journal of Documentation*,^[148] in which they mention a publication by Kozachkov and Khursin who “propose a basic model, called the ‘hyperbolic ladder,’ and relate it, in particular, to work in linguistics by Zipf, in documentation by Bradford, and in the science of science by Lotka.”^[148]

According to Buckland and Hindle,

The earliest recognition that Bradford’s law of scattering was a form of Zipf’s law seems not to have come until a paper by Kendall in 1960—a conclusion since endorsed by Leimkuhler, Kozachkov and Khursin, and Brookes.^[148]

A number of letters resulted from Buckland and Hindle’s survey. Fairthorne claimed that the relation of the Bradford and Zipf Laws was suggested as early as 1953 and may have been referred to as early 1948 in a discussion of a paper by Vickery.^[149]

D.A. Smith also wrote a letter, not so much critical of the Buckland-Hindle article as critical of the theory discussed. He noted “Other authors have followed this well-worn path of references cited by Buckland and Hindle.”^[150]

The search for unifying principles is doubtless a worthwhile aim but will not justify the use of analytical techniques in libraries. Only attention to practical applications will do this and a study of the methods used in business management may well be of more value than the uncritical acceptance of ideas put forward by those who have a particular concern with theories of society.^[150]

Back came a reply from the authors of the original article. They apologized to Fairthorne for their oversight, but to Mr. Smith they addressed this,

We chose to stress Zipf mainly because, as we wrote, ‘In the field of libraries, where apparent manifestations of Zipf’s laws are evident, there is independent evidence that convenience is a dominant factor in determining library use. . . .’^[151]

In our own experience of attempting to apply the mathematical methods used in business management to practical problems in libraries, we have found that librarians

recognize well enough that mathematical predictions can only be estimates based on assumptions and require some check on their accuracy.^[151]

Brookes also wrote concerning Smith's letter:

Pareto's law [Smith seemed to be pushing for Pareto] does arise in documentation—in the data relating to the productivity of the periodicals in Bradford "nuclear" zones, where I interpret its occurrence as evidence of some control of publication. . . . Incidentally, Pareto has no monopoly of the distribution Mr. Smith claims for him and for economics. Biologists too have found applications of the same distribution in statistical taxonomy though they chose to refer to the same (Pareto) empirical distribution as the Willis distribution. And I am at present engaged in applying the Bradford-Zipf distribution to a problem in paleontology. . . .^[152]

My own view of empirical laws in documentation is that they provide us with prospects of making considerable economies in the running of special libraries and information services.^[152]

The use of the Bradford-Zipf relation was suggested by Stephen Bulick in the "interaction between book users and books available for use in a library."^[153] The author found:

the verbal formulation consistently produces a lower error percentage than the graphical and is, in fact, a good overall predictor. Book use, then, is a Bradford-Zipf phenomenon. . .

This offers support for the strategy of shortening loan periods for frequently circulated items. Other potential uses for a function that describes the distribution of book use over a collection might include core collection determination or the derivation of a marginal utility function describing the effect on total use of adding to a collection.^[153]

In October 1976, Abraham Bookstein's "The Bibliometric Distributions" was published.^[154] The premise of this paper was:

One of the more surprising findings in the information sciences is the recurrence of a small number of frequency distributions. In this paper, these distributions are described, and a point of view is adopted that allows us to understand them as being different versions of a single distribution. The empirical distributions are shown to be special cases of a single theoretic distribution.^[154]

All of these distributions are almost equivalent. . . . In each case we have a set of entities (for example, chemist, words) producing events (publications, occurrences) over some dimension of extension (time, length of text); and in each case the distribution describes the number of

occurrences of events over a fixed interval of that dimension. Under these conditions it is possible to describe the same distribution in at least four distinct ways: these modes of description are represented above by the distributions of Lotka, Zipf, Bradford, and Leimkuhler.^[154]

The four distinct ways are noted in Bookstein:

The four ways are: 1) One may rank the entities according to the values of the attribute, and express the value of the attribute as a function of the rank. This is the form the original expression of Zipf's law takes; 2) Conversely, we can define a unit of the attribute, and indicate how much the rank must increase if we are to gain an additional unit quantity of that attribute. Bradford chose to define his law in these terms; 3) The third form is to cumulate the attribute and indicate how many entities (e.g. what rank of journal) is needed to produce, collectively, a given amount of the attribute (e.g., a given number of articles). This is a form of Bradford's law as defined by Leimkuhler; 4) Finally, one can express, for any possible value of the attribute, how many entities take that value. This, of course, is the form taken by Lotka's law.^[155]

Other writers. . . have shown that Lotka's law and Bradford's law are different approximate descriptions of the same basic distribution, and that, at least for larger values of r , both agree with Zipf. . . . The distributions are approximately the same; it is only the entities and events that differ.^[154]

"Both Zipf's and Bradford's laws emphasize the higher-ranking entities. Lotka, on the other hand, begins with the low end."^[154]

An analysis then led Bookstein to conclude, "Thus the Bradford, Leimkuhler, and Lotka laws, which are virtually equivalent to each other, and also the Zipf law, are also special cases of the forms derived by Mandelbrot and Bookstein on theoretical grounds."^[154]

Citation Analysis

Since the inception of bibliometrics, citations have played a very important role in bibliometric research. At first, there were citation counts which were used to indicate importance of journals; these counts being statistical did not consider the quality of a work. Ultimately, the citations themselves were closely examined as indicated in many research papers. Citation analysis "is a method based on the principle that articles citing the same references also have much of their content in common," stated M. Osinga in "Some Fundamental Aspects of Information Science."^[156] Elliot Noma followed the same thinking, shown by the comment "The similarity between an article and the articles on its reference list is one of the cornerstones of citation analysis."^[157] The supposition that

articles and their references are related has led to many studies, including citation counts (Gross and Gross), impact factor (Garfield), bibliographic coupling (Kessler), cocitation (Small), and citation indexes.

In discussing citation study in his thesis, Dale Lockhard Barker noted there were “two principal types of citation studies. . . These are 1) studies bearing on productivity in all or part of science literature and; 2) those reflecting the use of all or part of the literature.”^[36] Studies based on entry counts in source materials are productivity studies.^[36] The source materials may be “major abstracting or indexing services, review journals, or comprehensive monographic bibliographies.”^[36] “The citations. . . are not to literature used but to literature published.”^[36] An example of such a study would be the work of Samuel Clement Bradford.

“The second type of citation study” was based on the literature used by an author.^[36] An example would be the citation count presented in the Gross and Gross paper.

Linda C. Smith, in her overview of citation analysis for the Bibliometrics Issue of *Library Trends*,^[158] explained the two kinds of citation: “A reference is the acknowledgment that one document gives to another; a citation is the acknowledgment that one document receives from another.”^[158] A relationship is implied between the cited document and the citing document, all or part. “Citation analysis is that area of bibliometrics which deals with the study of these relationships.”^[158]

Studies have found that reasons for citations are numerous and greatly varied. Ina Spiegel-Rosing discovered 13 different categories for use of references in *Science Studies*.^[159] Charles Oppenheim and Susan Renn list seven reasons for citations to some highly cited old papers:

- A. Historical background
- B. Description of other relevant work
- C. Supplying information or data, other than for comparison
- D. Supplying information or data for comparison
- E. Use of theoretical equation
- F. Use of methodology
- G. Theory or method not applicable or not the best one.^[160]

The amount of literature about citation analysis is truly extensive, if not actually overwhelming. It is evident that whenever a subject “grows” (research fronts), new views or facts are presented and more studies then are accomplished validating or questioning those views or facts. When the views are analyzed from different aspects, articles are written and printed, and following a logical sequence, usually a bibliography and/or index of the subject is then compiled, such as Pritchard’s *Statistical Bibliography: An Interim Report*, Pritchard and Wittig’s “Bibliometrics: A Bibliography and Index,” and Vlachy’s “Bibliography of Lotka’s Law and Related Phenomena.”

In the case of citation analysis, Garfield established and organized his extensive *Science Citation Index*; Renata Tagliacozzo wrote her “Citations and Citation Indexes: A Review;”^[161] and Hjerpe developed his report, “An Outline of Bibliometrics and Citation Analysis,”^[162] followed by “A Bibliography of Bibliometrics and Citation Indexing and Analysis.”^[163]

Some techniques using citation analysis are obsolescence, clustering, and citation indexes; information about these is given in the following subsections.

HALF-LIFE AND OBSOLESCENCE

When Gross and Gross determined what materials were vital for the maintenance of a dynamic college and library, they were projecting needs. The flip side of this positive thinking is what is no longer needed or of use. This can be interpreted as “obsolescence.” Obsolescence is the process whereby materials become no longer useful or reliable.^[29] Gosnell, whose dissertation was on obsolescence, stated “the causes of book mortality or obsolescence are many, varying from pure fad through extension of scientific knowledge, technological changes, to fundamental changes in our civilization.”^[30] The rate of obsolescence varies with the discipline. Books according to Gosnell “represent one of the higher forms of culture and the rate at which they are discarded and replaced may give some suggestion as to the rate of evolution of the general culture of which they form a part.”^[29]

In 1960 Robert E. Burton and R.W. Kebler wrote “The ‘Half-Life’ of some Scientific and Technical Literatures,”^[164] in which they compared the rate of obsolescence of scientific literature with that of radioactive substances.^[164] The authors noted upon their research “A short half-life, which is equivalent to rapid obsolescence, is the result of rapidly changing techniques or interest within a subject field.”^[164]

Half-life as explained by Maurice B. Line was “half the active life,”^[165] and this was usually interpreted “as meaning the time during which one-half of the currently active literature was published.”^[165]

The results of many of the half-life studies varied so greatly that they did not project a possible general application. There also were discrepancies as to meanings. This was Maurice Line’s explanation of the process. If the average number of articles in each journal remained constant, and the number of journals doubled, “the probability of citation is twice as great.”^[165] “The so-called ‘half-life’ of a literature is (therefore) compounded of its obsolescence rate and its growth rate.”^[165] Line then proceeded to develop mathematical expressions for determining a half-life corrected because of the two rates.”^[165]

In 1970, Brookes analyzed Line’s technique and concluded that it was “both questionable and impractical.”^[166] He stressed that the “rate of obsolescence is a

function of both the subject literature and of the local usage of that literature.”^[166] A much more accurate measure of obsolescence would be in “sampling the actual usage of the literature in the local library context”^[166] rather than using Line’s correction method. In other words, librarians interested in the obsolescence of holdings should make their own direct measurements. Brookes believed there had been sufficient theorizing; the time had come for proper testing of the basic assumptions which he was in the process of doing, which work, “relying mainly on citation analysis, is tedious but straightforward.”^[166]

The next paper to deal with obsolescence was that of Sandison, who stated “some aspects of the theoretical approaches and terminology need clarification.”^[167] The crux of the papers on this controversial subject was in two frequently observed facts,

first that, in any collection of citations and of items used in a library, the numbers decrease with the time since publication; and secondly that the numbers of items published and available for citation have increased year by year.^[167]

Age does not completely determine obsolescence; “it is possible for older literature to be in greater demand than newer.”^[167]

Michael K. Buckland—in posing an interesting question, “Are obsolescence and scattering related?”—explained obsolescence as the “relative decrease in use of material as it ages” and scattering as “extent to which the use of material tends to be concentrated in a few titles.”^[168] Results of research “were indicative but not conclusive.”^[168] Line, in Letters to the Editor, commented on Buckland’s hypothesis and claimed, “The reasons why scatter and obsolescence occur are numerous and complex, and vary from discipline to discipline.”^[169]

Sandison also wrote to the editor claiming Buckland fell into the same trap to which most citation analysis work has succumbed by “assuming that every citation can be treated as of equal weight as a parameter of a literature.”^[170] “But before further progress is possible in the interpretation of citation analysis, reliable data are required for the growth of the literature studied so that citation available per item can be calculated.”^[170]

Then, in 1973, J. Michael Brittain and Maurice B. Line coauthored “Sources of Citations and References for Analysis Purposes,”^[171] categorizing “the uses to which analysis of bibliographical references and citations can be put.”^[171] The authors identified five sources of references and citations and enumerated advantages and disadvantages of each. Included as one of the listed items was whether obsolescence patterns could be traced.

The “measurement of obsolescence” and “obsolescence, scatter, and growth” were sections in Brookes’s next publication.^[125] Brookes was truly interested in libraries, as was indicated in his observations of use of a library and in his remark “It is, however, simpler to

recognized that any literature ages at a uniform rate, but that some libraries, especially new ones, can hope to attract usage at a rate which exceeds the rate of obsolescence.”^[125]

Although there was some evidence of a positive correlation of scatter and obsolescence, it was not wholly convincing. “It may be so, although at the present time there is no general agreement on how scatter should be defined or measured.”^[125] Both scatter and obsolescence seem to be determined by the rate of growth; “the faster the rate of growth, the less is the scatter and the more rapid the obsolescence.”^[125]

Obsolescence has been the concern of librarians for some time because of overabundance of materials and lack of housing. However, interest in obsolescence was not imperative during the period of money availability which fostered more building and greater collections. Present lack of funds has made it necessary for librarians to reevaluate expenditures and has resulted in a recurrence of interest in purchasing and weeding practices. No doubt, this has aroused the attention of researchers again, but Maurice Line has emphasized, “no measure of journal use other than one derived from a local-use study is of any significant practical value to librarians.”^[172]

Kaye Gopen and Sigrid P. Milner accomplished an extensive study of obsolescence research in 1981^[173] and observed several interesting and important facts; there are many needs: much more investigation of the obsolescence hypothesis; agreement on definitions; proof of the “obsolescence concept” validity; and justification for costs acquired in making use studies. There are also problems: unfamiliarity of librarians with mathematical manipulations; controversial results of past research; and inherent local library “use peculiarities.”^[173]

CITATION INDEXES

Samuel Clement Bradford would be elated if he were to see Eugen Garfield’s work. Bradford, as stated earlier, advocated cooperation in indexing science articles for a universal index, and Garfield seems to have found a solution. In his “Citation Indexes in Sociological and Historical Research” of 1963,^[174] he reminded us that in his original paper of 1955, “Citation Indexes for Science,”^[56] he “proposed the compilation of comprehensive citation indexes primarily as an effective means of disseminating and/or retrieving scientific literature.”^[174] (“Citation Indexes for Science” is discussed in the section headed Seminal Bibliometric Papers.) His second paper was a review of his efforts since the first article appeared and was an emphasis on the fact that “Impact is not the same as importance or significance. There is no specific correlation between the number of papers published by an individual and the quality or importance of his work,”^[174]

although there have been indications that high publication rates usually go with high quality work.^[174]

Citation indexes have been called facilitators by Eugene Garfield; they facilitate personnel and fellowship evaluation, historical research, and computer programs.^[174] But what is a citation index?

A citation index is an ordered list of cited articles each of which is accompanied by a list of citing articles. The citing article is identified by a source citation, the cited article by a reference citation. The index is arranged by reference citations. Any source citation may subsequently become a reference citation.^[175]

“Arrangement by author is favored in the citation index and the source index because the research scientist usually approaches the literature first by author.”^[175] “A complete source index containing full source-article titles and certain additional data... is similar to an upgraded conventional author index covering all disciplines.”^[175] It was assumed that the source paper bibliographies were true indications of previous information; otherwise, the citation index would not be valid.^[175]

In his “Citation Indexing: A Natural Science Literature Retrieval System for the Social Sciences,”^[176] Garfield differentiated between the dissemination and retrieval of information. Information which was current was disseminated but information which had been stored was retrieved.^[176] The problems associated with both dissemination and retrieval, he believed, “are largely overcome by citation indexing.”^[176]

Since citation indexes deal with citations, it is important to explain the different kinds.

In an explicit citation, the source or citing document will identify the cited works by use of formal reference citations, which enable the reader to locate the document in question. In an implicit citation, one recognizes that some other work has been drawn upon or alluded to, but the citing author does not consider it important enough for a formal citation.^[176]

In other words, one is definite; the other is implied.

In the case of conventional indexes, it is necessary to use very highly trained indexers; in citation indexes, the author of a paper provides the indexing by providing the citations.^[176]

In another article, Garfield remarked that clearly visible linkages are “ordinarily provided by authors in the forms of explicit citations. Less clearly seen are implicit references.”^[177] However, in traditional indexing systems, treating each document as an independent unit “results in the loss of important informational links;”^[177] thus, by showing the linkages, citation indexes are more efficient.

In 1965, J.E. Terry, in a critical review of *Science Citation Index: An International Interdisciplinary Index to the Literature of Science*, reminded the reader that

“The whole concept of citation indexing in science should be regarded as still at an experimental stage,”^[178] a fact that Garfield supported by continually stating that improvements are constantly being made.

In his “Citation Indexing for Studying Science” of 1970,^[179] Garfield explained what the *Science Citation Index* does.

Basically...the SCI does two things. First, it tells what has been published. Each annual cumulation cites between 25 and 50 per cent of the 5–10 million papers and books estimated to have been published during the entire history of science. Second, because a citation indicates a relationship between a part or the whole of a cited paper and a part or the whole of the citing paper, the SCI tells how each brick in the edifice of science is linked to all the others.^[179]

“Important applications for the SCI have been found in three major areas: library and information science, history of science, and the sociology of science.”^[179] The first purpose of the SCI was as a retrieval tool which would be used in library and information science.^[179] In historical research, citation indexing aided in identifying “key events, their chronology, their interrelationships, and their relative importance.”^[179] In sociological processes, by means of citation networks, the papers that have had the most impact (most cited by others) can be recognized (The reader’s attention is called to item (15) of Conclusions, p. 33. “It is believed that citation analysis has been demonstrated to be a valid and valuable means of creating accurate historical descriptions of scientific fields, especially beyond the first quarter of the twentieth century when bibliographic citation had become well established as part of scientific publication.”^[180]). There are also different kinds of citation indexes: pertinent to one field or to one journal, or interdisciplinary.^[181]

There have been difficulties with citation indexes—costs, various spellings of authors’ names, authors with the same name, incorrect citing information, and other human errors—but Garfield believed the advantages far outweigh the disadvantages.^[179]

An excellent summary on citation indexes can be found in *On Documentation of Scientific Literature*:^[182]

A citation index consists of two different parts:

1. An index of all articles published in a selected group of periodicals in a given year (so-called sources index).
2. An index, arranged by author, of all articles cited in the articles of group (1) (so-called citation index).

The use of a citation index is: locating a known author in (2) and searching the sources, quoting his articles, in (1). If no author is known, a subject index is available leading to author names.^[182]

The same writer also listed three principal uses of citation indexes:

- (a) Searching for the history of an idea (patent).
- (b) Searching for the use and expansion of a certain method after its first publication.
- (c) Searching in multidisciplinary fields.^[182]

CLUSTERING

The topic “clustering” as part of citation analysis should not be overlooked. Mark P. Carpenter and Francis Narin reported their result of a cluster analysis in “Clustering of Scientific Journals”^[46] based on the *Journal Citation Index* (JCI) citations from 1,821 different journals.^[46]

The process [clustering process] used to divide sets of journals into subject areas has two underlying assumptions: first, that journals which deal with the same subject area will have similar journal referencing patterns; and second, that journals which deal with the same subject area will refer to each other.^[183]

The “first experiment using a new computer-based technique to identify clusters of highly interactive documents in science”^[183] was reported in Henry Small and Belver C. Griffith’s study “The Structure of Scientific Literatures I: Identifying and Graphing Specialties.” The paper was based on the idea that “scientific specialties” exhibiting “high levels of activity” will be represented by clusters.^[183] Clusters of cited documents are groups made evident by cocitation and cocitation strengths. Cocitation is the citing of two documents together creating a link, the strength of which is indicated by the number of times the pair is cited together.

Another important study undertaken by Small was based on the hypothesis that “highly cited and co-cited papers in a cluster is a concrete representation of the cognitive structure... that the authors of the highly cited papers constitute the elite, or ‘leading’ scientists of the specialty.”^[184] Small made three suggestions regarding clusters: 1) “. . . these reflect the social and cognitive structures of research specialties;”^[184] 2) “The authors of citing papers then comprise a subgroup of the current practitioners in the specialty;”^[184] and 3) “By using the same thresholds each year the growth of the specialty can be gauged in terms of the growth of the cluster.”^[184]

Sullivan, White, and Barboni did an evaluation study of citation analyses and agreed that citation analysis seemed to them to be a useful technique,^[185] but of Small’s three claims, the second and third were not supported by their data.^[185]

Trudi Bellardo also did an evaluation of the use of cocitations and made this summation:>

The primary utility of co-citation analysis is as a research tool for studying the sociology and history of science and

scientists. More specifically, co-citation analysis is a tool for understanding the specialty structure of science. The clusters of works which are connected by being co-cited are indirect indicators of the birth, growth, and death of scientific specialties and their social and cognitive structures.^[186]

Since

the observed relationships are in substance those which have been established by the collective efforts and perceptions of the community of publishing scientists. . . our task is to depict these relationships in ways that shed light on the structure of science,^[183]

wrote Small and Griffith. This, they believed, was accomplished by the clustering method.

CONCLUSION

The idea of chronological arrangement of periodicals to show trends is a very good theory, but because of the increasing number of bibliometric papers, any research concerning the theory should use technology in the gathering of data. Alan Pritchard listed 700 items in his interim bibliography of 1969,^[3] Roland Hjerpe cited 2032 items for bibliometrics and citation analysis as of 1979,^[163] and Pritchard stated in the introduction of his *Bibliometrics: A Bibliography and Index* that the literature at that writing (1981?) contained 5000–6000 items.^[187] This increase in the number of publications may have been due to the use of bibliometric techniques in various disciplines, to the many grants under which a number of studies have been accomplished, and to the greater interest in the theory of literature structure.

Studies have indicated that “bibliometric measures have been applied to evaluation of scientists, academic departments, and scientific publications.”^[48] Alan Pritchard and Glenn Wittig advised “some of the uses to which bibliometrics may be put are:”

1. The use as a visible sign of an underlying problem of social structure relating to individuals, e.g. sex differences, promotion policies, creativity.
2. The use for the evaluation of organisations—research sponsorship, government policies, standing in the academic community etc.
3. The use for the evaluation of countries, i.e. science policy studies, either looking at the situation within a country or comparing countries.
4. The use for the examination of the general growth and development of the social structure within a subject or discipline.
5. The use for evaluating individual journals or groups of journals, especially for acquisition decisions.
6. The use as raw data for operations research and other mathematical models.

7. The study of bibliometric distributions in their own right or as members of larger families which are of interest to social science generally.^[187]

Citation counts have been used to indicate linkages of papers as suggested by Henry Small,^[71] of individuals and their special fields mentioned by Broadus,^[188] and of institutions, programs, fields, and subfields as suggested by Narin.^[48] Citations are a valid measure of quality stated Lawani in his discussion regarding Nobel prize winners;^[189] “Derek de Solla Price of Yale [also argued] that citations are an accurate measure of individual quality.”^[190] Others believed that citations were not a true “measure of eminence.”^[188]

Several instances of valid practical applications of citation analysis have been cited by Wade, including a court case contesting the promotion of two men over a woman who had been denied tenure, and the National Science Foundation’s use of citation analysis to help determine the distribution of grants to chemistry departments.^[190]

Garfield used his *Citation Index* to point out key journals in disciplines,^[58] but Carlos Cuadra stressed that “no amount of quantitative or mechanical manipulation of texts, bibliographies, or other tools will enable one to identify the key contributions to information science.”^[191]

One of the most interesting studies was that in textiles, “The Examination of Research Trends by Analysis of Publication Numbers,”^[192] and although no clear-cut trend in total textile research could be concluded, basic research was decreasing; applied research (i.e., production and properties of yarns and fabrics) was increasing.^[192] It was hinted that such information could help channel careers.^[192] This examination was done for total research effort rather than interest in research significance, although it was recognized that counting publications did not indicate the importance of the research.

Wade also presented a possible use as volunteered by Morton V. Malin, “to identify the gaps in a country’s published research.”^[190]

Lawani had such strong feelings about scientists and their productivity being evaluated through citation analysis more and more, that he admonished scientists to “become familiar with the method of citation analysis” and the uses to which it is put “whether or not they consider the basis for such applications well-founded.”^[189]

These are isolated instances and do not have the practicality one would desire. As Nicholas Wade so aptly stated, “the impact of citation analysis on the scientific community cannot yet be assessed because all that has really been demonstrated so far is promise, not practicability.”^[190]

As applied to libraries, bibliometric analyses have been instrumental for book and periodical acquisitions, library use analysis, and weeding of obsolete materials. Carol Tenopir noted Bradford’s law had been shown “to apply to the items borrowed from a library, the users of a library,

contributors to a discussion at a conference, the index terms assigned to documents, and the publication of books by publishers.”^[193] Marcia Sprules informed us of an attempt of an academic library “to evaluate its periodical holdings in all disciplines” to identify candidates for cancellation.^[194]

Maurice Line wrote that “most studies of journal citations and library use are of little if any practical use to librarians...because of inadequate data collection and analysis.”^[195] On the other hand, Narin, in the foreword and summary of McAllister’s report, claimed “Citation analysis is steadily growing as a technique for analyzing scientific productivity.”^[196] Librarians, who were the first to use bibliometric procedures, were not primarily mathematicians or statisticians, nor were they bibliometricians.

Although Schmidmaier observed that “Bibliometrics has its...place in library science, bibliography and informatics,” he believed it needed promoting and that this should and “must begin with the popularization of the contents and teaching of basic knowledge,”^[197] which is a logical assumption.

Bibliometrics is the analysis of the structure of literature using various tools, counting, rank-frequency distributions, and citation analysis; and although the structure of literature is basic to all disciplines, it is particularly important in the area of information retrieval.

Hulme’s original idea was, in reality, a theory to show a possible trend or development in science by means of literature, but it was not a structure study. Gross and Gross, making a supposition about the structure of literature, developed a rank-frequency distribution from citation counts to indicate relative quality of journals; but this was a very primitive study of literature structure. Fussler’s study was an extension of the Gross and Gross idea. Kessler and Small developed excellent bibliometric tools for analyzing literature structure, and based on the same supposition as the Gross idea, these tools for studying relationships have far-reaching implications. No distinctly different technique has been produced since cocitation by Small in 1973, clustering and graphing being procedures using bibliographic coupling and cocitation. The many other articles since 1973 seem to be evaluations, applications, or analyses of investigative processes in attempts to describe more fully or support or duplicate previous research.

It seems evident that bibliometrics, which was first used in attempts to evaluate journals for collection development in libraries, has been recognized and expanded to the study of the structure of literature in the larger encompassing field of information science. At the present, it is composed of methods and techniques without a coordinating theory; but it seems possible that as more theoretical information is converted to fact, and behavioral patterns are established for the assessment and evaluation of the structural components of literature (i.e., authors, publications, words, and laws) and their relationships, the

more probable causal explanations will be evident and bibliometrics will be closer to being recognized universally as a science.

Bibliothèque Nationale de France

Noémie Lesquins

Scientific Mission (DSR), National Library of France, Paris, France

Abstract

With more than 10 million volumes and an annual increase of about 50,000, the Bibliothèque Nationale de France is one of the biggest libraries in the world. It is also one of the oldest and since the sixteenth century, it has been entrusted with the mission of collecting, cataloging, preserving, and providing access to the French print heritage. Although the library's history consists of several turning points, the last decade of the twentieth century has brought an unprecedented change in the life of the institution: new information technologies, new buildings, new collection management politics, and new services. More than ever, today the library is part of a national and international network of libraries and other cultural institutions whose goal is both to share the wealth of their resources and assert their identities.

A SHORT HISTORY OF THE PAST: FROM THE BIBLIOTHÈQUE ROYALE TO THE BIBLIOTHÈQUE NATIONALE

The Royal Library

The origin of what is now known as the Bibliothèque Nationale de France is the French kings' own private libraries. The most famous one is King Charles V (1364–1380) own collection, composed of 917 manuscripts and cataloged in 1343. In 1368, a specific space in the Louvre was built for this collection. Yet, according to the tradition, it was dispersed in 1380 after its owner's death. The first step to the creation of a royal library was made by Louis XI (1461–1483) who donated his private library to his heir. The new principle was respected by his followers. As the consequence of the advent of printing, the library expanded in the fifteenth century, and a 1622 inventory reports a volume of 4712 manuscripts and prints.

It is under François the First's reign (1515–1547) that a major decision was made to order any printers and booksellers to deposit copies of all books printed or sold in the kingdom. Although this law was not fully enforced in the beginning, the 1537 "Ordonnance de Montpellier" marks the birth of the legal deposit (*dépôt légal*) that remains one of the major missions of the Bibliothèque nationale de France to this day.

From the fifteenth to the seventeenth century, the library was housed in various royal palaces. Transferred from Paris to Amboise, from Amboise to Blois, from Blois to Fontainebleau, it was finally moved back to Paris at the end of the sixteenth century. In 1666, Colbert, Louis XIV Prime Minister, decided to move it into two of his own private residences located on rue Vivienne. In the following decades, that location was extended to the entire block on the rue Richelieu, rue des Petits-Champs and rue Colbert, where parts of the collection are still stored.

The constant expansion of the library in the seventeenth and eighteenth century was mainly due to a determined acquisition and gift policy. Nicolas Clément, librarian of the king in 1670, invented a classification based on 23 letters corresponding to subjects, from religion to literature, including history, arts, sciences, law, and foreign languages. It was used until 1996. The collections were enriched not only with books and manuscripts but also with medals and engravings, hence the creation by the Abbé Bignon, librarian of Louis XV, of the first departments in 1720: Manuscripts, Printed Books, Titles and Genealogy, Engraved Plates and Prints, and Medals and Stone Engravings. Parts of the collections were already open to scholars, but in 1720, the Abbé Bignon extended the access to the general public one day a week, from 11 A.M. to 1 P.M.

The French Revolution changed the contents and structure of the Library tremendously: around 250,000 books, 14,000 manuscripts and 80,000 engravings were confiscated from religious congregations and aristocratic families to be added to the collections, and a 1794 decree changed the Bibliothèque du Roi into the Bibliothèque Nationale.

The Bibliothèque Nationale Throughout the Nineteenth and Twentieth Century

Although its name was changed to Bibliothèque Impériale under Napoleon the First (1804–1815) and Napoleon the Third (1852–1870) and to Bibliothèque Royale under the Restoration (1814–1830) and the Monarchy of July (1830–1848), the library structure and mission kept developing in the same direction whatever the political system was.

The nineteenth century was for the Bibliothèque Nationale, as well as for many other great libraries worldwide, an important time of development in building and

cataloging. With the constant increase of the collections, the lack of space became one of the major issues in the middle of the nineteenth century. In 1862, Napoleon III commissioned the French architect Henry Labrousse (1801–1875) to renovate some of the original buildings, the Hôtel Tubeuf and the Galerie Mazarine, and to build new premises on the rue de Richelieu and rue des Petits-Champs. His most famous work for the library is the Printed Books Reading Room, inaugurated in 1868 and well known as an avant-garde masterpiece of cast-iron architecture.

At the same time, making inventories of the collections became a priority. Head librarians Joseph Naudet (1840–1852), Jules Taschereau (1852–1874), and Léopold Delisle (1874–1905) devoted most of their time and energy to cataloging. Catalogs of medical sciences and of French, British, Spanish and Portuguese, Asian, American, and Oceanic history were first compiled, followed in 1897 by Léopold Delisle's General Catalog of Printed Books (*Catalogue Général des Livres Imprimés*) that was continued throughout the twentieth century until the computerization of the catalog in the 1980s.

Expansions continued throughout the twentieth century, especially under the governance of Julien Cain from 1930 to 1964, to house current holdings as well as rare and precious pieces and to provide access to the public. A new catalog and reference room was built in 1935–1937, and a periodicals room in 1936; special departments (Engravings and Maps and Plans) were moved within the Richelieu block to free up space for the Printed Books Department; new departments were created to preserve and collect newly formed collections, such as oriental manuscripts and music and sound archives; decentralized annexes were created in Versailles in 1934, 1954, and 1971, in Sablé (200 km west of Paris) in 1980, and in Provins (east of Paris) in 1981.

Several laws and decrees managed to improve the legal deposit process and extended it to new materials. Since 1943, printers have the obligation to deposit in regional libraries copies of any material (books, periodicals, flyers, postcards, posters, etc.) printed in the country. The scope of the obligation was extended to imported books; photographic, cinematographic, and sound materials in 1925 and 1943; audiovisual items in 1975; and computer resources in 1992. In 1880, 12,414 prints were deposited; in 1993, the number reached 45,000 volumes.

With the computerization, the increasing readers demand, the growth of published material, and the pressure of new conservation requirements, among which is the urgent treatment of brittle and acid paper and the conservation of new media, the Bibliothèque Nationale had to face the issues of equipment, staff, and space at the dawn of the twenty-first century. A great debate in the 1980s finally ended with the decision by President François Mitterrand (1981–1995) to build a new library.

THE BIBLIOTHÈQUE NATIONALE DE FRANCE

History of the Project

The official launch of a new national library project dates back to the traditional Bastille Day presidential speech made by François Mitterrand in 1988, in which he announced “the construction and development of one of the, or maybe the largest and most modern library in the world.” The ambitious project was defined as such: “the role of this great library will be to cover every field of knowledge, to be accessible to all, to make use of the very latest data transmission technologies, to provide for remote document consultation, and to forge links with other European libraries.” A planning committee, the *Établissement Public de la Bibliothèque de France*, was commissioned for the planning for the new institution, including the international architectural contest, the construction schedule, and the collection and staff management. Although it was first planned to transfer into the new building only the collections printed after 1945, the final decision was made to transfer all prints into the new building, when the special departments would remain in the old site.

In April 1989, the location for the new building was chosen by the river Seine in a southeast area of Paris called Tolbiac. The international architectural contest was chaired by the American architect I. M. Pei. Four projects were selected by the jury and presented to the French President who finally chose the French architect Dominique Perrault on August 21, 1989. Dominique Perrault's project consists of four glass towers symbolizing four open books built on a wooden esplanade and surrounding a deep patio with a garden. On the east and west sides of the esplanade, two escalators provide access to entrance halls from which readers can reach either the reference library reading rooms on the upper level or the research library on the lower level. The project and its final result triggered and is still the topic of a great polemic, especially on the storage of books in glass towers.

On January 3, 1994, a decree merged the Bibliothèque Nationale and the *Établissement Public de la Bibliothèque de France* into a single institution, the Bibliothèque Nationale de France. The keys to the building were officially given by the architect on March 23, 1995, and the reference library was opened on December 20, 1996. After 2 years, during which most of the collections held on the Richelieu site were transferred to the new Tolbiac site, the research library was finally opened on October 8, 1998. A new site was also built by Dominique Perrault in Marne-la-Vallée (20 km east of Paris) for conservation, preservation, and restoration.

This great project presented an opportunity to modernize a century-old library that could not afford to miss the technological turn that revolutionized the information

world in the last decades of the twentieth century. It helped the library to improve its services to the public and to the national and international library community.

Mission and Organization

The Bibliothèque Nationale de France is in charge of five major national missions: acquiring and cataloging collections (through legal deposit, acquisitions, exchanges, gifts, and donations), preserving the collections (through preventive conservation, restoration, duplication), providing the public with access to the collections (inside the library within its 24 reading rooms as well as outside through the Digital Library and remote duplicated document delivery), highlighting the collections (through education and exhibitions programs, publishing, and other cultural activities), and last but not least, cooperating with national and international libraries and institutions (through conservation sharing, acquisition sharing, information and expertise sharing, and the creating of union catalogs).

As most cultural institutions in France, the Bibliothèque Nationale de France is a public institution. Both the President and General Director are named by the government, and most important decisions are made under the control both of the Ministry of Finances and of the Ministry of Cultural Affairs (Ministère de la Culture et de la Communication), more precisely of the Book and Library administration (Direction du Livre et de la Lecture). Funding is also mainly public: in 2001, the French state provided the library with a 105.8 million Euro budget, to which 23.7 million Euro from grants, donations, and internal resources were added. Yet, private funding is an essential and a major resource for the acquisition of special collections such as the manuscripts of Chateaubriant's *Mémoire d'Outre-tombe* bought in 2000 or of *Voyage au bout de la nuit* by Louis-Ferdinand Céline bought in 2001 for 11 million francs (1.67 million Euro).

Today, the Bibliothèque Nationale de France has more than 2800 employees. Three main directors rule the Library: the Staff Director, the Collection Director, and the Services and Networks Director. Furthermore, four delegates to the General Director are, respectively, in charge of a Development Office, a Bureau for International Affairs, a Bureau for Communication, and a Bureau for Cultural Activities. Two committees assist the President of the library with all administrative and scientific decisions. A financial service linked to the Ministry of Finance centralizes, distributes, and controls the resources and expenses of the establishment.

Although the collection was formerly divided according to the material type (prints, periodicals, audiovisual, photographs, etc.), it is now divided into four print collection departments based on disciplines (Philosophy, History, and Human Sciences; Law, Economics, and Political Sciences; Science and Technology; Art and Literature), one special department for Rare Books (Réserve

des livres rares), seven special departments based on material criteria and partly inherited from older departments (Manuscripts; Prints and Photographs; Maps and Plans; Coins and Medals; Music and Opera; Performing Arts; Audiovisual Collections) and two departments that are special libraries onto themselves with their own site (Bibliothèque-Musée de l'Opéra and Bibliothèque de l'Arsenal). A specific Department for Bibliographic Research is also under the supervision of the Collection Director.

Print and audiovisual collections were transferred to the Tolbiac site; the rest was left at their original sites.

Public and Collections

Tolbiac site

One of the key features of the new library site, also known as site François-Mitterrand, is opening its doors to the general public, when the Bibliothèque Nationale was traditionally for researchers only. Because it is not possible to provide the large number of people with access to the whole national print heritage, among which are rare, sometimes unique, and fragile pieces, the Tolbiac site is composed of two reading rooms levels: the upper level with a reference library open to any person over 16 and the lower level with a research library open to only authorized readers. Among the average 3000–3500 readers who come to the library everyday, about two thirds, mostly students, use the reference library and more than one third use the research library.

The reference library is composed of 10 thematic reading rooms providing 1700 seats. The 280,000 volumes of books and periodicals with an encyclopedic coverage of a first academic degree level are stored on open stacks and classified with the Dewey system as in many public libraries. Most of them are in French, but a wide range of foreign languages, such as English, German, Spanish, Italian, Portuguese, and also oriental languages is well represented. In every reading room, computers provide access to the library catalog (up to 8 million records), about 250 CD-ROMs and databases (bibliographic indexes, directories, dissertation abstracts, union catalogs, dictionaries, encyclopedias, etc.), a growing number of electronic periodicals, and the Internet. Admission to the research library is given only after an interview with a librarian who evaluates the needs of the user. Dealing with both of its missions of preserving and providing access with the national printed heritage, the Bibliothèque Nationale de France is considered a library of “last resort.” The collection of print materials is composed of 11 million volumes of books, among which 200,000 are kept in the Rare Books Department, and of about 350,000 periodicals titles, among which 32,000 are current ones. They have mostly entered the library through legal deposit and exchanges and are kept in closed stacks, either on the top

11 floors of the towers or on the basement level near the reading rooms. Every reading room of the research library also has open stacks holding about 330,000 volumes bought by librarians to compose the lower level open access reference library.

The library information system oversees the catalog and the documents and reading seats reservation system that is linked to an automated document delivery system made of 8 km of tracks and 150 delivery stations. Documents can be sent from any storage to any of the 14 reading rooms of the lower level in about 45 minutes.

Digitization has become an opportunity for libraries to duplicate and protect the original collection. Besides the 100,000 printed works and 300,000 fixed images that have been digitized, the library owns about 76,000 microforms and 950,000 microfiches that are substitutes for the documents.

The Department of Audiovisual Collections is the only special department on Tolbiac site. It covers all disciplines on audio, visual, and electronic material deposited by publishers. This collection of 50,000 multimedia documents, 900,000 sound recordings, and 90,000 video recordings is complementary to the Institut National de l'Audiovisuel (National Institute for Audiovisual) holdings that are also housed on the Tolbiac site and mainly consist of TV and radio legal deposit.

Richelieu site and the other libraries

Five special departments are still housed in the old Bibliothèque Nationale site, rue de Richelieu: Manuscripts (with a collection of 225,000 Western and Oriental volumes of manuscripts and xylographs), Engravings (with a collection of 12 million engravings, photographs, posters, and postcards), Maps and Plans (with a collection of 890,000 maps, atlases, reference documents, and globes), Coins and Medals (with a collection of 530,000 coins, medals, and antiques), Music (with a collection of 2 million music documents and recordings).

These departments are associated with other libraries that joined the national library. The Music Department is in charge not only of the collection housed in Richelieu but also of the Bibliothèque-Musée de l'Opéra housed in the Opéra Garnier building and composed of 130,000 prints and 240,000 special materials. The Bibliothèque de l'Arsenal (1 million prints and 120,000 special documents), which opened in 1797 and was originally composed of two precious encyclopedic collections owned by two members of the royal family, was annexed to the national library in 1934 and established as a department in 1977. It is well known among bibliophiles for its rare and precious editions and bindings. The Arsenal site also houses the Performing Arts Department (2.4 million objects and documents), which was created in 1976 after collector Auguste Rondel's donation and opened an annex in the Maison Jean Vilar in Avignon in 1979. A project for

the National Institute for the History of Art (Institut national d'histoire de l'art) composed of a reference and research library and of an academic research section has been in development since the late 1990s on the Richelieu site. It consists of the merging of three major art libraries (Bibliothèque d'Art et d'Archéologie, created after Jacques Doucet's private collection; Bibliothèque Centrale des Musées Nationaux, and Bibliothèque de l'École Nationale Supérieure des Beaux-Arts), providing free access to 550,000 volumes in the famous salle Labrousse. The École nationale des Chartes and its library, mainly specialized in medieval history, is also associated with the project. This institute is meant to be complementary with the Bibliothèque Nationale de France precious collection, which is being reorganized while the buildings and preservation conditions are being modernized. The former periodicals reading room of the Richelieu site, also called salle ovale, is meant to become in the coming years another reference library providing the large public with access to all the library digitized and microfilmed collections.

A LIBRARY FOR THE TWENTY-FIRST CENTURY

The Library on the Web

In the 1980s, the development of new information technologies enhanced a major evolution in the library world. Remote services are part of all contemporary libraries' missions and duties, especially those libraries with a national and international role. The new project for the French national library was an opportunity to define new missions, complementary to the traditional ones and based on technological progress. Twenty years later, the Bibliothèque Nationale de France has developed two major information tools that will continue to develop and grow: the Web site and the Digital Library.

The Bibliothèque Nationale de France Web site, <http://www.bnf.fr>, was created in 1996. It contains about 100,000 pages and provides information, services, and bibliographic products for the Internet public, the actual library's users, and the national and international community of librarians and publishers.

Information to the general audience mainly takes the form of a repertory of Internet resources called "Les Signets de la Bibliothèque Nationale de France" (the Bibliothèque Nationale de France Internet bookmarks) that are classified, enriched, and updated by specialized librarians. Service to the readers and researchers is based on the integrated information system that gives them the possibility to search in catalogs (BN-OPALE PLUS for printed material and BN-OPALINE for special collections), reserve a seat on Tolbiac site, order documents, or ask for duplication on various material (color or black and white photocopies, microfiches, microfilms, facsimiles,

slides, photographs, digitized images on CD-ROM or on disk, etc.). Information and services to the library and publisher community cover various activities: bibliographic standards (ISBD and ISSN recommendations, MARC formats); legal texts (legal deposit laws and decrees); bibliographic products (subject headings lists, catalogs, French National Bibliography online with the possibility to download records); and general information about the library (annual reports, legal deposit activity, and national and international cooperation and partnership).

In 2001, the Bibliothèque Nationale de France Web site was visited around 14,300 times every day by 11,700 different users (41% are located in France, 17% in Canada and the United States, 3.5% in Italy, and 38.5% in the rest of the world). An average number of 90,700 pages were looked at every day, mostly the catalogs and the Digital Library.

The Bibliothèque Nationale de France Digital Library, Gallica, was launched in 1997. It was reorganized in 2000 and includes in 2002 a free of right collection of 80,000 fixed images, several dozens hours of sound recordings, and more than 60,000 printed volumes. Most prints are digitized in image format, but all tables of contents can be accessed in text format as well as about 1250 documents, such as reference books, classical literature, and rare editions. In 2001, about 4500 Internet users entered Gallica every day, and 10 million pages were downloaded every month.

Gallica complements the virtual exhibitions and the Internet education programs also available on the Library's Web site. The Digital Library growth is based on 3-year digitization programs of 20,000 prints and 80,000 fixed images selected according to two major directions: completeness of the cultural heritage and encyclopedic library (new authors, dictionaries, and periodicals) and development of thematic projects such as Traveling (in France, in Africa, in Italy, etc.), Memories of the Bibliothèque Nationale de France (a selection of material of an outstanding research and art value), and special collections (illuminated manuscripts, incunabula, Philidor collection in partnership with the Library of Versailles, Gaignières collection in partnership with the Bodleian Library, Dunhuang collection in partnership with several foreign institutions coordinated by the Mellon Foundation).

National and International Cooperation and Partnership

Institutional and human networks based on expertise, financial resources, and documentation sharing are key priorities of the Bibliothèque Nationale de France.

Since 1994 a partnership policy based on long- or short-term programs has been created under the name of "réseau des pôles associés" (partner institutions network).

Every partner institution, mostly libraries or groups of libraries, signs an agreement with the national library displaying the cooperation patterns. In 2002, there are 64 «pôles associés», representing 71 institutions. Among them, 20 are city libraries, 18 are academic libraries, and 33 are research institutions, museums, or record offices.

Collecting and preserving the national heritage is one of the partnership's purposes: in 1996, agreements with 25 regional libraries and record offices were drawn up to reinforce the effectiveness of printer legal deposit and to enhance links between national and local copyright systems. Cross-control helps all partners to improve their collection depth.

Developing specialized collections of a high research level is a second purpose: seeking to ensure a comprehensive national coverage of the world's knowledge, the Bibliothèque Nationale de France shares its collection development policy with 39 libraries (23 located in Paris and its vicinity, 16 are spread out all over the country), mostly academic and research libraries that specialize in various disciplines or documents, from medieval art to biomedical engineering, from comics to posters. The library partly helps its partners financially.

Improving access to resources is the other action led by the Bibliothèque Nationale de France in cooperation with other libraries for the benefit of scholarship and research: The French Union Catalogue (Catalogue Collectif de France) was inaugurated on the Web in May 2001 and is composed of a National directory of libraries and document centers (Répertoire National des Bibliothèques et Centres de Documentation, RNB CD) providing detailed practical and technical information on more than 3500 French institutions and of 13 million bibliographic records from three major databases: the Bibliothèque Nationale de France's print collection catalog (BN-OPALE PLUS), the academic libraries union catalog (SUDOC), and a reservoir of bibliographic records resulting from a retrospective conversion program for handpress books held by city libraries. This recon program was also partly funded by the Bibliothèque Nationale de France.

Other services, such as shared digitization programs or remote document supply, are also developed.

Dealing on a large scale with most of librarianship issues, the Bibliothèque Nationale de France also shares resources and expertise with other similar institutions within international organizations. It is a member of various organizations promoting French language around the world and helping French-speaking countries to do so. Through a continuing professional education program, it provides French-speaking librarians from developing countries with training in particular domains of librarianship and in new fields of technology. An active cooperation network was also built in the past decades with French-speaking Canadian librarians, mostly from the Bibliothèque Nationale du Québec (BNQ) and the University of Laval to share information, documentation,

internships, and bibliographic records. Translating English-speaking library reference tools such as subject headings, ISBD, Dewey classification, and editing a French-speaking national libraries directory (Le Répertoire des Bibliothèques Nationales de la Francophonie) providing information on national libraries or equivalent institutions in not less than 43 countries, are some of the main actions led in that field of cooperation.

Before it was even built, the Bibliothèque Nationale de France had a mission to "forge links with other European libraries." Many collaborative projects are initiated by the Conference of European National Librarians (CENL) and funded by the European Commission. Among their programs, the Bibliothèque Nationale de France plays an active part in Biblink (Linking Publishers and National Bibliographic Services), Bibliotheca Universalis (a G-7 global information society pilot project), CD-BIB (National Libraries Project on CD-ROM), CoBRA (Computerized Bibliographic Record Actions), EROMM (European Register of Microform Masters), NEDLIB (Networked European Deposit Library), and RENARDUS (a project that aims at improving access to existing Internet-accessible services across Europe) and participates with various other organizations (The Ligue des Bibliothèques Européennes de Recherches, LIBER; the Consortium of European Research Libraries, CERL; the European Bureau of Library, Information, and Documentation Associations, EBLIDA) in actions promoting the interests of research libraries and academic users and mainly consisting in the making of shared catalogs and bibliographies.

Last, but not least, collaborating with libraries worldwide is another role of a national library. Within various specialized organizations, the Bibliothèque Nationale de France makes its contribution to international research on specific librarianship issues: computer files ISBD, permanent UniMARC, preservation and conservation within the IFLA, Russian and Mediterranean libraries projects in the UNESCO, bibliographic standards within the International Standardization Organization (ISO), and the International Standard Serial Number (ISSN), and on more specific collection issues within (e.g., the International Federation of Film Archives (FIAF)), the International Association for musical libraries (AIBM/IAML), or the International Council of Museums (ICOM).

The last decade of the twentieth century has been an important turn in the life of the French national library. The Tolbiac project played a pivotal role in the institution's growth and helped it to make up for lost time. The impact of new technologies in knowledge and collection management mainly consisted of the improvement of services, both inside the library and outside its physical frontiers. As any other national library, the Bibliothèque Nationale de France has now both dimensions of a keeper of the past and an initiator of innovating projects.

Binding [*ELIS Classic*]

Lawrence S. Thompson

University of Kentucky, Lexington, Kentucky, U.S.A.

Abstract

Lawrence Thompson has written extensively about bibliography and the history of books and printing. He contributed many articles to the first edition of *ELIS*, including this one on Binding. The binding of books is one of several book arts, as Thompson's discussion reveals.

—*ELIS Classic*, from 1969

INTRODUCTION

The binding of books is both a craft and an art. The forwarding of books (all the processes of binding before lettering and decoration) is a craft requiring a high degree of technical skill and a considerable fund of information about the materials and processes used in book production during all periods of history. Finishing (decoration of the cover in various styles) is an art in which some gifted binders of the past have attained substantial heights of achievement, comparable to artistic creativity in other media.

OVERVIEW

A binder's equipment and tools must be kept in an orderly manner, for a job can easily be ruined in a poorly organized shop. Minimum equipment consists of the bone folding stick (in constant use for many purposes), a pair of 6-inch scissors, a paste pot (earthenware is customary), a glue pot, which will hold about a pint, a glue brush (round, about 1 inch), a flat paint brush for the paste pot (about 1 1/2 inch), a cobbler's knife, a package of bookbinder's needles, a wooden sewing frame, a flat piece of marble or stone about 10 × 15 inches for doing any work which requires a firm surface (old toilet partitions are ideal), a lying press made of beechwood blocks and moved with wooden screws, a plough for cutting edges in the lying press, a backing hammer, a cheap board cutter, and, if possible, a standing press (in which to press books for drying, thus freeing the lying press for routine work in progress). A power cutter, two or three "finishing" presses, a tooling stove (for the finisher), an electrical paring machine, and a power-driven device for sharpening knives and shears are examples of other equipment that the more experienced hand binder may need.

When a binder receives a volume, his first task is collation, and if he deals with printed books from the fifteenth through the eighteenth centuries, he is likely to need to

know something about descriptive bibliography. Further, the folding of printed sheets is a process that requires meticulous care and competence in collation. If a book is to be rebound, it must be "pulled" (i.e., separate cover from text and remove old cords and tapes and the old glue, often a tedious process). If folds of old books are damaged, a "guard" (a narrow strip of paper used to repair a damaged fold, or to attach a plate or a single leaf) may be necessary. Special techniques are involved in guarding and mounting maps and folded sheets. A similar problem may arise in the case of pages of new books that are incorrectly printed. These pages must be cut out from the entire sheet, or "cancelled," and the corrected page supplied by the printer must be tipped in.

Before sewing, the pages of a book must be pressed firmly, both to expel air and to crease the folds of the sheets. If there is to be no edge-decoration or "rough-gilding," books may be trimmed before sewing. However, a book must be "cut in boards" if there is to be a smooth gilt edge, a marbled edge, gaufering, or a fore-edge painting (marbling is largely passé, gaufering and fore-edge painting are now essentially *tours de force*). Gilding smooth edges (see below) is a highly specialized technique, and application of gold leaf is a tedious and delicate operation.

There are various styles of sewing. Most primitive of these is stabbing, and the earliest codices were held together in this manner. In Western Europe and America small items were sold without covers and stab-stitched through the eighteenth century; and some modern American textbooks with wide inner margins are still sewn in this manner. With the rise of parchment as a writing material in the early Middle Ages, a much tougher material, which could be folded, was available. Threads could be put through holes in the folds. This process of sewing on raised thongs or cords goes back to the tenth century in northern Europe. Today large books (e.g., pulpit bibles) are generally the only works sewn in this manner, although imitation raised bands are commonly used to lend the illusion of luxury. Recessed thongs or cords were

first used in the sixteenth century as a step toward automation, since it is quicker and cheaper than raised-cord sewing (not for the aesthetic qualities of a smooth spine). “Two-sheets-on” sewing, a device in which each length of thread holds two sections instead of one, was used from the beginning of the seventeenth century until the latter part of the nineteenth, when sewing machines began to be used widely in commercial binderies. It is to be contrasted with the method of passing the thread continuously through all sections, from beginning to end, without a break. Oversewing (also called “overcasting” or “whipstitching”) was developed in the eighteenth century to hold heavy plate books together firmly. It is a method for making a series of sections, then sewing all along them. Oversewing machines are the mainstays of modern library binders. They have produced many an expendable book that has been circulated far more times than a hand-sewn book would have been used; but it has also resulted in the virtual destruction of many fine books sent out for rebinding by injudicious library binding assistants.

Regardless of the sewing method used, the sewn book must be “knocked-up” to be square at head and spine, and the expansion resulting from the sewing can be reduced by hammering along the back edges. The spine is glued with a thin hot glue (still preferable to the yet untested plastic product) diluted with some insecticide such as DDT, the book again “knocked-up” to round the spine, and the spine lined. Preparation of cover boards for the case requires exact measurements, lining-up (to prevent the pigmentation of the boards from showing through the end papers), marking the boards for sewing, and marking the boards for tapes.

End papers (sheets before and after the text of a book) may or may not be decorated. The classic type of decorated end papers is marbled, presumably originating in Japan in the twelfth century A.D., and reaching Europe via Persia and Turkey. By the end of the sixteenth century marbled paper was used in the Netherlands, and its use spread eastward and across the Channel in the next century. The oriental *serefsan* (gold-flecked) papers, used for end papers as well as texts, is a variation of marbling that has been given little attention, although *serefsan* has been used imaginatively by many oriental calligraphers and binders. “Dutch gilt” (or “Dutch flowered”) papers were produced in Germany and Italy in the eighteenth century, imported into the Netherlands, then exported to France and England. They were not marbled, rather printed by engraved rolls, wood-blocks, or incised metal. In the twentieth century, Douglas Cockerell^[1] and a few Parisian and Scandinavian binders (especially Ingeborg Börjesson) have produced marbled papers of distinction.

Commercial binders often use maps, engravings, or pertinent photographs (generally reproduced by offset) for end-paper illustration. A classic variation of the end-paper is the doublure or lining of silk, leather, or other material in lieu of end sheets. The Islamic doublure of the fifteenth century had a strong influence in Europe and was

well known on the continent beginning in the sixteenth century. Leather doublures were common in England and Western Europe from the latter part of the eighteenth century on (see Boyet, below). Most doublures are plain, although fairly elaborate borders are common. Since the first and last sections of a book are the weakest, and since elaborate doublures need added protection, leather hinges, either sewn in with the end papers or pasted down on the end papers, are usual in bindings with doublures. Linen hinges are often used for more common bindings.

Trimmed edges may be handled in different ways. In the middle ages each leaf was trimmed separately. In the sixteenth century the proliferation of books through printing required smooth trimming of edges. At this time we have the beginning of edge-painting (e.g., the Pilone Library; not fore-edge painting as yet, simply edge-painting), and gaufering (decoration of the edge with a tool on the gilded edge). In the middle of the seventeenth century the fore-edge painting (an image under a smooth gilt edge, visible only when fanned out) came into vogue. Floral, heraldic, and landscape themes were popular with fore-edge painters of the eighteenth and early nineteenth centuries. The art has become less popular in the twentieth century, but it is still practiced with vigor and imagination by such artists as the elder Joseph Ruzicka and Kenneth Hobson. Edge marbling was common in the eighteenth century, by the same method as the one used for marbling flat paper, by transfer via solution in muriatic acid, or by rollers. Sprinkling, most frequently with Venetian red, has been used in Europe since the sixteenth century and is still a characteristic of law books. “Rice marbling” is a similar process.

Traces of headbands may be found as early as the seventh or eighth century in the well-preserved Stonyhurst Gospel. The headband as we know it in modern books is in colored silk or thread. Beading shows at the bottom, and turned-in leather of the spine forms a hood. Sixteenth-century binders used this style, and it is still in vogue. In the nineteenth century the more sought-after hand binders used fine silks and elaborate patterns, and some quite handsome work was produced. Stuck-on headbands have been used since the sixteenth century, but the best hand binders of all periods have sewn them on to the spine.

Up to the nineteenth century most books were bound with “tight backs” (covering material attached firmly to the spine, or sandwiched between cover and spine when there are additional layers of material). “Hollow backs” permit leaves to throw up in the middle, and the outer spine is not folded or broken. Hollow backs began to be used widely in Europe at the end of the eighteenth century and became the order of the day after about 1820. “Spring backs,” “capable of retaining a firm situation” (patent granted to John and Joseph Williams, ca. 1799), are used in ledger bindings.

Leather was the primary covering material for books until the third decade of the nineteenth century, when

commercial publishers began to use cloth on a production-line basis. Goatskin, sheepskin, and calfskin have been the usual materials, although other sources of leather are known, ranging from weasel skin for a set of Lenin's collected works, to human skin (e.g., from Confederate soldiers, used by a Unionist Army surgeon to bind his texts and manuals, now in the College of Physicians and Surgeons in Philadelphia). Calf was popular in the sixteenth century, sheep in the seventeenth and eighteenth. Careless tanning methods have resulted in the virtually complete deterioration of hundreds of thousands of bindings. Straight-grained morocco was widely used in the eighteenth and early nineteenth centuries and is still in use today, since it does not show scratches and other damage as plainly as other leathers. Russian leather, originally prepared in and imported from Russia, is made from calf or cowhide; it was widely used in England, North America, and Western Europe since about 1730.

Embroidered covers were used for fine bindings in the Tudor and Stuart periods in England, possibly even as early as the late fourteenth century (Anne de Felbrigge's putative binding of her manuscript Psalter). Jeweled bindings, based on metal plates covered with enamel or with plaques in ivory or other metals, and in-laid with jewels, were the deluxe book covers in France and Germany from the sixth to the fourteenth centuries. In the twentieth century Sangorski and Sutcliffe and a few other hand binders have produced jeweled bindings, but tax laws and customs "finkishness" have discouraged hand binders from working in this area.

Clasps are a practical device for binders who use vellum, a material likely to curl in almost any climate. However, all books and leathers may curl, and clasps are practical for all types of bindings. Far Eastern and Islamic binders have used an ivory pin on a strong ribbon, to be inserted into a loop on the front cover. Some surviving Coptic bindings have a simple strap that can be fitted to the fore-edge of the front cover. Holes and pins were used in Europe until the fourteenth century, when metal clasps and catches began to be used. A significant key to bibliographic description is the position of clasps and catches: in the Low Countries and the Germanies the clasps were fitted to the bottom cover, the catch on the front cover. In France and England these positions were reversed.

Bosses were put on covers in the Middle Ages to save the decorations from wear and tear resulting from pushing over tables or shelves, or possibly from an overflow of sacramental wine (German student *Kommersbücher* of the nineteenth century were provided with bosses to elevate the covers a millimeter or so above the beer spilled on the *Stammtisch*). A related practical device was the chain, and *catenati* are still to be seen at Wimborne and Hereford. The length of chains ranged from three to five feet. Chains served less to prevent theft than to avoid abuse of books.

The earliest technique of finishing is blind tooling, impression of tools on leather (generally wet), without

use of gold or color. Coptic bindings of the seventh century show evidence of widened blind tooling. Blind tooling was always in use; and all surviving romanesque bindings of the twelfth and thirteenth centuries are in blind, with the exception of a French binding of the early thirteenth century on which there are traces of gold. Gothic bindings of the fifteenth and sixteenth centuries reveal much greater variety of stamps and rolls. A peculiar laborsaving technique developed at this time was the large panel stamp, a device that often provided a convenient medium for imaginative artistic expression. The panel stamp originated in the Netherlands and was used there throughout the fourteenth century, and during the fifteenth and first half of the sixteenth centuries it was used widely by binders all over Northern Europe. Impressions were almost invariably in blind. A related device was developed in commercial binderies of the late nineteenth century, the "butter stamp," which could be applied to the whole spine of a book and decorate it with one impression.

Related to the panel stamps as a decorative device is the supralibros, or superexlibris, stamped in the center of the front cover to indicate ownership. It was used in France from the sixteenth century on, and it spread from that country to the rest of Europe. Generally the supralibros is the armorial device of the owner, but it may also be a monogram or some other device indicating ownership. Unfortunately, some armorial bindings are forgeries, since a binder might retain the stamp and use it on books not belonging to the rightful owner of the device. When provenance lends value to a book, binders with a low level of scrupulousness have been tempted to make improper use of a supralibros stamp. The supralibros is generally tooled in gold leaf.

Blind tooling has had spurts of popularity with certain binders or schools (e.g., the "ecclesiastical" or "divinity" style in Victorian England), but after the middle of the sixteenth century it was largely restricted to cheap leather bindings on trade books. Another finishing technique, practiced mainly in Germany during the Gothic period, but still used occasionally, is *cuir ciselé* (also called *cuirbouilli*; German, *Lederschnitt*; incised leather). Under this method no elaborate dies were needed, for the leather was simply cut and then worked so that it stood out in relief.

Gold tooling *à petits fers* seems to have been a Moorish invention developed in Córdoba and was probably imported into Christendom via Naples in the late fifteenth century. Applying gold leaf with a hot tool was not a Venetian art, for binders in Venice simply followed the usual oriental manner of painting the impressions made by blind tooling. In any event, the art of gold tooling was used by Italian binders in the early sixteenth century and quickly spread to France. In both countries, bindings produced in this period show a high level of artistic achievement. Gold tooling did not spread to the Germanies and other parts of Europe until somewhat later. Much early

gold tooling was rather crude, but techniques improved gradually. Today virtually every design is drawn or tooled on thin paper, which is then positioned on the cover as a guide for the heated tools. It is said that the great English binder Roger Payne (1738–1797) first used paper patterns, and the accuracy of his tooling would tend to confirm this attribution. However, they did not come into common use until a generation after Payne's death, and we cannot safely give him certain credit for this invention.

Gold leaf is applied after the leather has been neatly smeared with glaire (or glair, white of egg). The dry leather is greased and covered with gold leaf, and the pressure of the hot tool causes the gold to adhere to the leather by the coagulation of the glaire. Pure egg white is generally altered with various other liquids, ranging from spirits of wine to vinegar, ammonia, salt, and camphor to avoid putridity. Today dried albumen is most generally used, since it works as well as fresh eggs and is far more convenient. Among oils used for binding, hog lard, palm oil, and Vaseline have been used. (But neither Vaseline nor any other mineral oil should ever be used for rubbing bindings.) Some soft unabrasive material such as flannel lightly sprinkled with olive oil should be used to clean off the leather after tooling.

"Smooth gilding" (in contrast to "rough gilding," see above) is an operation much like gold tooling and appeared on the European scene about the same time or a little later. It requires consummate patience and exactness of technique, and in large shops there are gilders who do nothing else. An essential step in edge-gilding is careful burnishing with an agate burnisher once the gilding is thoroughly dry. The purpose of gilding is protection of a book from the penetration of dust, and it is essential for the protection of fore-edge paintings.

There are devices other than tooling in gold or blind for decorating book covers, and we even have such bizarre examples of decoration as the Argentine *nonato* binding (skin from the foetus ["not born"] of an Argentine pampas calf, with hair left on). There are highly sophisticated uses of intarsia (inlay), a technique used as early as the 1560s by a French binder for achieving polychromistic effects with various colors of leather. In the twentieth century inlay has been used with grace and imagination by a number of master binders. Much "inlay" is actually "onlay," since the base leather is not cut, but rather impressed with the design and the impressions filled with cutout pieces of the desired color.

Certain other devices for decorating leather should be noted (these are mostly of British origin). "Tree calf" is a marbled calf on which the pattern resembles the trunk and branches of a tree, and the earliest example comes from England around 1775. Tree calf has not been used extensively in the twentieth century, perhaps, in part, because the marbling process is a cause of deterioration of leather. "Etruscan calf" received its name from the resemblance to the "black figure" pottery of the Etruscans with

contrasting shades or colors of the decoration. Most of the Etruscan bindings have a classical urn in the center surrounded by Greek palmated leaves and outer borders reminiscent of Hellenic entablature. They were popular in the quarter of a century on either side of 1800. "Landscape bindings," used in the same period, show landscapes on the covers, generally freehand drawing with India ink or acid, or possibly stenciled or otherwise printed, also come from this period.

"Illuminated bindings" originated in France and were popular in the mid-nineteenth century. They show designs in both gold and colors. Another process for showing designs in color is the "Sutherland tooling process," patented in 1896 by G.T. Bagguley of Newcastle-under-Tyne, and while it achieves rather striking effects, it is too delicate to be handled and is generally restricted to doublures. It was used originally on books bound for the Duchess of Sutherland. Richard Cosway (ca. 1747–1821), the noted British miniaturist, lent his name to "Cosway bindings," leather bindings with miniature paintings inserted in their covers. Actually Cosway bindings were introduced only in the beginning of the present century by Rivière and Son. A talented Miss Currie copied the miniatures, but the bindings were designed by Mr. Stonehouse.

Binding materials other than leather offer special problems to the finisher. Vellum cannot be tooled in blind or in gold with much success. Silk, actually too fragile for a practical binding, may be tooled, but care must be taken not to stain the material with glaire or to scorch it with a hot tool. Velvet can be decorated only with large tools, since it has such a deep pile. When unusual or exotic materials are used (e.g., tapa cloth for a James Michener book, snake skin for a Raymond Ditmars book), decoration should be restricted to pasted-on spine labels, since the natural design lends the desired effect.

Lettering is a late development, for in the Middle Ages and even into the sixteenth century, most books were shelved on their backs. The fore-edge may have been lettered, or a piece of vellum inscribed with the author and title was glued on the back (the upper side when the book was shelved with the fore-edge to the wall). Late in the sixteenth century the increased size of libraries required that books be shelved upright to economize on space, and the more elaborate decoration of spines suggested that the books could also be decorative household furnishing. In the first half of the sixteenth century gold-tooled spine lettering came from Italy and soon thereafter from Paris, then spread to England and the Continent. Tooled lettering did not become common until the latter part of the seventeenth century. Lettering was done with large individual tools (sometimes resulting in curious abbreviations), but in the late eighteenth century the typeholder and lettering pallet began to be used. About the same time printed paper labels were used widely, but commercial binders abandoned them when gold blocking on cloth came into general use in the 1830s.

Restoration and preservation of bindings is an entire discipline in itself. Such official or quasi-official agencies as the Institute for Restoration and Preservation of the Akademiia Nauk in Leningrad or the Istituto de Patologia del Libro in Rome, private investigators such as W.J. Barrow of Richmond, Virginia., libraries such as the New York Public Library (John Archer and H.M. Lydenberg), organizations such as the Library Binding Institute, and many individual binders have conducted productive studies in this area. The definitive manual on preservation and restoration is still lacking. At this point it is sufficient to issue a few caveats: Never attempt homemade restoration with miscellaneous adhesives and adhesive tapes. Never use any binder or restorer who is not recommended by one of the major rare book libraries. In general, do not rebind or attempt restoration unless the book is subject to further deterioration in its present condition. If a noble book suggests the need of a noble binding, consider a chemise inserted into a tastefully decorated slip case, leaving the book in its original state.

At this point a word about slip cases (sometimes called “thumb cases”), Solander cases, and chemises is in order. These devices are far and away the best means of preservation, for they do no injury to the book as it has been handed down through the years, and they also protect it from further damage and offer an opportunity to the binder to pay homage to a fine volume. Meticulous care must be exercised in measurement for slip cases, and it is essential that they be constructed to permit easy removal of fragile books. They may be in full leather, half leather, paper (plain or decorated), cloth, or most any other material. Leather spines—but not others—may have imitation raised bands. Leather and half-leather slip cases may be tooled in the same way as a leather binding. The Solander case, named for its inventor, Dr. Daniel Charles Solander, Anglo-Swedish naturalist on the staff of the British Museum in the 1760s and 1770s, differs from the slip case in that books are inserted from one end, not from the fore-edge. It may be covered in the same manner as a slip case and decorated if covered in a suitable material. A chemise, or a protective cover, lined with muslin or some other soft material, should be fitted over any book worthy of a slip case or Solander case before the case is designed. Slip cases or Solander cases are useful for vellum bindings, susceptible to curling even under the most careful temperature and humidity control.

HISTORY OF HAND BINDING

The history of bookbinding as we know it begins with the Roman diptych, two facing receptacles for wax tablets, or *pugillares* connected at the back with rings. Diptychs were made of ebony, boxwood, ivory, or some other hard material, and the outside covers were sometimes elaborately carved. The text proper was incised with a stylus on the

wax surface. There were also triptychs, including three *pugillares*, and some containing even more.

The codex form of the book is associated with the rise of Christianity. More specifically, the Coptic bindings from early Christian communities in Egypt reveal most of the basic characteristics of the binding of codices, and possible future discoveries may tell us much more than we know at present about the genesis of binding practices. Only fragments of the earliest bindings used by the Coptic Church in Egypt survive, but they are sufficient to tell us a great deal about the origins of the binding of the codex. Surviving examples of Coptic binding, mainly from the ninth, tenth, and eleventh centuries and quite fragmentary, show the full heritage of Hellenistic ornament in blind tooling, *cuir ciselé*, and even rudimentary *pointillé*—the basic styles of the previous 1000 years, and the basic techniques of the next millennium.

Greek art as well as Greek science owes much to the Christian Syrians and Egyptians, who were tutors of the Moslem invaders of the seventeenth century. The sophisticated Coptic leathercraft was picked up at once by the Mohammedans and taken to Sicily and Spain along with other skills inherited from the orient (e.g., papermaking, marbling, gold tooling). The full story of Europe’s artistic and intellectual legacies from Islam is still imperfectly known; but when it is told, the provenance of the technology and the artistic traditions of Western European binding will be much better understood.

Western Christendom had a tradition that went back to late Roman antiquity. In Europe as well as Africa the codex book was a necessary development, but techniques and decorative traditions were different. There were leather bindings on boards in the early Middle Ages, but we have few examples before the eleventh century. The Stonyhurst Gospel of the seventh or eighth century, with rudimentary blind tooling on leather or birch boards, and the Victor Codex at Fulda are well-known examples of medieval binding in the conventional manner in Europe. A very small group of decorated Carolingian leather bindings has survived.

As early as the seventh century there is an example of a jeweled binding, the Gospel for the Empress Theodelinda in Monza. The jeweled binding, with gold filigree, pearls, carved ivory, and enamel was frequently produced from the ninth through the twelfth centuries for emperors and secular and ecclesiastical dignitaries, but more as an act of piety than as a display of artistic skill. Noteworthy examples are the Codex Aureus (presented to St. Emmeran by Emperor Arnulf in the ninth century; now in the Bayerische Staatsbibliothek) and the lectionary from the Bamberg Cathedral (a gift of Henry II, also in the Bayerische Staatsbibliothek).

More important are the romanesque bindings of the twelfth and thirteenth centuries, of which some 200 survive. The stamps represented biblical characters such as David, Samson, and the Virgin, as well as themes from

classical mythology, such as centaurs and mermaids. A characteristic of the romanesque bindings is successive rectangular borders around a central square, rectangle, or circle. Romanesque bindings were produced in Germany, England, and France. There were two especially important shops in Paris in the neighborhood of the Sorbonne between 1135 and 1146.

Blind tooling, not only with individual dies but also with rolls and panel stamps (see above) reached a high level of artistic achievement in the fifteenth and sixteenth centuries when Gothic styles prevailed. Several unusual features of bindings during this period should be noted. Signed bindings [e.g., by the noted binderpriest, Johannes Rychenbach (Richenbach), chaplain of Geislingen] began to appear. Lettered inscriptions, such as a *Laus Deo* or an *Ave Maria*, on bindings suggest the rapidly developing concept of typographic printing. During the Gothic period we have quite elaborate inscriptions, giving even the full name and status of the binder and the year and the date when the work was completed.

The single stamps used in the Gothic period have been analyzed in meticulous detail by Ernst Kyriss,^[2] and thanks to his labors, styles and trends of this period are better known than any other before the Renaissance. Two major types of arrangement of the stamps can be identified. One is characterized by compartmentalization of the surface of the binding by means of lines, with the small stamps arranged within the compartments. The other type showed a large central panel surrounded by smaller stamps arranged in a geometric design. The octavo book, which became quite common in the early period of typographic printing (in contrast to the quarto and folio volumes of the manuscript period) were especially well adapted to the use of panel stamps (of necessity, relatively small). A large proportion of Gothic bindings are of monastic or of some other type of clerical provenance.

The late period of the Italian Renaissance was the source of the seminal traditions of modern hand binding. The Venetians had intimate contact with the Levant, before and after the fall of Constantinople in 1453; and the Neapolitans had equal intimacy with the Moors of Spain and North Africa. Both traditions were related, and undoubtedly both had their effects in Italy, with interlacing, reticulation, narrow fillets, cable patterns, and tiny roundels, which characterized Italian bindings of the late fifteenth century. The introduction of gold tooling to Italy (see above) was a major step forward. The vigor and imagination of Aldus Manutius as a manufacturer of books, regardless of how much or how little he personally innovated, cannot be overemphasized. He and his successors used every idea that drifted into Italy with full effect. The relationship of typographic design and the finishing of bindings in the Aldine tradition is especially obvious in the Aristotle of 1495 and the famous *Hypnerotomachia* of 1499, in which knobs and borders in the bindings have a striking similarity to the decorations on initial letters in the text.

The styles, which we know from Venice, are inseparable from the bindings commissioned or collected by Jean Grolier de Servin (1479–1565), French diplomat and bur-sar in Italy and friend of Aldus Manutius. Most of his some 3000 books, many bound in an apogee of the early Venetian style, with exquisite gold-tooling, went to his son-in-law, Méry de Vic, Seigneur d’Erménouville, but they were later dispersed, and those authentic items with the inscription, *Io. Grolierii et amicorum*, are special treasures of any collector or library lucky enough to acquire them. Grolier was addressed by Geoffroy Tory as “amateur de bonnes lettres, & de tous personnages sauans,” and some of his *amici* are listed in a famous quatrain:

Vatibus, historicis, addit calcaria; cunctos
Scriptores fovet, his fertque patrocinium.
Musurus, Stephanus Niger, atque Thylesius, Aldus
Lascaris, Arpinus, sunt mihi firma fides.

A successor of Jean Grolier in Italy was Thomas Mahieu (Maiolus), for whom bindings similar to Grolier’s were executed. Some 90 are known and identified. The styles are quite similar to those of Grolier’s bindings, with the characteristic interlaced strapwork, with impeccable gold tooling. In the same stylistic tradition are the so-called “Canevari bindings,” once ascribed to the papal physician, Demetrio Canevari. Actually these bindings were most probably ordered for books presented by Cardinal Alexander Farnese (son of Pier Luigi Farnese, duke of Parma and secretary to Pope Paul III) for his nephew, Alexander Farnese, about 1545–1547 as a reference collection. Regardless of genealogical and political problems, the “Maioli” and “Canevari” bindings are superb examples of finishing techniques of the sixteenth century.

The heritage of Marc Lauwrin, or Laurin, Seigneur de Watervliet, cannot be overlooked. Classicist, antiquarian, and patrician of Bruges, he has left two or three examples of work in the Grolier–Mahieu–Canevari style. In the Louvre there is a binding inscribed “Io. Grolierus M. Laurino D.D.”^[3] “M. Lavrini et amicorum” appears on his few surviving bindings.

A method of decoration used in Italy in the sixteenth century was a sort of cameo binding. Relief impressions, like ancient cameos, were produced by stamping leather with dies cut in intaglio. A noble example may be found in the British Museum’s Grenville Library: Celsus, *De Medicina* (Venice, 1497), inscribed by Grolier: “Est mei Io. Grolier Lugd. & amicorum.” The workmanship on the cameos is almost flawless. One of the Canevari (*vice*, Farnese) bindings has a superb cameo of Apollo driving a chariot hitched to two horses toward a crag on which Pegasus is perched, the whole oval cameo being encircled by the inscription:

ΟΡΘΩΣ ΚΑΙ ΜΗ ΛΟΞΩΣ

It is likely that some of the important surviving Italian bindings of the sixteenth century were produced in Lyon as well as in Venice and possibly Rome, Milan, and Naples. Toward the end of that century Italian binding deteriorated, along with other aspects of Italian art.

In France the Guild of St. Jean Latran, under the protection of the University and settled in its precincts, had a strong influence on the production and sale of books, not only in the Quartier de l'Université, but also throughout Paris and the rest of France. The guild was founded with a membership "en grant nombreur, riches et oppulenz" but it conservatively followed traditional styles, the Gothic in the fifteenth and early sixteenth centuries, the Italianate in the sixteenth. It was dissolved along with other Parisian guilds on March 17, 1791, although its influence had been almost nonexistent for over a century.

The early gold-tooled bindings of France date from the second decade of the sixteenth century [e.g., Thomas Linacre's copy of his translation into Latin of Galen's *Methodus Medendi* (Paris, 1519) presented to Henry VIII].—By the time of Francis I the influence of Italian binding traditions becomes obvious in France. A singularly fine example of this tradition is the binding of the *Vulgata* (Paris, 1538–1540; plate I in Marius-Michel,^[4] *La reliure française*), of which the main centerpiece is Italianate, yet the main design is Gallic. A binder for Francis I was Pierre Roffet, le Faucheur, "reliieur du Roy." Perhaps the most famous binder, illustrator, and printer of this period was Geoffroy Tory (ca. 1480–1533), educated in Italy and strongly influenced by Italian traditions. Tory was probably not a finisher, but he undoubtedly drew designs both for his illustrations and his bindings. It is doubtful that any other stationer of Western Europe in the sixteenth and seventeenth centuries conceived and produced work of comparable quality.

The bindings executed for Henri II and Diane de Poitiers bring into sharp focus the peculiar characteristics of French bookbinding (and French art in general) of the mid-sixteenth century. The crowned 'H' and the cipher of two 'D's' interlaced with the 'H,' surrounded by carefully arranged interlaced borders, is a high point of Renaissance art. The subtle contrasts of curved and angular forms, the intricate designs of the borders with interlaced fillets, and the suggestive devices and ciphers (H + D) of the king and his noble mistress are precursors of the baroque. There is a sharp contrast with the relative simplicity of the Grolier bindings. The collection of Henri II is largely preserved in the Bibliothèque Nationale; but that of Diane (Duchess of Valentinois after Henry succeeded his father in 1547) was dispersed, and only some 30–odd have been identified (Bauchart).

At the turn of the century a remarkable but short-lived dynasty of binders began with Nicolas Éve. He was binder in ordinary to Henri III and used the "semi" (strewn style, e.g., his binding of the 1581 Horace, an armorial panel surrounded by a field of fleurs de lis). Clovis Éve, possibly

the nephew of Nicolas, worked for later noble patrons, above all Marguerite de Valois, Queen of Henri IV, in essentially the same style. His typical design consisted of a field broken by a series of ovals, with flowers and sprigs of oak or pomegranate in the middle (the so-called style "à la fanfare"). Generally there would be borders of palm branches. The front cover usually shows a shield with three fleurs de lis. The legend, *EXPLICATA NON ELUDET*, is on the lower cover [e.g., the *Caesar* (Paris, 1564) in the British Museum, c. 19. a. 15].

In the early seventeenth century a still unidentified compatriot of Cyrano, "Le Gascon," produced some exceptionally fine work, tooled with singular care, in geometrical designs. His "pointillé" style (tool forms in dotted outline) was characteristic of his work. Some have identified Le Gascon with Florimond Badier, but the evidence is not convincing. Badier's name appears first in 1630, and he was accepted as a master in the Guild of St. Jean Latran in 1645. Many of Badier's bindings survive in the Bibliothèque Nationale. Another seventeenth-century French binder whose name should be noted is Macé Ruette, to whom the invention of marbled paper is often incorrectly attributed. Some of the great collectors of the day for whom French craftsmen worked are Henri IV, Jacques-Auguste de Thou, Nicolas Claude Fabri de Peiresc, and Sir Kenelm Digby.

The great French tradition of binding established in the Renaissance has endured to the present time, and even today Paris is still the world's most important center of fine binding. Only a few of the more important figures may be mentioned. Luc-Antoine Boyet (or Boyer), active from about 1680 until his death in 1733, used handsome dentelle borders (small contiguous stamps at the edge of the book cover, forming a lacy pattern) and may have introduced the decorated leather doublure (see below). His special patrons were the Marquise de Chamillart and Count Hoym. His son, Étienne, was binder and librarian of Prince Eugene in Vienna and also worked for Baron von Hohendorff. Probably a pupil of the Boyets was Augustin Duseuil, also a devotee of dentelle and doublure, but he was especially noted for his corner ornaments. Jean Charles Henri Lemonnier (d. 1782), binder for the Duke of Orléans, created some finely executed inlays in the style of *chinoiseries*. Antoine Michel Padeloup ("le jeune," 1685–1758) bound for Louis XV and the kings of Portugal. He used dentelle borders and inlay but also elaborate tooling such as feeding birds, not always in the best of taste, but technically well-nigh perfect. Mme. Pompadour was one of his best customers. Nicolas-Denis Derome ("le jeune," 1731–1788) was perhaps the greatest master of the *relieuse à dentelle*. His bindings are often identified by a small bird, but this method should be used with greatest care, since Derome le jeune and Dubisson also used a bird tool. Both Padeloup and Derome were members of families whose other members won distinction as finishers.

During the Romantic period Joseph Thouvenin (1790–1834), a student of the brothers Bozérien (binders for Napoleon, among others), was the best-known artist of the period. His technique was almost flawless, his ideas about decoration sensitive and pertinent to content. He was the master of the “cathedral” style, which used Gothic architectural motifs for cover decoration. G. Trautz, a German, married the daughter of the binder Antoine Bauzonnet (“master of the fillet” or “the Boyet of the nineteenth century”). He continued the historical trends of the Thouvenin school, and he produced singularly handsome bindings (often hard to open) for such noted collectors of the period as Baron Rothschild. They are signed Trautz–Bauzonnet. Toward the latter part of the century and into our own time we have such personalities as Chambolle, Duru, Cuzin, Gruel, Lortic, and Mercier, but they exhibited greater skill as forwarders than as finishers. There are signs of a renaissance of decorated bindings in France, and another Le Gascon, Padeloup, or Derome may well be serving apprenticeship today in some Parisian atelier.

After the great age of the Grolier and Mahieu binders, Italian binding suffered an eclipse from which it has never fully emerged. Italian binding of the seventeenth and later centuries has been strongly influenced by the French and, in general, has shown little originality. However, there are some young binders in Rome and Florence who are showing much promise.

Spain has always been a deviant country as a result of the Moorish domination, and her binding traditions reflect this situation. Arabic influence is revealed in the predominance of interlacing strapwork, rings, and dots, with a few supplementing stamps (some Islamic, some Christian in theme). The “mudéjar” style of medieval Spain has many imaginative features that represent a significant period of art history. Just as in Italy, Spanish binding styles from the *siglo de oro* on have been strongly influenced by the French. In Ibero-America there have been some outstanding shops in the twentieth century in São Paulo, Buenos Aires, Santiago de Chile, and Mexico City, mainly staffed by binders trained in Germany and France.

After the Gothic period at least one truly distinguished binder emerged in the Germanies, Jakob Krause (1531–1586). For the last twenty years of his life he was court binder in Dresden and created handsomely designed bindings in pigskin with decorated rolls and panels impressed in blind, a few gilded vellum bindings (a difficult art in every respect), and monumental decorated bindings on calf, the latter influenced by French and Venetian styles. His stamps (many cut in Augsburg, where he worked for a lustrum before settling in Dresden) were designed with fantasy and imagination, cut with flawless technology. Among his apprentices were Daniel Wachslar, Gregor Schenk the Younger, Urban Köblitz, Hans Hermann, and, perhaps the most competent, certainly the most famous, Caspar Meuser (d. 1593), successor of Krause as Saxon court binder. The latter’s son, Moritz, used tools in the

family stock for bindings for the Saxon archives. In April 1945 an air raid by the U.S. Air Force on Dresden destroyed a large proportion of the Krause bindings in the Japanisches Palais (home of the Königliche Sächsische Landesbibliothek).

It would be an error of omission not to mention Peter Flötner (ca. 1485–1546) of Ansbach and Nuremberg, whose remarkable wood-engravings are known from many sixteenth-century sources (e.g., *Spruchgedichte* of Hans Sachs). In addition to his contributions as an illustrator, he made plaquettes for German cameo bindings, not of the quality of those of the Italian school, but of considerable merit from the standpoint of imaginative design. In addition to Augsburg, Munich and Vienna were also major centers of the binding craft, for the kings and emperors were zealous to assemble libraries bound in the best contemporary styles.

In the seventeenth century there were remarkable naturalistic flower stamps (Praque, Gotha, Augsburg) and dentelle borders (Heidelberg). Far too little is known of eighteenth-century German bindings, and we need more detailed investigations of bindings for Frederick the Great (Kraft and Roch) and Goethe (Lehmann in Berlin). In the nineteenth century some of the ablest German binders emigrated, e.g., Trautz and Bradel to Paris, Zahn to the United States, Zaehnsdorf to London.

In the twentieth century German hand binding has attained new distinction. Best known abroad, perhaps, is Ignatz Wiemeler, whose stern insistence on the essentials of individual craftsmanship and basic elements of design is reflected in the work of numerous students. Otto Dorfner, theorist, teacher, and creative binder, has had a similar influence; and Paul Adam^[5] and Joseph Hoffmann belong in the same category as teachers and original artists. Fritz Helmuth Ehmcke (1978–1965), formerly professor in the Hochschule für bildende Künste in Munich, has had a strong influence on all aspects of German book arts. With F.W. Kleukens and G. Belwe he founded the Steglitzer Werkstatt. He has designed bindings, decorated papers and many typefaces in wide use. Franz Weisse (1878–1952), whose most productive years were spent as professor in the Kunstgewerkeschule in Elberfeld, was dedicated to the ideals of absolute simplicity in design. His relatively few bindings are among the best done in twentieth century Germany, but his influence in continental Europe is abiding. His home and his shop and most of his best work were destroyed one night in 1943 by an unprogrammed aerial raid. Despite the temporary setback of the period 1932–1945, hand binding and other arts, which advanced so rapidly in the Germanies from about 1890, are now on the rebound.

English binding reached no special distinction before the eighteenth century, although there are high points. The Gothic binding traditions of the Continent crossed the channel, and many engraved fillets and stamps comparable or similar to those in use in the Germanies and the Low

Countries reappeared in England. Few pictorial panels were used, but heraldic devices appear frequently.

In the latter part of the sixteenth century, England had such distinguished collectors as Lord Lumley, the Earl of Arundel, the Earl of Leicester, and Archbishop Cranmer, and the tradition has been continued to the present day. Many employed the best domestic and continental binders, and some of their collectanea have been preserved in the British Museum and a few other great English libraries. Such collections in the British Museum as the Harleian or that of the Rev. Mr. C.M. Crachecode, both intimately associated with the binding traditions of their period, explain in part the wealth of the museum in historical hand bindings.

Gold tooling is believed to have come to England in the work of Thomas Berthelet, or Bartlet, about 1540, a full half-century after gold tooling was used on the Continent. Berthelet showed some imagination, but the Italian influence is obvious in all of his work. Berthelet was also a printer, succeeding Richard Pynson in 1530 as royal printer. In Europe, England, and the Americas there was an intimate connection between the printing and the binding trades, and both were practiced in many of the major printing houses. The book business was monolithic in the sixteenth and seventeenth centuries: all processes, from type founding through retailing of the final product, were often done by one firm.

An Elizabethan collector often compared with Jean Grolier is Thomas Wotton, whose bindings are inscribed, "Thomae Wottoni et amicorum." His books were bound either in France, or by French craftsmen imported to England. Some of the work executed for Wotton is decorated only by a central armorial design, but others have considerably more elaborate devices, often decorated with strapwork resembling the designs of Grolier's binders. Through the Civil War and the Commonwealth, English binding, like English art (save literature) in general, was undistinguished. Samuel Mearne (d. 1683), binder for Charles II, and his son, Charles, produced rich and elaborately ornamented bindings, largely based on French models, but marred by heavy hands of relatively unskilled finishers. The Mearnes themselves were probably administrators of a book production firm, not binders.

In the eighteenth century English hand binding came into its own. There was James Edwards of Halifax, who invented transparent vellum bindings; John Whitaker, master of the Etruscan binding; and, above all, that eccentric genius, Roger Payne. Payne's remarkable tooling with delicate small dies, his almost unbelievable precision, and his exact gilding may have been partially inspired by indulgence in the Bacchic tradition. He inscribed his handsome binding for Barry's *Wines of the Ancients* with an amusing bit of doggerel:

Falernian gave Horace, Vergil fire,
And barley-wine my British muse inspire.

Payne designed and cut his own tools and did most of his own work, assisted by his brother, Thomas, and later by a partner named Weir. He bound for a few distinguished collectors, notably Rev. Cracherode, Lord Spencer, and Hon. Thomas Grenville (Lord Spencer's collections being largely preserved in the John Rylands Library in Manchester, the Cracherode and Grenville in the British Museum). Payne's use of straight-grain morocco (perhaps the first example among English binders and his "diced" russia ["diced" by ruling the leather in diagonal lines]) are characteristic features of his work. His meticulous tooling, much in pointillé, has never been excelled. He used heraldic devices as center panels on order from customers.

English and North American binding of the mid-nineteenth century and later is artistically unimportant, but much solid work was done by Francis Bedford (1799–1883) and his associates, Charles Lewis and John Clarke. They produced flawless forwarding, but their finishing was a weak imitation of Renaissance styles. Robert Rivière (1802–1882), scion of a family of French artists, taught himself binding and settled in London in 1840, where he bound for the royal family, the Duke of Devonshire, and other collectors, and restored the Domesday Book. His nephew, P. Calkin (Rivière and Son since 1880), carried on the business and did much solid but highly conservative work for British collectors. Joseph Zaehnsdorf (1816–1886) learned binding in Stuttgart and Vienna and settled in London in 1842. He attracted a substantial following among English collectors, and the reputation was maintained by his son, Joseph William (1853–1930), who continued a tradition of dignified but stolid finishing. He was court binder for Edward VII and George V. Francis Sangorski (1875–1912) and George Sutcliffe (1878–1943) formed a firm in 1901 in a Bloomsbury attic and have produced some usual inlaid and jeweled bindings (see above) along with much basic routine work with simple decorations. The Sangorski and Sutcliffe bindings of the *Rubāiyāt* of Omar Khayyām with the peacock design are particularly well known.

Thomas James Cobden-Sanderson (1840–1922), unhappy at the bar, took seriously the suggestion of Mrs. William Morris that he go into bookbinding, and he learned the rudiments of the craft in the shop of Roger de Coverly. Cobden-Sanderson shared the belief of William Morris that his age was one of pointless imitation, however skillful, of older styles (e.g., by Bedford, Rivière, and Zaehnsdorf). Imaginative and inventive, he did much to establish the concept of the innate quality of individual craftsmanship in contrast with mass production. While Cobden-Sanderson was certainly mistaken in many of his ideas about modern industrial tyranny, he did contribute a great deal to the craft by insisting on sound workmanship, the use of good materials, and originality in design. An apprentice at Cobden-Sanderson's Doves Bindery, Douglas Cockerell (1870–1945), put many of his master's ideals into practice, but Cockerell showed a vast fund of

common sense which was almost a closed book to Cobden-Sanderson.

In the United States, English traditions of hand binding have always been the major influence. When the Club Bindery (see Figs. 1, 2, and 3) was flourishing in New York around the turn of the century, both English and French craftsmen were on the staff. Some of the best binding in America has been done at the great printing houses which maintain extra-binding departments (e.g., The Cuneo Press with George Baer, or R.R. Donnelley and Sons with Harold Tribolet) and at certain libraries which maintain hand binders [e.g., Margaret Duprez Lahey at the Pierpont Morgan Library, Ferdinand Zach at Catholic University (see Fig. 4)]. German emigré binders, who have come to both hemispheres of the Americas since the 1930s, have also made a substantial contribution to the craft in the New World.

The medieval binding styles in the Low Countries were close to those of the Germans. In the seventeenth century one Magnus of Amsterdam was an exceptionally successful imitator of Le Gascon. John B. Smits of Haarlem and S.H. de Roos of Amsterdam executed some unusual designs around the turn of the century, and there are a number of promising young binders in Holland today. Among modern Belgian binders, René Laurent deserves special mention for the originality of his designs.

In Scandinavia styles were largely imitative up to the end of the nineteenth century, although there were occasional examples of superior workmanship and design, especially in Copenhagen. Hans Christian Lerche (1807–1876) was the founder of a Copenhagen hand-binding establishment, which his sons sold as late as 1921. D.L. Clément (d. 1877) catered to commercial publishers by using English cloth bindings, and when Immanuel Petersen (1836–1903), an accomplished gilder, took over his shop, both hand bindings of considerable originality in finishing and machine bindings were produced. Anker Kyser (1864–1939) started in Petersen's shop as a young gilder and developed rapidly in technical and professional skills. For most of the first part of the present century Kyser was the main personality in Danish bookbinding, skilled in forwarding technique and finishing, learned in the history of binding. His younger collaborators were Joakim Skovgaard, Hans Tegner, Johan Rohde, and, above all, Thorvald Bindsbøll. Around 1950 Henrik Park, a skilled and talented designer, became the heir to the Kyser establishment. Danish bookbinding in the twentieth century would have had a totally different tradition if August Sandgren (1893–1934) had not had a little shop in which he devoted all his energies to the ideal of individual craftsmanship, much in the tradition of Cobden-Sanderson and Marius Michel. His work is basically simple in

Fig. 1 From the Club Bindery.

Fig. 2 "Salome," by Oscar Wilde, bound for Willis Vickery at Rowfant Bindery. Designed by Henri Hardy, and finished by Gaston Pilon. Cf. *Progressive Printer*, 19, 357 (1909).

Fig. 3 Anacreontis Teii Odae (Paris, Henricus Stephanus, 1554) (Club Bindery, 1898).

construction and design, but it represents the highest standards of personal achievement. His marbled papers and lithographic papers (with Axel Salgo) are exemplary.

In Sweden most bindings before 1850 were imitations of French, and, to some extent, of English and German styles. Johan Frederick Stangenberg, who flourished between 1821 and 1841, produced simple tooled bindings on long-grain leathers. After about 1850 there were a good many solid orthodox bindings by Gustaf Hedberg (also a historian of binding). During the 1920s and 1930s Akke Kumlien, master of most of the book arts, designed some publishers' bindings for P.A. Norstedt and söner, which have had an enduring influence in the Scandinavian book-making tradition. Two lady binders, Countess Eva Sparre and Greta Morssing, have produced work that is a major contribution to Swedish binding tradition.

The leading Norwegian bookbinder of modern times is M.M. Refsum, who established his firm in 1887. He worked closely with many outstanding Norwegian artists, notably Gerhard Munthe and his own son, Tor Refsum.

During the 1950s significant traveling exhibits of English, West German, Swedish, and Danish hand bookbindings were sponsored by the University of Kentucky Libraries. The viability of artistic inspiration in all four

Fig. 4 Binding of an edition of the Council of Trent, edited by Dr. S. Kuttner of Catholic University in 1942. The original manuscript is in the Pierpont Morgan Library Binding by Dr. Ferdinand Zach and presented by Catholic University to the Pope.

shows attracted considerable attention, and there is every reason to believe that some of the best book design and bookbinding will come from countries north of the Scheldt in the second half of the twentieth century.

CONCLUSION

Serious scholarship in the field of the history of bookbinding is largely a labor of love, and foundation support is rarely forthcoming. Nevertheless, scholars such as the late G.D. Hobson,^[6] Prosper Verheyden, Luc Indestege, Ernst Kyriss, and Ilse Schunke^[7] have made substantial contributions to the history of the book and to Western European cultural history with their investigations. The history of hand binding offers many opportunities for the bibliographer that have not been fully appreciated.

GLOSSARY

- Antique binding.** See Divinity binding.
Armenian bole. See Bole.

Basil.	Sheepskin, generally poorly tanned, used for inexpensive bindings.	Chevrotain.	Leather made from the skin of small guinea deer; also called cheveril.
Beating stone.	A stone set in a pan filled with sand, on which books are beaten to make the paper more compact.	Cloisonné.	Enamel intarsia between strips of metal placed on a porcelain or metal base.
Blind tooling.	Impression of tools on leather by hand, to form an engraved design, not to be painted or covered with gold leaf.	Cosway bindings.	Leather bindings with miniature paintings inserted in their covers; named for Richard Cosway (1742–1821), the English miniaturist, but who had nothing to do with the development of this style (an early twentieth-century fad).
Bole.	A reddish mineral (friable clay) similar to chalk used to prepare edges for gilding; also known as Armenian bole.	Cottage style.	Decoration associated with the Mearnes, characterized by the outline of a cottage gable on the cover.
Butter stamp.	Stamp applied to the whole spine of a book, decorating it with a single impression; generally cut for collected works of single authors and used widely by nineteenth-century edition binders.	Cropped.	A bound book, of which the edges have been trimmed radically, sometimes even cutting into the text, is said to be cropped.
Cameo binding.	A binding decorated with stamps cut intaglio (similar to a seal) and impressed on the center of the book as a medallion; background is generally painted in gold or colors; see also Plaque binding.	Cuirbouilli.	A design in relief on a leather cover, formed by modeling and hammering.
Cancel.	A corrected leaf, tipped in on the stub left from an incorrectly printed leaf which has been removed.	Cuir ciselé.	Decoration by incising the design into the leather; also known as <i>Lederschnitt</i> or incised leather.
Canevari binding.	Binding allegedly in the library of Demetrio Canevari (1539–1625), an Italian physician and collector of the sixteenth and early seventeenth century, whose books were probably those commissioned for binding by Cardinal Alexander Farnese for his nephew, Alexander Farnese, Duke of Parma, between 1545 and 1546; see also Farnese bindings.	Cumdach.	A box for a book in the shape of a casket, used in Ireland up into the eleventh century.
Case.	Simple cover of book, not yet covered with cloth or leather.	Cusped-edged stamp.	A stamp used in the south Germanies to provide the effect of a leaf design.
Catch stitch.	A stitch which fastens one section of a book to the other, also called chain stitch or kettle stitch.	Cut in boards.	A book whose edges are cut after the boards are laced on is said to be cut in boards.
Catenati.	Chained books.	Deckle edge.	Rough edge left on a sheet of paper in the manufacturing process.
Cathedral style.	The early nineteenth-century style which employed Gothic architectural motifs for decoration of covers.	Dentelle borders.	Small contiguous forms at the edge of a book cover (or doublure), forming a lacy pattern with ends pointing toward the center of the cover.
Chain stitch.	See Catch stitch.	Diaper design.	Repetition of lozenge forms at formal intervals.
Champlevé.	Embedding enamel in canals in metal plates used for book covers.	Diced.	Ruled leather, usually in crisscrossing diagonal lines to form diamonds.
Chemise.	Cover or jacket used to protect a binding, usually inserted in a slip case or a Solander case.	Diptych.	A Roman device for letter writing, consisting of two facing wooden tablets (or tablets of metal or ivory), of which the inner surfaces are covered with wax to be incised by a stylus.
Cheveril.	See Chevrotain.	Divinity binding.	Books covered in thick bevelled boards with Oxford corners, often with a heavily rounded spine and with Dutch marbled end papers; popular in the period from 1840 through 1870 in England; also known as ecclesiastical or monastic bindings.

Doublure.	Lining of leather, silk, or other material instead of customary end sheets; leather doublures are often decorated.	Forwarding.	Sewing and covering a book.
Ducali bindings.	Bindings for collections of official documents of the Venetian doges, often showing both occidental and oriental techniques in a single pattern.	French chalk.	A soft chalk used to remove grease spots.
Dutch flowered.	See Dutch gilt.	French shell.	Marbled papers with a conchological pattern popular in late eighteenth-century France.
Dutch gilt.	Papers decorated with wooden or metal blocks, or produced by engraved rolls; first produced in Germany and Italy, then imported into the Low Countries and exported from there to France and England (hence "Dutch").	Full-gilt.	An adjective applied to books of which all the edges are gilded.
Ecclesiastical bindings.	See Divinity bindings.	Gauffering.	Decorating a book edge with a tool over the gilt edge, often with elaborate designs.
End papers.	Sheets not forming part of the text pasted down inside of front and back covers; often decorated, sometimes illustrated (e.g., with maps or thematic illustrations in commercial books).	Girdle book.	A book whose binding had an extra protective cover, elongated so that one end could be attached to a belt or a girdle; common in Western Europe and Ethiopia; frequently used by wandering missionaries.
Etruscan bindings.	Decorated light brown or terra cotta covers with designs similar to the "black figure" pottery of the Etruscans.	Glaire.	White of egg, plus vinegar, water, and occasionally other substances, used to size tooled impressions on a leather cover (or, sometimes, cover of other material) or a smooth edge of a book, before gilding.
Extra binder.	A hand binder who uses the best manual techniques and the highest quality of material to satisfy orders for special work.	Gothic binding.	A style of decoration widely used in Western Europe in the fifteenth and sixteenth centuries, characterized by numerous stamps and rolls in blind.
Fanfare.	A cover design broken into a series of geometrically arranged ovals, bounded by fillets, and elaborately decorated with flowers, sprigs of oak, or pomegranates.	Grooved boards.	Boards cut out to receive slips of a book, or cover boards with grooved edges (characteristic of Greek bindings).
Farnese bindings.	Bindings with polychrome oval plaquettes, of which some 105 survive, originally the property of the papal physician Demetrio Canevari, or of Pier Luigi Canevari; see also Canevari bindings.	Guard.	A narrow strip of paper, used to repair a damaged fold, or to attach a plate or a single leaf.
Fillet.	A round finishing tool which makes an impression as it is rolled on a cover to form a running line or a series of designs on a book cover; also called a roll or a roulette.	Harleian style.	An English style of the eighteenth century, with a center of small dies in a lozenge form and a border decorated with a roulette; characteristic of the bindings of the Lords Harley, now mainly in the British Museum.
Finishing.	Decoration of a book after the boards have been covered.	Headband.	A band across the top edges of the book block, usually of silk, linen, or cotton (often in motley colors), and fitted to the contour of the back of the spine; see Tailband.
Fly-leaves.	All the leaves of an end-paper section.	Hollow backs.	Deceptively hollow construction affixed to the back of a book block before it is covered.
Fore-edge painting.	A painting on the fore-edge of a book visible only when the edge of the book is fanned out; generally covered by gold leaf when the book is solid (or not fanned out).	Imprint.	Place of publication, publisher or printer, and date; on last leaf of early printed books, in sixteenth century and thereafter generally on title-page.
		Incised leather.	See Cuir ciselé.
		Inlay.	Insertion of pieces of colored leather or other materials into incised patterns

	on a leather cover; often called intarsia; sometimes actually onlay, since pieces of colored leather are applied to blind-stamped patterns.	Onlay.	Pieces of colored leather or other material affixed over an outlined tool form, border, or panel; see also Inlay.
Intarsia.	See Inlay.	Overcasting.	A sewing process in which all the leaves of a section are bound together with thread.
Jansenist bindings.	French bindings of the second half of the seventeenth century, named for the highly orthodox Jansenists, and characterized by decorations only with blind-tooled lines.	Oversewing.	See Overcasting.
		Panel stamp.	A large stamp frequently pictorial, stamped in the middle of a cover of a book; common decoration of Gothic bindings.
Kettle-stitch.	See Catch stitch.	Plaquette binding.	Binding with medallions in the center of the cover as the main decoration; see also Cameo binding.
Knocking-up.	The process of squaring and making compact the back of the sections of a book.	Plough.	A wooden device into which a cutting edge is fitted to cut edges of a book in a lying press.
Kutch.	A container for a heavy piece of gold while it is being formed or beaten into thin pieces.	Pointillé.	Decoration of covers by tool forms in dotted outline (<i>fers pointillés</i>); used in seventeenth-century France by Le Gascon and his contemporaries.
Laid paper.	Paper manufactured in a mold in which heavy lines of wire are attached to the bottom, usually to form a pattern.	Polaire.	Book satchel used in medieval Ireland.
Landscape bindings.	Covers decorated with a watercolor of a landscape, frequent in England in the 1820s.	Pounce.	Adhesive used under gold or colors to make them stick firmly to the surface which they decorate.
Lederschnitt.	See Cuir ciselé.	Polyptych.	Three or more wooden tablets used for letter writing, with inner surfaces covered with wax to be incised by stylus; see Diptych.
Lozenge.	A tooled form in the shape of a diamond, or a square figure placed from one of its points; often gilded.	Provenance.	Record of previous ownership.
Lyonnais bindings.	Bindings of the sixteenth century with interlaced strapwork, often painted and with large cover ornaments, with a background filled in with dots; other French and Italian bindings from different localities show the same characteristic decoration.	Pugillares.	Tablets whitened to receive ink, or covered with wax to be engraved with a <i>stilus</i> ; also called <i>tabellae</i> ; Ovid, Am. i. 12, I.
Marbling.	A process by which oil colors are floated on size to form a design, then transferred to leather, paper, other covering material, or book-edges.	Pull.	To separate quires of a book from old cords and tapes and to remove the old glue.
Mosaic.	Inlaid designs on book covers; also called Intarsia or Inlay.	Raised bands.	Cords on the spine of a book over which the threads are passed.
Monastic bindings.	See Divinity bindings; also applied to any binding executed in a monastery.	Roan.	Sheepskin tanned in sumac.
Morocco.	Goatskins originally imported from Morocco, now mainly "Cape goat" (from South Africa), Niger (see <i>below</i>), and Turkish goatskin.	Roll.	See fillet.
Mudéjar style.	Strapwork design on a cover by medieval Spanish Moslem craftsmen who worked in Christian jurisdictions.	Romanesque bindings.	Bindings of the twelfth and thirteenth centuries richly decorated with single stamps, produced in England, Germany, and France.
Niger.	A "morocco" leather from the skin of small goats found in Nigeria and the Mediterranean coast of Africa.	Rough gilding.	Gilding of edges before a book is sewn.
Nonato bindings.	Covers in the skin of a foetus of a stillborn Argentine pampas calf, with the hair left on (<i>nonato</i> = not born).	Roulette.	See Fillet.
		Roundel.	A stamp forming a double ring, usually with a dot in the center.
		Russia.	Calf or cowhide originally imported from Russia, tanned with willow bark, dyed with sandalwood, and soaked in birch oil.

Saddle.	Part of book-sewing machine on which quires are placed so that folds may be directly below sewing needles and loopers.
Sawn-in.	The spine of a book is sawn in to provide a canal into which cords may be placed.
Semis (semée).	A cover design in which small stamps are located at regular intervals to form a design; originally a heraldic term.
Serefsan.	Gold-flecked paper from Persia or Turkey.
Slip case.	Book container opening at the front edge.
Solander case.	Book container opening at the top, so-called after Daniel Solander, a librarian in the British Museum, 1765–1782.
Spring backs.	Backs capable of retaining a firm position.
Sprinkled calf.	Speckled surfaces on calfskin produced by sprinkling of acid.
Sprinkled edge.	An edge sprinkled with gold, red ink, or other colors.
Stabbing.	Method of sewing books by which the inner edge of the entire book-block is perforated.
Stamp.	A tool-engraved intaglio to be impressed on a leather binding; impressed unheated in medieval and early modern times; today, impressed heated with an arming or blocking press.
Strapwork.	Interlaced double lines forming a geometrical pattern; a special characteristic of Grolier bindings.
Super-exlibris.	Panel stamp in center of front cover to indicate ownership.
Supralibros.	See Super-exlibris.
Sutherland tooling process.	A method of tooling in color on different materials used around 1900; name is from books bound for the Duchess of Sutherland by G.T. Bagguley of Newcastle-under-Tyne.
Tabellae.	See <i>Pugillares</i> .
Tailband.	A band on the tail edge of a book (opposite the head) usually of silk, linen, or cotton, and fitted to the contour of the book; see Headband.
Tree-calf.	Marbled calfskin with the pattern of the trunk and branches of a tree.
Triptych.	Hinged metal tables like the diptych, but with three tables instead of two.
Two-sheets-on sewing.	A method of sewing in which each length of thread holds two sections instead of one.

Vellum.	Thin scraped calfskin prepared with lime, not tanned.
Wire marks.	Marks left in a piece of paper by the wires in the bottom of the mold.

Biological Information and Its Users

Kalpana Shankar

School of Informatics, Indiana University, Bloomington, Indiana, U.S.A.

Abstract

The purpose of this entry is to introduce the information science reader to the wide range of data and other resources that constitute “biological information.” Attention is paid to both paper and digital sources and the use of digital libraries and cyberinfrastructure for the creation, use, and reuse of information. The entry discusses various user communities and their needs, including scientists, educators and students, policy makers, and other secondary users. The entry concludes with challenges for data sharing, preservation, and access.

INTRODUCTION

The term “biological information” covers an enormous range of content, format, and uses. The creators and users of it are just as heterogeneous. The range of disciplines encompassed within the term “biology” is itself broad, including descriptive fields that rely on fieldwork and observation to those that are exclusively computer-based, or computationally intensive. Not surprisingly, the data generated from the results of scientific activity within these fields (which is what most biologists would call “biological information”) generates a variety of information formats and storage, from paper-based laboratory notebooks and anatomical drawings to petabytes of numeric data generated from high throughput screening, sensors, genomics, and proteomics. There is also a great deal of information generated by what might be termed the context of scientific practice. Information that can provide insight into the processes that generated scientific data may include grant reports, patent applications, correspondence, personnel records, and other texts and data that are not necessarily direct products of research practices. This does not even include medical information, which comes with a different and attendant set of users, privacy and other concerns, and legal ramifications. This encyclopedia piece, however, will focus on the realm of data products from the scientific research process and on contextualizing information from the conduct and organization of science within institutions.

For the information scientist, biological information presents fascinating challenges for understanding and facilitating information policy, organization, sharing, and access. This entry will first discuss some data-intensive current practices in biological research. Next, it will describe some of the variety of information that encompasses “biological information,” focusing on both the data products of scientific activity (this includes results of

experiments and analysis) and the documents that are created in the context of scientific research (correspondence, grant applications, and similar materials). Following that, the categories of users—scientists, educators, policy makers, and activists, will be discussed. Lastly, the entry will outline some challenges that exist for understanding biological information and its uses—highly collaborative environments, data-sharing and intellectual property regimes, proprietary formats. The conclusion will discuss potential challenges for information studies research and practice.

INFORMATION PRACTICES ACROSS THE BIOLOGICAL SCIENCES

The pedagogy of research in the biological sciences has been compared to an artisanal model.^[1] In universities around the world, junior students of the biological sciences trained with more senior scientists, then set up laboratories in other academic, independent, and government scientific institutions, often introduced through networks to their future employers. While scientists used various instruments, the primary mechanism for recording information was the laboratory notebook which contained drawings, handwritten notes, and served as a daily aide-memoire for the scientist. To some extent, this model of research training and scientific data gathering persists and continues to be taught in the science classroom, although many digital tools exist for capturing and storing data.

However, the biological sciences underwent radical changes in the latter half of the twentieth century and continue to change. The widespread use of information and communication technologies (ICTs) has made the biological sciences (indeed, all sciences) globalized and highly data intensive in nature. As a result, one emergent trend that has influenced the nature of biological

information is the advent of research teams can span countries and continents as expensive equipment is shared remotely and data sets analyzed in parallel. There have been efforts in numerous countries to develop information infrastructures that centralize data sharing and collection, standardize descriptive data (metadata), and make the use of remote tools more readily available. The emergent sciences of genomics (the study of genes), proteomics (the study of proteins), and chemical informatics (the study of molecular and submolecular entities in living systems) belong to this data-intensive category of science. Sensor-based biological arrays, from the particulate level to terrestrial grids, are producing terabytes of data on a daily basis. Examples include microorganism analysis,^[2] climate change, and land use.^[3] Systems such as the proposed Global Earth Observation System of Systems (GEOSS) integrates other information infrastructures to provide multidisciplinary perspectives on biological problems that are planetary in scale and scope of data.^[4]

A second important trend in the biological sciences that has been responsible for the generation of most of the data (and related and derivative information products) is the increase in the quantity and size of collaboration, often in response to emerging problems or even crisis situations (such as the SARS epidemic). Many researchers have noted that the need to gain access to instruments, unique data, and funding for increasingly complex projects requires the assemblage of individuals and teams with diverse skills.^[5] As many scientists become more and more highly specialized, these teams are necessary to solve complex problems. Teams can also minimize impact on politically, environmentally, and socially sensitive regions and areas. Governmental funding agencies such as the United States National Science Foundation (NSF) and funding programs in the European Union often require that collaborations be formed in order to use natural and data resources in efficient ways. Collaborations also cut across geographical and institutional boundaries. Non-profits, academic, government laboratories, and industries can work together to mobilize around problems and issues of mutual interest, hopefully with benefit to all concerned parties.

A third trend that has been instrumental in generating the explosion of biological data is the increasingly data-intensive nature of the biological sciences, aided by the introduction of information technologies with the capability to generate, manipulate, and store vast quantities of data at a high rate. Benoit^[6] notes that the collaboration of computer scientists and molecular biologists has generated an impressive collection of tools to manage data, conduct analyses, and present results that would not be possible without the integration of these disciplines. While the term bioinformatics has been reserved for the application of information technology, data mining, visualization, and other computational tools to questions in molecular biology, the other biological sciences (i.e., those whose

research purviews reside above the level of molecule, from the cell to whole systems) have also been aided by “informatics” and in turn have generated vast quantities of data. The resulting data (often the results of extremely intensive string manipulations^[6]) is stored in databases that may be local, publicly available, or commercial/proprietary.

The contribution of high performance computing to the scientific enterprise has been subsumed under the term “cyberinfrastructure” coined by the NSF to coordinate and further its sponsored research efforts in data acquisition, storage, management, and other Internet-based services around scientific information.^[7] In the United Kingdom and the rest of Europe, similar efforts are usually called e-Science.^[4] The term is meant to include the human resources needed to make the technical infrastructure function, but the discourse has tended to focus on a technologically deterministic vision for Web services in science.^[7,8] Cyberinfrastructure grants have proven to be technological drivers in furthering the computationally intensive sciences. Challenges include making data formats mutually intelligible, the creation and implementation of standards, and the creation of tools that make data resources potentially useful to multiple communities of experts and nonexperts. An important commonality across these cyberinfrastructure projects is the need for efficient storage and access to information.^[9] Many in the biological communities have relied on cyberinfrastructure projects to minimize bottlenecks to data sharing, since data derived in NSF-funded projects are generally considered open access and nonproprietary. Nevertheless, because cyberinfrastructure is built upon the current Internet, it has inherited all of the technical, legal, cultural, and policy problems of the Internet, including security, language barriers, intellectual property regimes, and others. However, cyberinfrastructure is not the only mechanism by which the biological sciences have been transformed. Traditional biological fields, such as anatomy, animal biology, and taxonomy, have also undergone dramatic changes, aided by the use of various kinds of technologies. Mapping technologies such as Geographical Information Systems (GIS), satellite imagery, and earth-based sensor networks allow scientists to use data that has changed the nature of these “traditional” biological disciplines.^[10,11] The ability to analyze legacy and archival data sets with new tools can yield insights into new problems. For example, analysis of tissue samples and doctors’ notes from the 1918 flu epidemic resulted in findings that an opportunistic bacterial infection may have been more responsible for the number of deaths, rather than the original flu virus itself,^[12] an important consideration for future pandemic planning.

New ICTs, increase in the size of collaborations, and data-intensive practices: these three trends, when taken together, probably account for the “information explosion” in the biological sciences more than any other factors. Collaboration across disciplines and informatics

together have made the biological sciences extremely data intensive. The former has enabled scientists to use equipment and resources in distant locations and answer increasingly complex problems with the help of colleagues with very different disciplinary interests. Informatics is entwined with this collaboration, since it implies the integration of biological sciences with computational power. Of course, policy initiatives and financial resources to back them can spur such efforts to greater success.

VARIETIES AND FORMATS OF INFORMATION

An early model by which biological information is organized is the UNISIST model, developed by the United Nations Educational, Scientific, and Cultural Organization (UNESCO) and the International Council of Scientific Unions (ICSU), and more recently updated by Fjordback S ndergaard et al.^[13] In this model, three channels of information: tabular (or data), formal, and informal channels are defined, with three levels of information (primary, secondary, such as abstracting and indexing services, and tertiary, such as encyclopedias). This makes a good departure point, but is hardly complete.

Much biological data is still recorded on paper. Many researchers in the biological sciences still use bound laboratory notebooks in the conduct of their daily work. Paper notebooks may seem antiquated because they are not easy to search in or integrate data, but they are still prevalent and mainstream in science classrooms and many academic laboratories, which provide the fundamental education for scientists.^[14] Paper notebooks are a form of data capture that are easy to understand and use, transcend computer technology that breaks or becomes outdated, are fairly simple to maintain for short- and long-term use, and do not require any proprietary systems. They are also effective mechanisms for integrating printouts, drawings, spreadsheets, and other data formats.

Digital data, not surprisingly, is far more diverse in scope. Specialized instruments usually generate data files in proprietary formats; often, these data are further manipulated using computer-based analytical tools or integrated with other data formats. Common data formats, such as those from Microsoft and Adobe products are prevalent, but others are more specialized from manufacturers of scientific equipment. Other data, although technical, are in formats that have become standard in scientific fields: GIS, for example, generate data in a range of formats that are universally accepted and used by scientists. Still other data are often generated within and managed by "collaboratories,"^[15] closed groupware or collaborative systems that are built for or around a particular project or group that is heavily dependent on digital technologies.

These cover the general scope of primary resources in the biological sciences, but the data is analyzed and

synthesized into various formats for dissemination outside of the immediate laboratory or research group. The range of publication formats is also numerous, and the reliance on different kinds of materials varies greatly by discipline and by individual preference. For example, to circumvent publishers' embargos on current research and the high costs of publications, many scientific communities created their own systems for circulating preprints and obtaining comments. While these have been extremely successful in the physical sciences, there has been significantly less use of preprint or e-print servers in the biological sciences.^[16] Conference papers, conference posters, monographs, reference manuals, and publications in peer-reviewed journals are all important sources of biological information. Conferences and workshops will often maintain Web sites where publications from previous years can be found. In addition to general journals that may cover a wide range of scientific disciplines (such as *Nature*, one of its related journals, or *Science*), many scientists use more specialized peer-reviewed journals.

Although they may not be considered biological information per se, it is important to note another major category of documents that are important to the biological sciences: administrative materials. Scientists are responsible for obtaining grants and administering them, advising students, dealing with personnel matters, serving on peer review committees for journals and granting agencies, and depending on the status of the scientist, serving on conference and institutional, national, and other committees and boards. Many scientists may serve in multiple capacities as educators, consultants, researchers, and the like. In the context of these roles, scientists generate an enormous amount of information that may not be seen as important to the generation of biological knowledge, but are of incalculable value to other stakeholders with an interest in matters in the processes by which science is conducted.^[17]

INFORMATION AND DATA REPOSITORIES IN THE BIOLOGICAL SCIENCES

Data and other information in the biological sciences is, not surprisingly, stored in distinct and various locations, physical, virtual, and both. Laboratory notebooks and digital files tend to stay within the academic laboratories that created them, just as information in the commercial sector or government laboratories tend to stay within those institutions. In the latter case, digital data sets are not retained by the National Archives and Records Administration (NARA), but, in the best of circumstances, in the archives and records centers of these laboratories. More often, they are left in the custody of the scientists whose laboratories generated them.

Because their creators often consider these documents useless once they have been used for formal publications, they tend to be regarded without much interest for long-

term maintenance and preservation.^[17–19] There have been many institutional efforts to organize and contextualize data sets of long-term value as there has been some interest in repurposing them for other projects or having an easily accessible historical trail. Documents have been useful to historians and others with interest in scientific activity, so there is still interest in their long-term preservation. However, inactive documents and records often do not end up in archives of science for permanent retention, unless the director of the laboratory is extremely prominent. Even then, many archivists of science are reluctant to accept “raw” data, which is impossible to interpret without the aid of context in the form of the publications that resulted from them.^[17,20] Nevertheless, there are many archives of science around the world, often focused around specific individuals, institutions, disciplines or subdisciplines, or topics. These archives may include the personal and scientific papers of individuals and professional/academic societies, important instruments, and key artifacts. There are far too many to enumerate, but some interesting examples include the John C. Liebeskind Collection at the University of California at Los Angeles, the only history of pain collection in the world. BrightSparks, a resource for finding collections about Australian scientists serves as a pointer to the physical location of archival collections. Like the BrightSparks collection, there have been many efforts to make the finding aids of these collections available online, but digitizing the materials themselves is difficult and expensive, so few archival scientific collections are available online in their entirety.

Scientific publications are a crucial resource for obtaining peer-reviewed research results. Publicly funded and proprietary databases index and if necessary create abstracts for this literature, making it accessible to individual and institutional subscribers, and in the case of publicly funded databases, the broader public. Examples include the National Library of Medicine’s PubMed-Central, and proprietary databases from other commercial publishers such as the Web of Science. For reasons similar to the impetus for e-print and preprint repositories, there have been some institutional efforts to circumvent the traditional scientific publishing model, which many critics argue favors publishers at the expense of scientists and the institutions at which they work.^[21,22] These critics charge publishers with creating a model in which universities and similar institutions subsidize research publishing, and then in turn pay for subscription rights to journals and secondary databases. However, given the imprimatur these systems lend to individual scientists in establishing their professional reputations, there has been little leeway and few incentives for them to break away from this system.

There have been some efforts to create open access models for more immediate and free access to scientific publications. One example is the Public Library of Science, championed and cofounded by the former director of the

National Institutes of Health Harold E. Varmus in late 2003. In addition to being a repository for publications and references, the Public Library of Science also encompasses several peer-reviewed open access journals in the biological sciences on a market-driven model in which scientists pay for publication, peer review, and online archiving.

The digital libraries movement has probably been the most influential in making biological data and other information broadly accessible and usable, particularly to non-experts.^[23] The creation of digital libraries has been instrumental in allowing educators and other nonexpert communities with interest in scientific data to minimize problems associated with information overload, poor structure, and the variable quality of scientific information available on the World Wide Web.^[24] Resources in digital libraries are organized and maintained, usually around a focused topic, and can encompass a variety of information types and formats that can support searching, reuse, and other interesting reuses of data and other scientific documents.^[25]

USERS OF BIOLOGICAL INFORMATION

Most evidently, the primary users of biological information are biologists themselves. It is impossible to characterize the biological research community in any general way. It is international, multidisciplinary, and collaborative. Biological scientists receive academic training in academic settings, but may work in universities, the private sector, in government laboratories, for nonprofits and civil society, and even as independent scholars and researchers (although this limits the kind of work they can do). As noted earlier, scientists are trained in an apprentice-based model in which they conduct research with senior scientists, working on projects of interest to the principal investigator. These researchers can be funded through a number of mechanisms, including government and foundation grants. Researchers can be found in other kinds of institutions as well. Although there has been significantly less biological research being conducted in the private sector in recent years, researchers in pharmaceutical companies and other biotechnology firms generate data and related information and are dependent upon multiple publication streams for disseminating results and keeping up with the current research, just like their academic counterparts.

Lastly, government laboratories and independent organizations throughout the world also employ these researchers. In the United States, the federal government administers few biological laboratories of its own; the vast majority of its resources are disseminated in the form of grants to scientists in other institutions. Nevertheless, government laboratories often conduct research in topics that may be of little financial interest to the private sector, such as therapies for rare illnesses, or clinical research.

Of course, biologists also work in non-Western countries; their information needs and challenges are different and often fraught with difficulties. While their needs for information may be as great as their Western counterparts, many characteristics of their situations make finding that information more difficult. Subscriptions to journals and secondary databases are often prohibitively expensive, even for institutional libraries and consortia of libraries. Most of these databases are no longer published in paper format, which would be the most useful for situations with uncertain power supplies and limited Internet access. Scholarly communication at conferences and workshops is of great importance to the biological community as informal networks are important to all kinds of researchers; however, the costs of travel and often the difficulties of obtaining foreign visas make these options difficult in many situations and often marginalize scientific researchers outside main research centers.^[26,27] To give one concrete example, the American Association for the Advancement of Science (AAAS), a nonprofit organization in Washington, District of Columbia, has argued that U.S. travel policies have made it extremely difficult for Cuban scientists to enter the United States to conduct legitimate research or attend important conferences.^[28] These scientists, much like junior researchers and those at institutions that are considered less research oriented, are generally deemed peripheral to the core research networks; this in turn, further marginalizes their work and thus they find it harder to get and share important information.

There are other scholarly communities with interests in studying science from social science, behavioral, and humanistic perspectives. These transdisciplinary areas of scholarship are often grouped under terms like “science, technology, and society,” or “science studies”; these terms are used to denote research interests that generally focus on science as a practice and epistemology with methodologies drawn from the social and behavioral sciences and humanities. History of science is one obvious area in which researchers rely on documents and artifacts produced by and about scientists. Philosophers, anthropologists, and sociologists of science also use similar artifacts and documents, such as journal articles, to make and situate their claims about science itself.^[29] There are also other areas of research that may require use of biological information, such as bioethics. In general, there has not been much research into the specific ways in which this community uses biological (or for that matter, any) information, so it is difficult to state categorically what kinds of information are useful to this category of researchers. However, it is likely that their practices mirror those of other interdisciplinary fields in which attendance at workshops and conferences, collaborations with biological researchers and other scholars, and wide literature searching are important resources.^[30]

The introduction of digital libraries has been extremely useful for the educational community. There are a number

of reasons why educators have collaborated with computer scientists, biological scientists, and information scientists to create digital libraries. Although the biological sciences have been less affected than other scientific disciplines, concerns in the United States regarding the low interest of students in pursuing advanced degrees and subsequent careers in the sciences has led to new models of engaging students at younger ages. One way in which this challenge is being approached is through the use of real data to address real scientific problems and learn the processes of science as scientists themselves conduct it, one approach to what is often called “inquiry-based learning.”^[31,32] Much of the impetus to move toward more inquiry-based approaches for teaching science stemmed from the 1996 release of the National Science Education Standards (NSES) for grades K-12, which articulated numerous disconnects between classroom teaching and the ability of science students to connect their learning to science in the “real world.” Other studies have found that these problems persist in undergraduate science education. Furthermore, the sciences have found a decline in the number of women and underrepresented minorities in the sciences (though the biological sciences have again been less affected). Some reports have suggested that one way to engage these students might be through exposing them to real-world problems that can be addressed through scientific inquiry.^[33] Biological digital libraries have been used to support these efforts, since materials can easily be added to them to contextualize scientific data sets with age and level appropriate information.

However, researchers have noted that without “pedagogical alignment,” the potential of digital libraries to foster sophisticated inquiry cannot be fully realized. Instead, they serve as yet another “information silo” in which students conduct artificial projects and teachers then move on to other lessons. In short, the science curriculum and specific learning activities must align appropriately with the content and organization of the digital library itself.

More specifically for the biological sciences, research and implementation has suggested that participation in research is important for life science education,^[34] but that this is not necessarily feasible for all undergraduates in life science undergraduate programs. The use of biological data in the classroom and inquiry-based approaches may provide substitutes, however. Reading primary papers, designing “real-life experiments,” analyzing data, and reading primary papers have all been employed to further information competence and fluency, although this material can be enormously challenging to the undergraduate student.^[35,36]

Another important category of users is organizations and individuals involved in foundations, policy making, and advocacy (these communities are not necessarily the same, although there may be some overlap). Examples include data on disease prevalence, land use planning, and environmental information, though there are many others. These users may or may not have scientific training, but

may be working with others who do to get help in interpreting the literature. There is also an enormous range of “policy makers,” from local officials and planners^[37] to members of Congress, as well as scientists and bureaucrats within government agencies. Transgovernmental organizations are also significant users of scientific information. Relying on primary evidence is considered necessary to making science-based policy in environmental affairs, health care, new biomedical technologies, as well as many other areas of science and technology policy. These users are not likely to delve into the primary literature of biology, much less the primary data sources. Therefore, task forces and expert panels may be convened to assemble the state of the art on important topics; policy makers may also rely on information from the Congressional Research Service nongovernmental “think tanks,” some of which have partisan agendas and others that do not. In the United States, the National Research Council (NRC) and Institute of Medicine (IOM) are two quasi-governmental organizations that are tasked with providing expert opinion on various issues through the form of reports to the U.S. Congress and executive branch agencies; their reports are available to the public. Policy making, however, is both a political and a scientific process, and that complicates the ways in which it is used. Some argue that scientific information with policy implications is not useful when specifically targeted to this population; instead, synthesized consensus on such topics should be targeted to those who have the power to influence policy makers.^[38]

Another important group of users that rely on and even contribute to biological knowledge are interested amateurs. Some of them may be interested in data-driven approaches to social and political change. Again, these users represent a diverse set of interests, abilities, and needs. They may be geographically localized groups with an interest in environmental issues in their community,^[39] activist organizations that mobilize around a particular illness for personal, policy, and social change (AIDS activists are among the most well-known group, but there are many others),^[40] or global movements interested in effecting change on transnational issues. Individuals may be interested in obtaining the latest scientific information for personal knowledge. They may be involved in what is often called “citizen-science” for personal reasons; these users are often involved in research efforts in ornithology, biodiversity, and other observational fields.^[41,42] Many of the problems that plague other communities outside of the sciences persist: vast quantities of information that may or may not be valid, highly technical information, and few vetted pathways through that maze.

CHALLENGES AND CONCERNS

There are numerous open challenges to understanding the nature of biological information and making it useful. One

central issue for practice and research is the issue of data sharing. The National Institutes of Health, for example, argues that data sharing is necessary to develop new analytical tools, encourage supporting studies, enable interdisciplinary research, and prevent duplication of efforts. To this end, NSF and some other grantmaking agencies require a data-sharing plan in grant proposals. In spite of an ethos of information sharing, data sets in the sciences, even those with wide import and use, are often “siloeed” or not preserved in useful formats. There are many reasons for this—lack of time, resources, interest, and incentives for data sharing are all cited as barriers to true information exchange.^[43,44] This varies from scientific community to community, though there have been extensive calls for data sharing in the broader scientific literature. It is often argued by scientists themselves that most information sharing is done in the form of peer-reviewed workshop papers, conference presentations, journal articles, and informal networks; therefore, sharing “raw data” is not feasible, since it would require setting up a dedicated data repository, responding to many individual requests, and other mechanisms that may be time consuming.^[45] Committing long-term resources to the maintenance of data only seems feasible in fields that are highly data intensive and “cutting edge.”

The fields of genomics and protein chemistry have publicly available databases and extensive toolkits for data analysis (examples include GenBank and RefSeq); these efforts are usually developed and implemented by various branches of the federal government, such as the National Library of Medicine’s National Center for Biotechnology Information (NCBI). Data deposited to these databases is centrally maintained and curated. Many journals in molecular biology and related fields require submission of novel genetic or protein sequences before publication so that the accession number can appear in it. Europe and Japan have similar databases (EMBL and DNA Database of Japan, respectively), but work in collaboration with NCBI. Increasingly, many data are proprietary, as they are produced in the commercial sector, or in collaboration with commercial firms. The formal results of analyses of these data sets may be made public in publications, but the raw data is not made available for reuse.

Another concern is preservation and curation, not just of data, but also of the contextual information that is often of greater use to those outside of the biological communities. These are a complex set of concerns, both social and technical. Issues of digital preservation that haunt other arenas include problems with media, differing approaches, and metadata. These are issues that most laboratories do not routinely consider. Making information and data available to the scientific community requires appropriate architectures, integration of data formats, and agreements on the funding and labor required to maintain such systems.^[46]

But to make scientific information accessible to the nonscientist, even more challenges ensue. There is certainly interest in access to such data, since at least in the United States, data sets that are funded by public resources are expected to be made public in some format. Digital libraries have been one approach to mitigating the access problem, but these are designed for educational users, not activists or policy making. For the researcher who needs access to the material that is produced as a by-product of research, such as grant applications and letters, the problems may be one of too much information in too many places, all of it ephemeral, much of it not easily integrated with other data sources.^[47] Much of the work that has been done on mapping formal and informal communication networks, history of science, and similar fields was only possible with the preservation of letters and documents in archives, or at least in other accessible settings and conditions. However, much of the current practice of science is done online: in e-mail, word processors, and proprietary software or groupware. The transient nature of these systems requires more intensive preservation efforts than paper-based data sets, and if insufficient efforts are made to preserve this material, institutions end up creating what might be termed a “memory crisis”^[48] for contemporary science. This problem will only get worse, as the kinds of technologies that scientists use become less and less amenable to digital preservation. It is still an open question, though, as to what needs to be saved at all for future use.

CONCLUSIONS

In the research community, current focus is, not surprisingly, on the vast array of digital data being created and used, and a suite of pressing concerns with access, storage, analysis, and policy around it. But it is worth remembering that a significant amount of information is still generated on paper, in laboratories, by researchers and their students, and that this information is just as difficult to access. The ways in which these different kinds of information are generated are, not surprisingly, not always mutually exclusive. Furthermore, the kinds of information that are often of greatest interest to the nonexpert community is information that is increasingly difficult to access, or ephemeral. The users themselves are an extremely diverse group with differing needs; making biological information useful and accessible for all potential user groups is a daunting task and one that is probably impossible. Lastly, it is important to note that access to biological information is not just a set of technical problems; there are deep reasons of practice and policy that also shape storage, access, and use patterns. Most of these areas pose emerging questions of research and practice.

ACKNOWLEDGMENTS

The author wishes to thank Jacob Warner for his research assistance, Barbara Andrews and Emily Maguire for reading preliminary drafts of this work, and the anonymous reviewer for extremely helpful suggestions for revision.

Blind and Physically Disabled: Library Services

Jane Rosetta Virginia Caulton

Stephen Prine

Library of Congress, Washington, District of Columbia, U.S.A.

Abstract

Library service for individuals who are blind or have a physical disability is an ever-expanding phenomenon, thanks to both the innovative spirit of the users and advances in technology. This entry discusses the 1931 establishment and subsequent growth of the National Library Service for the Blind and Physically Handicapped, Library of Congress. The importance of the network of cooperating agencies at the state and local levels and of the volunteers who support the program is also discussed. The entry presents the history of special-format reading materials in the United States. Specifically covered are the emergence of electronic braille and the development of digital audiobooks, both of which are accessible by smartphone.

INTRODUCTION

The path to providing quality library service to people who cannot read regular print with corrective lenses or who cannot handle printed materials because of a physical disability has experienced many advances, twists, and setbacks. The commitment and dedication of individuals and organizations and developments in braille and recording technology have combined to significantly improve access to written materials for all. The National Library Service for the Blind and Physically Handicapped (NLS)—a program of the Library of Congress—and its network of cooperating libraries have evolved from events dating back to the 1860s and are part of this expanding landscape. Together they form a unique organization of cooperative federal, state, and local programs that serve eligible residents of the United States and its territories and U.S. citizens living abroad.

This network, one of the oldest in the country, has its origins in the Act to Provide Books for the Blind—commonly called the Pratt–Smoot Act—which was signed into law in 1931. In the cooperative arrangement, NLS serves as the administrative agency responsible for selecting print books and magazines to be added to the national collections, for contracting with various entities to produce them in braille and audio formats, and for ensuring the availability of playback equipment. Cooperating libraries handle the daily interface with patrons; ensure that the books, magazines, and playback equipment are circulated to registered readers (see Fig. 1); and maintain necessary records on readership and inventory. This relationship between NLS and its affiliates is based on an informal agreement, which has been acceptable for the establishment of distribution centers (which now include regional libraries, subregional libraries, and advisory and outreach centers) since the program's inception.

Several other elements played vital roles in the effectiveness of the program: Free Matter postal legislation,

volunteers, the goodwill of authors and publishers, and later P.L.104-197 (known as the Chafee Amendment), which granted copyright permissions at no cost. The combination of these diverse elements made it possible for the program, in 2013, to serve more than 929,939 eligible readers. In that year, NLS circulated more than 24 million copies of the 217,896 titles included in its *Union Catalog*.

HISTORY

In the nineteenth century, library service for blind people was virtually nonexistent. In 1868, the Boston Public Library acquired a collection of books in an embossed format and began serving local residents. The Chicago Public Library followed in 1894, the New York State Library in 1895, the Library of Congress in 1897, and the Free Library of Philadelphia in 1899. Other collections were established, but most served only local populations. Several different systems of embossed formats were used by various library providers. Readers who learned one system could not necessarily read others. In addition, libraries could purchase only a few titles because of the high cost of production. These issues severely limited the ability of people who were blind to enjoy the same access to information as their sighted neighbors.

In 1917, the United States adopted the Revised Braille (known then as grade 1-1/2 braille) code as the standard for embossed materials. The system was invented in France in 1821 by Louis Braille, who used a military code as a model. The braille code is based on a six-dot cell, three rows high and two dots wide. Dots in the cell are raised according to the letters or numbers the dots represent (Fig. 2). Since its introduction, the code has been revised to accommodate changes in language and usage. Grade 1-1/2 braille integrates elements of the letter-for-

Fig. 1 A government worker teaches a blind veteran to use a digital talking-book player. Talking books enable individuals who are blind, are visually impaired, or have a physical disability that prevents handling print materials to access books and magazines. The National Library Service for the Blind and Physically Handicapped, Library of Congress, collections include bestsellers, biographies, and self-help materials.

letter transliteration of uncontracted braille and the abbreviated form of contracted braille. By 1925, the Library of Congress Reading Room for the Blind had expanded its readership from about 150 local readers to 2400 national patrons, and the collection had grown to 2400 volumes. Although improved, library service for blind people was still fairly sparse and the standard braille used today had not yet been adopted.

Recognizing the need for a centralized national library service, blind citizens and their advocates combined their efforts to acquire transcribed materials with coordinating economies of scale. Organizations serving blind individuals, including the American Foundation for the Blind in New York, the American Printing House for the Blind in Louisville, and the Braille Institute of America in Los Angeles, began to lobby Congress. In 1930, three bills addressing the issue were introduced in the House of Representatives and one in the Senate. The bills introduced by Congresswoman Ruth Pratt of New York and Senator Reed Smoot of Utah survived.

NETWORK OF COOPERATING LIBRARIES

The passage of the Act to Provide Books for the Blind (the Pratt–Smoot Act) and its signing into law on March 3, 1931, by President Herbert Hoover, created the first national free library service for people who were blind. The Act reads:

That there is hereby authorized to be appropriated annually to the Library of Congress, in addition to appropriations otherwise made to said Library, the sum of \$100,000, which sum shall be expended under the direction of the Librarian of Congress to provide books for the use of adult blind residents of the United States, including the several States, Territories, insular possessions, and the District of Columbia.

Braille Alphabet

The six dots of the braille cell are arranged and numbered:

```

1  ●  4
2  ●  5
3  ●  6

```

The capital sign, dot 6, placed before a letter makes a capital letter.

```

1  4
2  ●  5
3  ●  6

```

The number sign, dots 3, 4, 5, 6, placed before the characters a through j, makes the numbers 1 through 0. For example: a preceded by the number sign is 1, b is 2, etc.

a	b	c	d	e	f	g	h	i	j
⠁	⠃	⠉	⠙	⠑	⠕	⠗	⠎	⠓	⠚
k	l	m	n	o	p	q	r	s	t
⠅	⠇	⠓	⠝	⠏	⠖	⠗	⠞	⠡	⠞
u	v	w	x	y	z	Capital Sign	Number Sign	Period	Comma
⠩	⠪	⠻	⠭	⠽	⠿	⠠	⠠	⠠	⠠

```

1  ●  4
2  ●  5
3  ●  6

```

for the Blind and
Physically Handicapped

LIBRARY OF CONGRESS

Fig. 2 The Braille cell, an arrangement of six dots, is the basic unit for reading and writing Braille. The image above shows the Braille code for the English alphabet.

The Pratt–Smoot Act also acknowledged the necessity of localized service:

The Librarian of Congress may arrange with such libraries as he may judge appropriate to serve as local or regional centers for the circulation of such books, under such conditions and regulations as he may prescribe. In the lending of such books preference at all times shall be given to the needs of blind persons who have been honorably discharged from the United States military or naval service. (Sec. 2)

The year the law was signed, 19 libraries from around the country, including the Library of Congress, circulated books in embossed formats. Two more joined the following year. These libraries, which formed the nucleus of the modern network of cooperating libraries, were called regional distribution centers.

In 1933 the Pratt–Smoot Act was amended to include books “published either in raised characters, or on sound reproduction records, or in any other form.” This change sparked an expansion of the network from 21 to 26 regional libraries by 1934. A second growth spurt began in 1950 and extended through 1976, ending with a total of 56 regional libraries.

During this latter period, the legislation received additional amendments. In 1952, the word “adult” was removed, permitting the braille and talking-book program to serve blind children; in 1962, a library of “musical scores, instructional texts, and other specialized materials” was established; and in 1966, Congress provided for the reading needs of “blind and other physically handicapped residents.” All of these changes were codified in Public Law 89–522 and approved on July 30, 1966.

With the growth in responsibility, the Library of Congress expanded the Service to the Blind project to Books for the Adult Blind. The unit became the Division of Books for the Adult Blind in 1943, later the Division for the Blind (1952), then the Division for the Blind and Physically Handicapped (1966), and finally the National Library Service for the Blind and Physically Handicapped (1978).

The 57th regional library was established in Bismarck, North Dakota, in 1995, leaving only Wyoming without its own special-format library. Wyoming’s patrons are served under contract by the Utah regional library. The network organized into four regions—the Midlands, North, South, and West—to facilitate interlibrary support, help librarians keep abreast of industry issues, and share information. Since 2009, two regional libraries in the Midlands have discontinued service. In each instance, however, a second regional library in the state assumed service for all eligible residents.

Subregional libraries: In the late 1960s, the concept of providing reading service through local entities emerged. Subregional libraries are extensions of the regional

libraries, although they typically are funded separately and may report to a different parent organization. The NLS annual report for fiscal year 1971 shows records that the network had four subregionals in Alabama, six in Kansas, and one in Nebraska. By the mid-1980s, these had been joined by 93 others for a total of 104. Since then, however, many subregionals have fallen victim to budget cuts. In July 2014, the network had 36 subregional libraries: 6 in the Midlands, 4 in the North, 23 in the South, and 3 in the West.

Advisory and outreach centers: The economic crisis that hit America starting in 2008 resulted in the constriction of the NLS network of cooperating libraries. As funding for public libraries decreased, many subregional libraries closed. In 2011, advisory and outreach centers were introduced to the network. Georgia and Kansas replaced their subregional libraries with advisory and outreach centers, which provide reader advisors to assist patrons with service issues and conduct outreach activities. Other states have followed suit and the network now includes a total of 15 advisory and outreach centers: 12 in the Midlands, 1 in the North, and 2 in the South.

Machine-lending agencies and multistate centers: When Congress authorized the Library of Congress to issue talking-book machines (TBMs) to eligible individuals for the purpose of reading, the agency established distribution centers. The centers were important to NLS’s ability to track machine placement. Today most regional libraries provide machine services to their patrons. Separate machine-lending agencies (MLAs) in Minnesota, North Dakota, and Ohio support regional libraries that do not loan playback equipment, and one in Wyoming provides playback equipment to eligible residents in the state who receive library service from Utah.

The current network is also supported by two warehouse facilities called multistate centers. The Multistate Center East (MSCE) in Cincinnati, Ohio, handles the storage and distribution needs of regional libraries east of the Mississippi River, including those in the territories of Puerto Rico, and the U.S. Virgin Islands. It manages the audio and braille foreign-language collection and, since the early 1980s, has conducted the network’s Quality Assurance Program to ensure the consistency and quality of locally produced audiobooks and magazines. The second facility, Multistate Center West, in Salt Lake City, Utah, serves libraries west of the Mississippi, including those in Alaska, Hawaii, and Guam. It also is the repository for special braille collections (Fig. 3) and for NLS playback equipment.

POPULATION SERVED

The free library service administered by NLS is available to any resident of the United States who is unable to read standard print because of blindness, visual impairment, or

Fig. 3 Print-Braille books from the National Library Service for the Blind and Physically Handicapped, Library of Congress, enable blind parents to share reading with their sighted children.

a physical disability that prevents holding a book or turning pages. Service is available on a temporary or long-term basis.

The majority of program users fit into one of two broad categories. First are individuals who are born blind, visually impaired, or with a physical limitation. Once individuals from this group learn about the program and apply for service, they may use it throughout their lives. The second group—the larger of the two—are individuals who become eligible later in life because of an age-related illness or disease. Arthritis, diabetes, glaucoma, and macular degeneration are the most common causes for eligibility. A subcategory of this group includes those who lose the ability to use print because of an accidental injury.

Currently, 69% of active readers in the program are 60 yr of age or older. The onset of a condition, later in life, that makes them eligible for the program has tended to make readers who are in their 1960s or older the primary users of this program. In fact, more than 3600 readers are more than 100 yr old.

It is important to note that veterans are given primary preference by law. As stated in Section 2 of An Act to Provide Books for the Adult Blind,

In the lending of such books preference shall at all times be given to the needs of blind persons who have been

honorably discharged from the United States military or naval service.

According to the Blinded Veterans Association, 7000 aging veterans become blind each year as a result of macular degeneration, retinitis pigmentosa, glaucoma, or diabetic retinopathy. In addition, approximately 13% of the wounded soldiers returning from the Middle East have sustained visual impairment of some type. The free library service that NLS provides assures that they will be able to continue to access the written word.

THE LIBRARY COLLECTION

The braille and talking-book collection of titles was established on the ideology that eligible readers should have access to the same type of materials found in public libraries for the sighted population. The collection emphasizes recreational and informational reading material. Among the nonfiction and fiction titles, including classics and bestsellers, patrons may select from a wide range of genres. Biographies, political commentaries, religion, and science titles may be found among the nonfiction offerings, while stories about mysteries, romances, science fiction, and westerns are popular fiction selections. Age-appropriate titles in similar categories are also available for younger readers. Though most of the offerings are English, the collection includes foreign-language materials, principally Spanish. The collection also offers subscriptions to popular magazines, selected for special format according to patron interest. The *NLS Collection Building Policy* explains that the interests of “the aged, the young, professional people, and other specific groups [are to be] reflected proportionally in the collections in relation to the overall readership served.”

As patron consideration is an important aspect of service, NLS is aided in its collection-building activities by a group that meets biennially. The National Collection Advisory Group includes patrons, librarians, and representatives of constituency organizations who gather information from their peers to recommend strategies for NLS to consider when making selections for the titles. Principles guiding selection are to ensure that titles are available to meet the interests of a population with broad and diverse interests, tastes, and reading levels. The *NLS Collection Building Policy* bases consideration of nonfiction titles on the following:

1. Broad trends in public interests, knowledge of developing theories and practices in the various subject areas, and availability of appropriate titles
2. Materials in areas of particular interest to readers, classic and standard materials, contemporary works, specialized works of interest to educated laymen, and works with potential informational reading reference

Annually, NLS seeks to add 3000 titles in audiobook format and about 500 titles in braille. Ratios of titles selected for audiobooks in each subject area are 60% fiction to 40% nonfiction, 70% current to 30% retrospective, and 80% adult to 20% juvenile. Braille, however, is selected based on cost: the larger and/or more complex the title, the higher the production costs. "For example: Stephen King's novel *11/22/63* contains 1576 transcribed pages in eleven volumes. NLS produced forty-three copies of 7,768 braille pages each, which cost \$23,300" (*The Future of Braille*, 2014).

MUSIC LIBRARY SERVICES

A special music collection for blind persons was authorized by Congress as part of the national free library program in 1962. The collection became the basis for the music program administered through the NLS Music Section. These services, extended to individuals with disabilities in 1966, are provided directly to eligible individuals from Washington, DC. In effect, the Music Section is the national music library for people who are blind and visually impaired or have a disability.

The collection offers braille, large-print, and recorded instructional materials about music and musicians. More than 30,000 titles in audio, braille, and large-print music scores, texts, and other instructional materials (in excess of 100,000 volumes) are available. Some materials are purchased from national and international commercial sources. Other items are selected and produced in audio and braille formats by NLS with the permission of composers, authors, and publishers. Some titles are developed solely for the NLS program. Patrons may also obtain free subscriptions to several magazines produced in audio, braille, and large print. Musical recordings intended solely for listening are not included in the music collection as they are readily available commercially and from public libraries.

BRAILLE AND TALKING BOOKS

Within 2 yr of the Pratt–Smoot Act becoming law, braille had become the standard for embossed reading materials in the United States. In 1931, the Division of Books for the Adult Blind selected 157 braille titles for the collection; and starting in 1934, the national program also offered sound recordings of books on 33-1/3 rotations per minute (rpm) rigid discs (records). The addition of talking books was especially well received because many individuals who were blind had never learned to read braille.

In 1935, the Works Progress Administration was allocated funding to build and repair record players for blind adults to read Library of Congress–produced recorded books. After World War II, Congress provided an

appropriation for the purchase of TBMs, which were distributed to regional libraries and MLAs for loan to eligible readers. By the mid-1960s, the Library of Congress began looking at ways to reduce the size and weight of the materials being handled by patrons, network library staffs, and the United States Postal Service (USPS). The first experiment slowed the speed of the 33-1/3 rpm record to 16-2/3 rpm, then to 8-1/3 rpm. Simultaneously, NLS began experimenting with providing books on magnetic tape. Initially, titles were produced on open-reel tape and loaned to readers who had access to open-reel tape players. While the tape technology proved effective, the open-reel format was inefficient. The experience, however, led NLS to the Phillips cassette, which was becoming the commercial recording industry standard. A C-90 Phillips cassette played for 45 min per side or 90 min overall at 1-7/8 inches per/second (ips).

NLS experimented with this format, at first reducing the play speed from 1-7/8 to 15/16 ips, which doubled the play time from 90 to 180 min. A second change was recording on four tracks instead of two, which added another 180 min. Unlike commercial cassettes that play for 1-1/2 hr, talking-book cassettes play for 6 hr. This format meant that readers needed to handle only a single cassette instead of four. The noncommercial speed prohibited talking books from being played on commercial machines, thereby ensuring copyright protection. The new format also qualified the books for Free Matter mailing.

TALKING-BOOK MACHINES

In 1947, the Library of Congress received its first appropriation for the purchase of special record players. From its introduction in 1935 through the transition to the cassette machine in 1971, the TBM was continuously modified to achieve peak performance. In the first decade, attention was given to the motor, pickup arm, and amplifier. In the 1950s, motor speeds began increasing to accommodate 33-1/3, 16-2/3 rpm, and, by 1965, 8-1/3 rpm. A lightweight model with a transistorized amplifier and plastic case was introduced in 1968. In the early 1970s, the TBM was further refined with an automatic cut-off switch, two-sided needle, and a detachable lid that held the speaker. The last model was joined by a cassette player and called the combination machine. It allowed patrons to play magazines on discs and audiobooks on cassettes, which were introduced in 1971.

Cassette machines debuted in two models: a playback-only and a record-and-play designed for students. The playback-only held a rechargeable nickel–cadmium battery and the latter used size C dry-cell batteries. Both operated at 1-7/8 and 15/16 ips. Cassette machines were produced to accommodate the four-track cassette beginning in 1974, and in 1976 an automatic shutoff, tape

motion sensor, and variable speed control were added. The 1980 model included a pitch restoration model that retained the pitch even at higher speeds. The Easy Machine, a cassette machine operated by two controls, was introduced to assist readers with low dexterity. The machine started and stopped with a sliding door and had a button to rewind the tape.

QUALITY IMPROVEMENTS

Recognizing that analog cassette tape would become obsolete by the early twenty-first century, NLS began exploring alternative formats for recorded books in the late 1980s. A review of the market at the time indicated that the recording and distribution of books and magazines should be moved from an analog to a digital environment and that the output of digital books required a format robust enough to stand up to the extensive handling and mailing that circulating machines and audiobooks between libraries and patrons entails.

By the mid-1990s, it was clear that digital technology would become the accepted medium. Digital recordings had emerged in several formats: digital audiotape (DAT), digital compact cassette (DCC), compact disc (CD), digital video disc (DVD), and mini discs (a smaller compact disc developed by Sony). Each of these applications utilized digital recordings, but all were susceptible to the same weaknesses as their analog counterparts. DAT and DCC relied on magnetic tape for storage, and CD and DVD encountered fragility problems not recognized at their inception. The NLS search for a durable medium led to flash memory. It was costly, but market research indicated that by 2008 the cost would drop enough to make the medium affordable.

Under the National Information Standards Organization (NISO), part of the American National Standards

Institute (ANSI), an international team of experts and interested parties released the ANSI/NISO Z39.86, the first standard for digital talking books, in 2002. With the NISO standard in hand and flash memory designated as the format, NLS selected a company to design a proprietary digital TBM, a cartridge, and a cartridge container. The design phase was completed and approved in the spring of 2007, and manufacturing began in 2008. NLS launched its digital talking-book system in 2009.

The transition from analog to digital service was well received by users of the NLS program. The digital talking-book system includes a player—available in two models, a flash-memory cartridge, and the cartridge container (Fig. 4). Patrons enjoy the higher-quality sound, easy navigation, and convenience of an incremental shutoff button in the basic machine. The advanced machine offers additional features such as chapter-to-chapter navigation. Both machines weigh less than the cassette player and are easier to carry. The larger buttons accommodate individuals who have dexterity challenges.

BRAILLE AND TALKING-BOOKS SERVICE TO GO

Prior to the emergence of the digital audiobook system, NLS launched the Braille and Audio Reading Download (BARD) Internet service. BARD offers patrons the ability to have their reading material in a matter of minutes as opposed to the week or two required for regular circulation activities. Books and magazines may be downloaded from BARD and played on NLS or authorized commercial players.

Interest in developing the BARD service was spawned by the success of Web-Braille, the first NLS exploration into providing online access to its collections. Established in 1999, Web-Braille, a password-protected website, allowed patrons to access thousands of complete e-braille books and magazines in contracted (formerly known as

Fig. 4 The digital talking-book system issued by the National Library Service for the Blind and Physically Handicapped, Library of Congress, provides an improved reading experience. Patrons may choose a basic player (left) or an advanced player (right). A single cartridge, circulated in a lightweight plastic container, will hold most books.

grade 2) braille. Books were added to the Web-Braille site after production in press-braille (paper) distribution to braille-lending libraries. Patrons received log-on IDs through their network libraries and then accessed the site to download braille books and magazines using braille-embossing hardware.

In 2006, NLS used Web-Braille as a working model, as several elements had emerged to create an environment for establishing an audiobook download website. First, Adaptive Multi-Rate Wideband Plus, an audio compression algorithm, had been selected as the best code-decode (codec) for ensuring high-quality human-voice recording for digital production. Second, a scheme for digital rights management to ensure copyright protection had been developed; and third, a compatible digital machine had been produced. Together they presented an opportunity for NLS to make the large collection of digital audio files it had amassed in preparation for the digital talking-book system available online.

In October 2006, NLS began testing the system's usability by launching its downloadable book pilot. A year later the pilot was expanded to the present BARD system. The password-protected website provides access to thousands of recorded and braille books and magazines, with weekly additions. In 2013, Web-Braille merged with BARD, and in 2014, network libraries were invited to submit their locally produced books and magazines for inclusion on BARD. More than 60,000 patrons are registered users of the website, which has more than 50,000 book titles and 94 magazine titles. Patrons may also download instructional music materials and some foreign-language books and magazines.

BARD Mobile: Always scanning the technological environment for opportunities to improve reading accessibility for individuals who cannot see to read regular print or handle printed materials, NLS turned its attention to smartphones. In September 2013, NLS successfully launched BARD Mobile, a software application that enables registered patrons to download audio and braille books and magazines from the BARD website using an iPhone, iPad, or iPod touch. All aspects of the app were designed and developed to ensure complete accessibility and a premium patron experience, including navigability and download speed. Users must register for access through their network libraries.

Audiobook readers are able to use the device's built-in speaker, and braille readers are able to read e-braille books, magazines, and music scores using a refreshable braille display connected via Bluetooth to their iOS devices. The new app increased the portability of the free library service and patrons expressed delight that it did not require special equipment; they can use the same type of devices as their sighted peers. About 5000 patrons signed up for BARD Mobile within the first week of release. In the first year, more than 10,000 users had registered for the app and registered 17,200 devices.

EQUIPMENT REPAIR AND THE ROLE OF VOLUNTEERS

Because talking-book equipment is loaned, users had to return broken or defective equipment to their MLAs and wait to receive replacements. At first, machines that needed repair were handled by centralized repair facilities, but that often left readers waiting for weeks or months to get them back. Consequently, the Division of Books for the Adult Blind changed its policy and required MLAs to replace broken machines immediately. This requirement ensured that the reader would quickly receive a replacement player, but it also created a backlog of machines needing service. Repair at the local level was sporadic, mostly because the staff did not have the necessary technical background or training. This ongoing problem was resolved in 1960 when the program, by then the Division for the Blind, formed a partnership with a volunteer organization whose members had both technical background and the time to devote to repairing the playback equipment.

Machine-repair volunteers: The Telephone Pioneers of America, formed by long-tenured or retired telephone company employees, was a nationwide organization looking for public service projects. In 1959, the Division and the Pioneers launched a pilot machine-repair project. The success of this project proved mutually beneficial, and the Pioneers adopted the TBM-repair program as a project on June 6, 1960. This group, which in 2008 changed its name to Pioneers—A Volunteer Network, has provided decades of significant community service by repairing TBMs. In 1989, the General Electric (GE) Elfun Society, a group of retired GE employees who were also looking for a community service project, joined the NLS volunteer machine-repair program. Its repair facilities are in Fort Wayne, Indiana; Louisville, Kentucky; Lynn, Massachusetts; Schenectady, New York; Cincinnati, Ohio; Philadelphia, Pennsylvania; and Salem, Virginia. In 2006, this organization changed its name to GE Volunteers. Together Pioneers and GE Volunteers have provided millions of dollars in service to the talking-book program, network libraries, and their patrons. More than 288 repair sites still operate around the country, a tribute to the dedication of the men and women who volunteer.

Other volunteers: Volunteers have played a crucial role in ensuring that individuals who are blind or have a physical disability gained and retained access to reading materials. Even before the national program was set in place, volunteers began organizing to provide hand-copied braille materials to blinded veterans after World War I. The formation of such organizations required a method for ensuring the quality of braille transcription. The Library of Congress and the American Red Cross collaborated to produce a manual to guide the sighted transcribers and to establish a certification program. This program operated under the American Red Cross until 1943, when it was transferred to the Library of Congress.

Many braille transcriber groups operate across the United States. Some network libraries have braille-transcription programs that are supported by these volunteers. Others contribute to the network library system by donating materials or handling special assignments. Braille transcribers and proofreaders still must be certified by NLS, now handled under contract with the National Federation of the Blind in Baltimore, Maryland. Their efforts are guided by the *English Braille American Edition* and *Braille Formats: Principles of Print to Braille Transcription*, under the watchful eyes of such groups as the Braille Authority of North America (BANA) and the National Braille Association (NBA). BANA's mission statement reads in part that it "publishes rules, interprets and renders opinions pertaining to braille in all existing and future code" (<http://www.brailleauthority.org>), while the NBA provides professional development and training for transcribers.

Most positions in the audiobook recording industry are held by paid professionals; however, some network libraries and volunteer studios engage the help of volunteers to narrate, monitor, and review audiobooks. Books narrated by volunteers must meet the standards of narration established by NLS. In addition, volunteer-produced books nominated to the NLS *Union Catalog* must pass inspection by the NLS Quality Assurance Program at the MSCE.

Countless other volunteers help maintain library service by performing a variety of functions, from greeting visitors to inspecting and shelving returned books. These individuals contribute numerous hours to ensuring that patrons have access to reading materials. The network of cooperating libraries recognizes their work through commendations, awards, and/or special events.

COPYRIGHT

Copyright protection became an issue when talking books were introduced to the Books for the Adult Blind. At the program's inception, only embossed books, which could be used by only a small percentage of the population, were provided. Publishers did not perceive this special embossed format as a threat to their profit margins. Recorded books, however, were produced in a commercial format, so anyone who had a phonograph could use them. To address this issue, the Library of Congress set controls on recorded books. First, Books for the Adult Blind secured permission from the copyright owner to publish recorded books. Then, every recorded book contained an announcement acknowledging copyright permission and noting that the format was for blind users only.

In spite of these safeguards, publishers became more reluctant to grant permission for the special-format publications as demand for talking books grew. By 1936, the Library of Congress could only add books published before 1880, most of which were already available in braille or had been read by patrons who came to the program after losing

their sight as adults. The Book Publisher's Bureau proposed that publishers grant permission for a nominal fee or at no cost to the Library of Congress, which became a clearinghouse for the special-format permissions. It tracked the number of permissions requested, the number granted, and the number of recordings made. The American Foundation for the Blind and the American Printing House for the Blind, which held government contracts to produce the books, labeled talking books "Solely for the Use of the Blind." They also ensured that this message was narrated, along with the name of the publisher.

Stakeholders felt that maintaining tight controls on TBMs was the key to copyright protection. TBMs were strategically placed in central locations because only one machine was provided for every six blind individuals in the United States. The Books for the Adult Blind program was required to track the location of the players and to issue regulations on their loan, maintenance, and repair.

This program worked for decades, although even with the controls in place it was a slow process. Then in 1996, at the request of representatives from organizations of individuals who are blind or who provided services to them, Senator John Chafee of Rhode Island introduced Legislative Branch Appropriations Bill, H.R. 3754, to amend Chapter 1, Title 7 of the U.S. Code as follows:

It is not an infringement of copyright for an authorized entity to reproduce or to distribute copies or phonorecords of a previously published, nondramatic literary work if such copies or phonorecords are reproduced or distributed in specialized formats exclusively for use by blind or other persons with disabilities.

P.L.104-197, signed by President William Jefferson Clinton, effectively removed the need to request copyright permission for any U.S. nondramatic work intended for production in braille or recorded format specifically for readers who are blind and visually impaired or have a physical disability.

In 2013, NLS met with commercial audio publishers to discuss acquisitions of commercially recorded audio titles. Hachette Book Group of New York, New York, agreed to provide NLS with audio files at no cost. The relationship marked a major benchmark in the NLS effort to provide an ever-increasing selection of audio and braille titles for program users. Other publishers joined, and as a result, NLS increased its annual audio title offerings from 2000 to 3000. It must be noted that while the audio files have been donated, NLS must cover the costs of duplication and distribution.

FREE MATTER MAIL FOR BLIND AND HANDICAPPED INDIVIDUALS

The Free Matter for the Blind and Handicapped mailing privilege offered by the USPS predates the legislation that

established NLS. Originally passed by Congress in 1904, it allowed public institutions serving blind individuals, public libraries, and blind readers to mail embossed materials free of charge. Two requirements for Free Matter mailing are noted in the *Domestic Mail Manual* Section 703.5, “Free Matter for the Blind and Other Handicapped Persons.” First, the material being mailed must be in a special format intended for blind users such as braille; sight-saving type (i.e., 14-point or larger); recorded materials on cassette, records, or compact discs; or descriptive videos with audio narration. Second, the recipient of the material must be eligible to receive (and return) materials as Free Matter. The criteria specified include being an NLS patron, being blind or having a physical disability that prevents using printed materials, and being an American citizen or resident of the United States or its territories.

Residents of the United States who are eligible for braille or talking-book service are a microcosm of the general population, representing every age, gender, and socioeconomic status. The only generalization that can be made about these individuals is that their most common problem is mobility. As a consequence of their disability, they do not drive. Therefore being able to receive and return library materials through the USPS affords them a considerable degree of freedom and independence.

Free Matter postal service is vital to NLS and the network of cooperating libraries as it supports postage-free book circulation. Libraries mail books, magazines, and playback equipment to patrons free of charge. Once readers complete a book, they merely return it to the mail stream, and it is returned to the appropriate library. Without the Free Matter mailing privilege, the NLS free library service would not be nearly as successful. For the past decade, the NLS network of cooperating libraries has circulated approximately 23 million books and magazines annually, and approximately 20 million books are returned. Additionally, an untold number of playback machines, catalogs, newsletters, and order forms travel between patrons and libraries. Postal service employees who process and deliver these materials have been honored by individual network libraries for the dedication and concern NLS patrons report.

DEVELOPMENTS IN THE FIELD OF BRAILLE

The technological landscape of the twenty-first century flourished with opportunities for accessible options. Yet Braille has remained the primary literacy tool for individuals who are blind or visually impaired. The tactile format enables these people to engage in their environment by gaining the fundamental skills that make literacy possible. Amidst all of the change, however, Braille seemed to be at a standstill. In June 2013, NLS partnered with Perkins of Watertown, Massachusetts, to convene a conference

exploring the status of braille, with a mind to shaping policies to expand and support this important literacy tool.

Called “The Future of Braille,” the braille summit drew more than 100 librarians, educators, producers, engineers, and others to the Perkins campus to discuss issues and to formulate recommendations. Their major concerns were reducing the high cost of braille production, acquiring better technology and more training for instructors, and the need to expand knowledge about the medium. Stakeholders also heard from a representative of the U.S. Department of Education, which had just released a Dear Colleague letter advising educators to include braille in the individual education plans of qualifying students; the National Braille Press Center for Braille Innovation and the Daisy Consortium Transforming Braille Group on their efforts to produce a low-cost braille display; and the Braille Authority of North America on its adoption of the Unified English Braille code, an update of the braille code that has a set of rules applicable across the English language.

Participants recommended that NLS provide a refreshable braille display at no cost to patrons, vary the quality and/or publication medium of books depending on their use and expected shelf life, and work with publishers to acquire source texts. They also asked NLS to expand the use of tactile graphics in its books and to build support for efforts to update braille technology, specifications, and methods for selection, production (including production on demand), and distribution of braille materials. These recommendations will serve as a guide as NLS develops policy to better serve its braille readers.

FROM READER TO LEADER

On March 26, 2012, NLS marked another milestone in its development. For the first time since its establishment, the organization would be led by one of its patrons. Karen Keninger, who had lost her sight at age seven, was appointed director of the National Library Service for the Blind and Physically Handicapped. From 2008 until her appointment, she had served as the director of the Iowa Department for the Blind, where she oversaw statewide vocational rehabilitation and independent living programs and library services. Prior to that—from 2000 to 2008—she had served as director of the Iowa Library for the Blind and Physically Handicapped, where she planned and implemented a new, in-house digital recording program with a state-of-the-art recording studio.

Taking the helm of NLS, Keninger set five priorities for the program: 1) maintain the highest quality standards for all NLS products; 2) enhance the reading experience for all NLS patrons by leveraging current and future technologies to improve the reading and delivery systems; 3) expand the scope and quantity of titles available in alternative formats through the NLS system; 4) take a leading

role in positioning braille as a viable, practical, and achievable literacy medium for all blind Americans; and 5) increase readership. Under her leadership, NLS has released the BARD Mobile app, engaged support from commercial publishers, held the first braille summit, and made digital audio materials produced by network libraries available on BARD.

CONCLUSION

Library service for eligible residents of the United States and its territories and for its citizens living abroad continues to expand as technology changes and new needs are identified. Within the NLS network, many libraries, both regional and subregional, offer services beyond those provided by the Library of Congress, such as large-print books and descriptive videos. Many also host community activities, such as summer reading programs for children and book discussion groups. They house recording studios that record books and magazines, normally of local significance, supplementing the NLS *Union Catalog*.

The development of library service to individuals who are blind, are visually impaired, or have a physical disability represents the combined efforts of many people, organizations, and institutions. Among these, the most important have been the readers. Their contributions have been evident from Louis Braille's use of a military code to create a tactile alphabet through contemporary demands for accessible technology, including braille displays and smartphone apps, to the rise of a patron to leadership of the national service. As noted in *That All May Read: Library Service for Blind and Physically Handicapped People*, "This history reflects the growing recognition that [people who are blind or have a physical disability] have the same interests, intellectual capacity, and ambitions as other members of society and the determination that they enjoy the same benefits."

Bliss Bibliographic Classification First Edition [*ELIS Classic*]

Jack Mills

North-Western Polytechnic, London, U.K.

Abstract

Henry Evelyn Bliss was probably the greatest American contributor to the theory of the classification of library materials. The first edition of the classification scheme he developed is discussed here by a major British thinker in this area, Jack Mills. After some years of use, the scheme was extensively revised, under the Editorship of the same Jack Mills, and the resulting second edition of the Bliss Bibliographic Classification is discussed in the entry by that name.

—*ELIS Classic*, from 1969

INTRODUCTION

A substantial outline of the system of library classification^[1] known as the Bibliographic Classification (or Bliss Classification, or, simply, BC) was first published in 1935, and the full edition^[2] appeared in 1940–1953, making it the latest of the major general classifications for libraries to appear. It was the culmination of a life-long study of the problems of library classification by its author, Henry Evelyn Bliss (1870–1955). Bliss, who was associated for almost 50 years with the College of the City of New York, in fact, applied his system in an earlier form as long ago as 1908,^[3] when he reorganized the City College library. Subsequently, he undertook a very thorough investigation of the problems of organizing knowledge and the relevance to them of classification. He prepared the way for the publication of his full system using two works, both of them influential among librarians in the 1930s and 1940s, particularly in Great Britain. The first, *The Organization of Knowledge and the System of the Sciences*^[4] (described by John Dewey in its Introduction as a “monumental work”), appeared in 1929, and the second, *The Organization of Knowledge in Libraries*^[5] in 1933.

These two works set the scene for his classification in that they developed, after a thorough review of historical systems, both a comprehensive theoretical basis for the classification of knowledge and a set of pragmatic principles reflecting the functional requirements of documentary collections, the two combining to give the foundations of a bibliographic classification, i.e., one for documentary collections.

HISTORY

Extent of Use

Libraries began to adopt the BC as soon as the 1935 “System” appeared. By 1954, a year after the completion

of the full scheme, some 50 libraries had adopted it and the first issue of the *Bliss Classification Bulletin* appeared^[6] as a maintenance service for users. At first somewhat intermittent, it now appears regularly once a year; details of the service and of proposals for a new edition are given later in this entry. By 1967 more than 80 libraries had adopted the BC, and each year sees several more added to the total. These users are predominantly academic and learned libraries and government and special libraries. Most of them are in the British Commonwealth and only two are in the United States of America itself.^[7] In 1967 an abridged version of the scheme^[8] for use in schools was published by the (British) Schools Library Association.

Principles Underlying the BC

In the second edition of *The Organization of Knowledge in Libraries*, Bliss summarized the principles of classification for libraries under 32 headings. From these, five may be selected as of major significance in determining the characteristic features of the BC.

COLLOCATION

A library classification is a device for defining specific classes of information and for showing the relations existing between them. In this way it performs its basic function, which is to assist the retrieval of information from stores (libraries, bibliographies, indexes) by allowing a searcher first to locate a specific class in which relevant material is believed likely to be and then to make adjustments to the search (if necessary—and it usually is) by expanding or contracting the initial class according to whether too little relevant material or too much nonrelevant material is found in it. The second function is

achieved by *collocation*, i.e., bringing together in proximity those classes that are closely related.

Bliss attacked the alphabetical organization of information (which has been, throughout this century, the dominant form in American libraries) as serving adequately only the first function (of locating specific classes) when the needs of bibliographical searching make the second every bit as necessary. He argued that only systematic collocation could meet these needs and that this was the fundamental feature of a good classification, and it was only to be achieved by observance of certain basic principles governing the order of classes. The first of these was “consensus.”

CONSENSUS

Bliss believed that knowledge should be organized consistently with the “consensus of scientific and educational opinion,” since it is through the processes of science (in its broadest sense) and of education that we find that this organization is ultimately effected and its results systematized. This consensus, or agreement, he claimed, “is relatively stable and tends to become more so as theory and system become more definitely and permanently established in general and increasingly in detail.”^[5] The stability, Bliss argued, was a reflection of the fact that the system of knowledge was “correlative to the persistent order of nature.”

At its simplest, this notion was a conscious refinement of the basic assumption made, but never stated explicitly, by other major general classifications—the Decimal Classification, the Universal Decimal Classification (UDC), the Library of Congress, Colon—all based on the accepted “disciplines” of late-nineteenth-century Western society (although in the case of the Colon scheme, the framework of main classes and divisions reflecting this is its least significant feature). But Bliss went far beyond this almost intuitive assumption in his attempt to establish an acceptable consensus, which would at the same time display fundamental relations between classes with maximum efficiency.

This consensus is, to be sure, relative (to different viewpoints) and temporary. Bliss admitted this, but claimed for it an impressive weight of historical evidence, from the Stoic “triad” (logic, physics, ethics) to the more detailed structures of the nineteenth century philosophers, and particularly of Comte, Spencer, Ostwald, and Wundt.

GRADATION

A bibliographic classification must be presented as a serial or linear order, however complex the differences used to distinguish its classes. (At least, this is true of its use for the arrangements of documents on shelves and of entries

in a precoordinate index; it is not quite true of a classification used as an authority list or thesaurus for a post-coordinate index.) The two central relations underlying this serial order are subordination (of the special to the general) and coordination (of classes of the same rank, or order of division). While observing these two principles, Bliss recognized a further principle which seemed to incorporate elements of both. This was the principle of gradation in speciality:

A very important instance is that of the natural sciences arranged in order of *speciality*, each science being in one sense individual and coordinate with its fellow sciences, yet in another sense subordinate to that on which it is mainly dependent for concepts and principles and from which it is largely derived by specialization.^[4]

By this theory (advanced in various forms by a number of philosophers, particularly Comte, Spencer, and Ostwald) it is argued, for example, that physics, dealing as it does with the fundamental nature of matter and energy itself, is more “general” than chemistry, which studies organizations of matter and energy at a more specialized level. This “dependence” of chemistry on physics is seen in such critical areas as that of the theory of valency, in which the combining powers of chemical elements are explicable finally in terms of atomic structure.

It may be noted here that such a theory (which implies, for example, that all biological phenomena are ultimately explicable in terms of physics and chemistry) has obvious philosophical implications, as does the argument for consensus, which assumes that classes are correlative to a persistent order of an objectively verifiable, external nature. Bliss considered these implications at numerous points in his work, especially Chapter 10 of *The Organization of Knowledge and the System of the Sciences*.

Another interesting point is the close parallels that can be drawn between the order produced by gradation and that produced by applying the theory of integrative levels^[9] in which entities are organized in a sequence of increasing complexity, from fundamental particles to atoms, to molecular aggregates, to cells, and so forth.

ADAPTABILITY

The “adaptation of logical order to practical uses and to convenience thru collocation. . .” (*A Bibliographic Classification*, Vols. I–II. p. 23) recognizes the practical implications of the “relativity of knowledge and classes” and is another major principle in the BC. It takes the form of extensive provision for alternative locations and treatments, e.g., some technologies may be collocated with others in the technology class (U) or subordinated to the science that they largely reflect (as aeronautics, say, reflects aerodynamics); or, mineralogy may go with its

science crystallography, within chemistry, or under geochemistry, within geology; International law may go with international relations within political science or with law.

To implement this, extensive provision must be prepared in the notation for different decisions, and the BC provides this to a degree far excelling that of the other major schemes.

NOTATION

Bliss made valuable contributions to the theory and practice of notation, not least in his emphasis on notation being “correlative and subsidiary,” i.e., that it should not determine the display of relations achieved by the order of classes. In the BC, two principles of notation are particularly prominent. First, the use of “composite” notation to provide economically for the notational specification of different classes by recurrent concepts; this is the old principle of “divide like . . .” used by Dewey, and, while it is not taken as far as the provision of a fully faceted notation, it does allow notational synthesis on a scale comparable with that of the UDC. Second, the notation is quite the briefest of all the major schemes. Bliss considered brevity a major element in the acceptability of a notation and sought it for the BC in a number of ways.

The Classification

The basic sequence, its structure predominantly reflecting the principle of subordination of the general to the special and of gradation in speciality, is notably coherent and mnemonically clear:

Philosophy, Logic, Mathematics (i.e., “tool” studies, and Methodology)
 Physical sciences
 Physics
 Chemistry
 Astronomical systems and bodies
 Earth
 Biological sciences
 Botany
 Zoology
 Man: Human sciences and studies
 Physical anthropology (in widest sense)
 Social anthropology (in widest sense)
 Social sciences
 Arts

To put some flesh onto this skeleton, an amplification shows some of the additional features necessitated by the practical demands of a working bibliographic classification, including notation. The latter, it should be noted, does not necessarily reflect the relations (of subordination or coordination) between the classes.

This simple linear presentation (which, however, is quite essential to a bibliographic classification) does not fully display the care with which Bliss charted the complexities of the relations involved, and the consistency with which certain principles of subordination have been applied.

The principle of gradation clearly dominates the sequence down to class H, which introduces the human sciences and studies. It is then reflected somewhat differently in the placing of generalizing theoretical studies just ahead of the concrete activities they illuminate. For example, sociology, as the fundamental, generalizing study of society and social institutions, is located ahead of the special social sciences and studies in which particular aspects of human society—its religions, political, and economic structures and its technological and imaginative artifacts—are considered. Bliss firmly rejected the bifurcation of subjects into “abstract” and “concrete” and consistently locates the “abstract” studies (the philosophy and methodology) relating to a given activity with the associated concrete ones. Similarly, Bliss secures a valuable element of predictability by following an old, pragmatic indexing principle that is rarely explicitly stated—that of forming compound subjects, in which both general and special classes are reflected, by citing the special element first, e.g., physical chemistry under chemistry, biochemistry under biology, medical psychology under psychology, educational psychology under education. Generally speaking, such compounding follows a “retroactive” principle, whereby such compounds are located by citing first the “special” activity and then going “backwards” in the sequence to the preceding and more “general” class in order to cite the “general” viewpoint. In the human studies this principle tends to be obscured by the allowances made for consensus, e.g., in allowing the various aspects of a country’s history and description to be collected under that country (in classes M–O) rather than subordinating the place (the society) to the social activity (e.g., legal, political); or, in allowing the economic organization of particular industries to be subordinated to the class economics (T) rather than to place it with that industry in the neighboring useful arts class (U).

By and large, the “modulation” in the BC, whereby each major class leads onto the next in a manner clearly determined by adherence to the basic and consistent theory, as remarkably sustained when we remember the artificiality imposed on a classification by the need to linearize the multidimensional pattern of relations. Only in a few instances does the sequence raise a doubt as to why it is thus, and in these cases it is usually due to Bliss’s anxiety to provide a practical order agreeable to the current “consensus.” For example, education (J) is theoretically a special social science and should not precede sociology (J); Bliss argued that education, as the “training and development of mind and of mental abilities,” is inseparable from psychology and therefore placed it as a

bridge between education and sociology. The practical utility of this is indisputable and would seem to be a major reason for the adoption of the BC by nearly all the university Institutes of Education in the United Kingdom.

Another example of the very practical approach to collocation when the demands of theory are not overwhelming is in his interpretation of philology. Theoretically, language is the fundamental agent of social communication and by gradation should be collocated with sociology, and only its *application* to the “special” human activity of imaginative creation should be subsumed under literature. But there is a strong educational consensus manifested in the study and teaching of the two subjects to justify their collocation, and this Bliss does.

Class Q, social welfare, and so forth (previously called “applied social science”), is a composite class for which no accepted short name is available but which nevertheless collocates reasonably a number of broad social movements and problems (social pathology, women, socialism, internationalism, etc.) in which a number of special social sciences (politics, law, economics, etc.) intermingle.

One more example is the treatment of technology. By gradation, this should be regarded as a special social science (giving the “material culture” of society), and this is by and large how Bliss treats it. However, the demands of the literature obviously suggest collocation of some technologies with the science from which they spring, as in the case of electronics, nuclear engineering, much of chemical technology, and so forth. Bliss acknowledges this, and all these technologies are to be found with physics and chemistry in B and C, representing as they do what Bliss calls “the more scientific technologies.” However, we have noted already that alternatives are provided for some technologies.

Provision for Alternatives

Allowing some technologies to be collocated either with a “pure” science or with the useful arts class is typical of the regard for adjustability which makes the BC by far the most flexible of the major general schemes. This regard takes two forms: first, simple “alternative location,” in which a given class may be located in one of two (or more) different places but without any alteration of its *internal* arrangement; examples here are the moving of theology from Class P (religion) to AJ in order to collocate it with philosophy, or placing constitutional law in law instead of in political science (where Bliss prefers it).

The second feature of this regard for adjustability is in “alternative treatments,” which are more elaborate; they involve altering the internal structure of a class by varying its “citation order,” i.e., the order in which the elements of a compound class are cited (reflecting a different order of application of principles of division). A prominent example here is the rich provision under literature whereby the literature of a given language may be divided first by period

and then by form, or vice-versa; or, the literary texts may be kept separate from the works *about* literature and each major group then divided in various ways, of the division into texts and literary history may be made after prior division by period and/or form. A similar rich provision of alternatives is to be found under social–political history.

Notation

1. This uses predominantly capital letters A–Z; the number 1–9 (but not zero, which would conflict with the letter O) and lower-case letters a–z are used fairly often, as shown below. The comma is used extensively as a facet indicator and the hyphen is used as a phase indicator (i.e., linking elements derived from different subject areas rather than from different facets of the same class). Although Bliss unwisely introduced some ungainly symbols (&, %, and so forth) in the final volume of the BC these were used very rarely and have since been withdrawn (Table 1).

Table 1

1–9	Anterior numeral classes (for special collections of various kinds, e.g., 6, Periodicals) Class 2 here (Bibliology and libraries) is an alternative to its preferred position in Z.
A	Philosophy and general science (including Logic, Mathematics, Metrology, Statistics)
B	Physics (including special physical technology, e.g., Radio)
C	Chemistry (including Mineralogy, Chemical technology)
D	Astronomy, Geology, Geography (General and Physical)
E	Biology (including Paleontology, Biogeography)
F	Botany (including Bacteriology)
G	Zoology (including Zoogeography and Economic Zoology)
H	Anthropology (General and Physical) (including Medicine, Hygiene, Physical training, and recreation)
I	Psychology (including Psychiatry)
J	Education
K	Social sciences Sociology, Ethnology, Anthropogeography (including Travel and description in general)
L–O	Social–political history M Europe, N America, O Australia, Asia, Africa
P	Religion, Theology, Ethics
Q	Applied social sciences and ethics; Social welfare
R	Political science
S	Law
T	Economics
U	Arts in general, Useful arts (including the less scientific technologies)
V	Aesthetic arts, Recreative arts and pastimes
W–Y	Philology: language and literature W Non-Indo–European, X Indo–European, Y English
Z	Bibliology, Bibliography, Libraries

2. Bliss sought simplicity for his notation in two main ways: first, by using for the greater part symbols whose ordinal value are very widely known (i.e., Roman letters and Arabic numerals) with a minimum use of “arbitrary” symbols; second, by maximum brevity. This latter is secured by using a wide base for the radix fraction principle of division (effectively, 35 factors (1–9, A–Z) available for dividing any and every class); by careful allocation of the notation to the classes to reflect the weight of literature to be accommodated (although his assignment of notation to the physical sciences and technologies is somewhat small by this measure); and by the frequent and deliberate abandonment of “expressiveness” (i.e., the quality of conveying hierarchical relations by length of number). An extreme example of the last item would be Bliss’s use of a shorter number for a subclass than for the containing class where the weight of literature justified this (Table 2).

A third way in which Bliss sought easily grasped notation is his likened use of literal mnemonics where these are obtainable without sacrifice of desirable order; e.g., AL, Logic; AM, Mathematics; BD, Dynamics.

3. The hospitality of the notation (its ability to accommodate subdivisions wherever called for) is achieved by the radix fraction principle (cf. the arithmetical notation of the Library of Congress), by the deliberate refusal to seek expressiveness (so that growth is not inhibited by what the class number *looks* like), and by extensive use of the principle of faceted notation (i.e., using distinctive symbols to show the conjunction of different facets, thereby allowing the independent expansion of each facet). This latter is seen in the provision for “composite specification,” or “synthesis,” as it is perhaps better known.
4. Composite specification^[10] is achieved by a number *systematic schedules* (over 50, if the adaptations of particular schedules are counted as separate ones). Like the Auxiliary Tables of the UDC, which perform the same function, they are of two kinds—general (i.e., applicable to any class) and special (i.e., applicable only to a limited number of classes).
5. Of the former, *Schedule 1* provides for *form divisions*, using numerals, e.g., F1 dictionary of botany, F2 bibliography of botany. *Schedule 2* provides for *place divisions*, using lower-case letters, e.g., HOd hospitals in Europe, HOe hospitals in the U.K., HOed hospitals

in London. It should be noted, however, that in some classes (e.g., social–political history L–O) special provision is made for Place and Schedule 2 does not apply. Also, numerals may be used as an alternative to lower-case letters.

Schedule 3 provides for *language divisions*, using capital letters, e.g., XRY, M translations of Portuguese literature into English, XRY,P into Polish. Strictly speaking, this schedule is not general in that it is normally used only in conjunction with areas such as literature and philosophy, but theoretically it may be used to indicate the language of the document in any class. *Schedule 4* provides for *period divisions*, using capital letters, e.g., TU3A taxation in the ancient world, TUJ3N income tax in the nineteenth century. Again, in some classes (e.g., literature) special provision is made for period divisions, and these *Schedule 4* divisions do not apply.

6. Of the special systematic schedules, *Schedule 13* (for subdivision under any disease) is fairly typical. It includes, D diagnosis, ,e Etiology, ,n Therapeutics; these, added to the class number for a disease (e.g., HPSM epilepsy) give, say, HPSM,E etiology of epilepsy; HPSM,N therapy of epilepsy, and so on. In most cases, further detail may be obtained by drawing on the general tables, e.g., HN in therapeutics (general) and HNY is psychotherapy; the terminal “Y” may be added to the “N” from the systemic schedule to give HPSM,NY psychotherapy of epilepsy.
7. Some of the systematic schedules have extensive adaptations for particular needs, e.g., in Class J education one schedule has special adaptations for a number of different types of school. Or, in philology, schedules provide for division by linguistic factors (e.g., ,G grammar), by literary form (e.g., ,Q drama) and for arranging material under any given author; also, adaptations are made to allow fuller detail under the major literary languages.
8. If necessary, elements from several different systematic schedules can be added to a class-number. Confusion as to what schedule a given element comes from is avoided by following Bliss’s advice to introduce capitals from *Schedule 3* by the number “4” (from *Schedule 1*) and capitals from *Schedule 4* by the number “3” (from *Schedule 1*). *Schedule 1* and 2 cannot be confused since they use distinctive symbols (numbers and lower-case letters). This allows the letters from special systematic schedules to be added immediately after the comma (and sometimes even this comma may be dispensed with; e.g., MU social–political history of United Kingdom (U.K.); MUE economic history of U.K.).

Table 2

AZ	Physical science in general
B	Physics

As an example of what a sequence in a catalog or bibliography organized by BC looks like, using these various forms of composite specification, below is a selection

Table 3

UVP	Paper technology

UVP,R,B	Research
UVPA	Rag papers
UVPI	Newsprint paper
UVPI,C	Chemical/Physical studies
UVPI,C,B	Research
UVPQ	Paper boards: Cardboard, etc.

of headings from Class UVP paper technology (for which a special Schedule 21 is available, as it is for all other industries in classes US–UW). This also demonstrates the *filing order* of the different symbols used in the BC notation (which is: 1–9; a–z; –; A–Z) (Table 3).

A–Z Index

Bliss provided an alphabetic relative index to the BC, printed conveniently in a separate volume and comparable in detail to the fullest relative indexes to the Dewey classification, containing about 45,000 subjects. While it is obviously the product of great care and industry, it suffers (as do the alphabetic indexes to the Library of Congress classification) from a failure to appreciate fully the dual role of the A–Z index, which is both a rapid key to the location of classes (using the *names* of subjects as entry) and as a complement to the systematic order in displaying relations between classes (i.e., indicating “distributed relatives”). Consequently, the direct alphabetic approach is constantly undermined by needless classification; for example, under the entry

Railroads, railways TNP : UHL

there are some 80 terms listed, each with its separate number(s), e.g., Accidents UHV; Transportation TNP. Yet all but four of these are subclasses of TNP or UHL (the economic and engineering aspects of railroads, respectively) and would be located very quickly by scanning the *systematic* display of them in the schedules or classified catalog. Moreover, not all of them are repeated under their direct alphabetic form (e.g., soils), so that a searcher for other contexts of these classes (e.g., other contexts of soils) would not find them.

To put the matter in another way, Bliss was unfortunately not aware of the substantial economies and

improved efficiency of access possible here by the use of chain procedure.

Weakness of the BC

The BC was largely the work of one man. Although Bliss received assistance from a number of librarians and subject specialists, the BC was overwhelmingly the product of his own exertions (even physically, in that the schedules are reproduced by photolithography from his own typescript). It is not surprising that there are some flaws of detail in the BC; what is surprising is that there are relatively so few.

The most serious weakness is undoubtedly the same one that marks every other general system apart from Colon, and that is the failure to observe strictly the fundamental rule of classification, which is to apply one principle of division only at a time and to exhaust it before applying another. The modern name for this is, of course, facet analysis, and it is rather sad that Bliss developed his great work just a little too soon to allow it to benefit from the rigorous methods of analysis and synthesis that Ranganathan was developing in his Colon classification. In a number of classes in the BC the facet analysis is clearly imperfect, e.g., in the systematic schedule 21 (applied to paper technology above) may be found (Table 4).

Although this reflects roughly the order in which a technology might operate, it produces an unhelpful mixing of technical and economic problem. The operations facet, for example, begins at ,E with the general technical operation of engineering, changes to a sequence of economic and business operations, is dropped to introduce another facet—that of product—and then returned to at ,R marketing, and so forth. The enumeration of terms such as deterioration, repair (under ,E) means that an implicit facet (processes and operations on agents of production) is being tied to a particular class (here, the agent, plant and machinery) when in fact it might easily occur in the

Table 4

,D	Materials, Raw or Crude Acquisition. . . . Import. . . . Properties. . . . ; Analysis, Testing, etc.
,E	Technology (general), Engineering, and Equipment Plant. . . . Power, Fuels; Machinery. . . . ; Deterioration, Repair
,F–,J	Business: Organization. . . . Management. . . . Personnel. . . . Safety. . . . Insurance. . . . Finances. . . .
,K–,N	Production: Manufacture. . . . Special methods. . . . Patents. . . .
,O–,Q	Products and By-products Properties. . . . Testing. . . . Substitutes. . . .
,R–,S	Markets. . . . Merchandising. . . .

literature compounded with other classes (e.g., deterioration of raw materials). Other classes belonging to this facet (processes and operations on agents of reproduction) are analysis and testing; these are enumerated under ,D and ,O—but not under ,E, say, or ,Q, where they might easily occur.

Lack of thorough facet analysis not only reduces the hospitality of the system but also introduces a lack of predictability for the indexers. Where would marketing personnel go—in ,R marketing or ,G personnel? Where would safety regulations for plant go—in, plant or ,H safety. Also, because of unnecessary repetition (as testing above) the economics in schedule display implicit in composite specification are not fully utilized.

Bliss's failure to appreciate fully the need for stringent facet analysis is also apparent in his discussions of, say, subordination. He tended to see this vital principle primarily as a problem of general-before-special sequence and of collocation between major areas (e.g., the subordination of psychology to anthropology). But every bit as important is the collocation *within* classes (large or small), which is determined largely by the citation order of facets, e.g., whether, in the subject of librarianship itself, college library cataloging is subordinated to the library service (college) or the library operation (cataloging). Consistency, to give predictability in searching, in this matter is very difficult without explicit recognition of facet structure.

However, this weakness in BC is one common to all the major "enumerative" systems, and, what is more significant, is the degree to which Bliss did in fact achieve consistent and thorough analysis. In many classes the demands of composite specification led to just this, e.g., the whole of the large philology class reflects it very clearly indeed.

A weakness of another kind in the BC is the lack of detail in certain class, notably some of the physical technologies. While it is rarely less detailed than the Decimal Classification of the Library of Congress (and the large synthetic element of BC must be remembered here since it greatly enlarges its range of specification), the BC falls well short of the UDC in these areas, despite its extensive provision for synthesis. However, this shortcoming is being remedied by the current program of the *BC Bulletin*.

Present Position

The BC is maintained via the *Bliss Classification Bulletin*.^[6] The first issues were edited by Bliss himself. On Bliss's death, in 1955, British librarians using his scheme cooperated to form the British Committee for the Bliss Classification, and Dr. D.J. Campbell took over the Hon. Editorship of the *Bulletin*, which the H.W. Wilson Company continued to publish and distribute free to all users of the scheme until the stocks of the present edition of the BC

were exhausted. In 1967 the H.W. Wilson Company handed over the publication of the *Bulletin* to the British Committee (which reconstituted itself as the Bliss Classification Association), vesting full copyright of the classification in them.

The BC is now (1968) out of print, although available in xerographic reprint form from University Microfilm, Inc. (313 North First Street, Ann Arbor, Michigan).

Meanwhile, the current program of the annual *BC Bulletin* is to provide, together with simple amendment by addition of recently developed terms, substantial revisions of complete classes, particularly in those areas of science and technology in which the BC has so far lacked detail. In issues of the *Bulletin* detailed schedules have appeared for such classes as electronics, oceanography, automatic control and control devices, nuclear reactor engineering, sound reproduction and recording, astronautics, microchemical analysis, physics and chemistry of the atmosphere, food preservation, operative surgery, child hygiene and care, gardening and fruitgrowing, solid state physics, physical and chemical metallurgy, printing, and so forth.

CONCLUSION

To their reader, most libraries serve primarily as self-service stores of information, in which the *order* of the material is the major index to its content. The efficiency of the day-to-day retrieval is closely affected by the quality of the collocation in that order. The same holds, though to a somewhat lesser degree, with library catalogs and bibliographies. On this score, the BC is without a doubt the best general classification we have. Not merely is its basic pattern superior, but the flexibility to special needs, which is one of its main features, ensures a particularly appropriate order if a local variant is called for. Moreover, the notation which maintains its order is of exceptional brevity and is often highly mnemonic, too. As a system for organizing catalogs and bibliographies, the relative lack of detail in some classes is a drawback, but this is now being remedied.

The main handicap to the wider use of the BC has been, on the one hand, the inertia inevitably associated with existing collections, in which the cost of changing systems is considerable, and, on the other, the administrative advantages enjoyed by the Decimal Classification and the Library of Congress by virtue of their facilities for centralized classification and substantial day-to-day maintenance. These are real disadvantages the BC offers for many kinds of libraries, and it is fitting to end with a categorical assertion by a former editor of the *BC Bulletin*, Dr. D.J. Campbell: "...it is the best scheme for any but very large general libraries, and for many special libraries, while it lends itself to the modifications which every special library needs."^[11]

Bliss Bibliographic Classification Second Edition

Vanda Broughton

School of Library, Archive and Information Studies, University College London, London, U.K.

Abstract

This entry looks at the origins of the *Bliss Bibliographic Classification* 2nd edition and the theory on which it is built. The reasons for the decision to revise the classification are examined, as are the influences on classification theory of the mid-twentieth century. The process of revision and construction of schedules using facet analysis is described. The use of BC2 is considered along with some development work on thesaural and digital formats.

INTRODUCTION

The Bibliographic Classification of Henry Evelyn Bliss (BC1)^[1] was the last of the significant general classifications to appear, and was hailed by many as the best constructed and most scholarly of them all, “the fine flower of the enumerative period.”^[2] Despite that label, it included many facilities and devices for synthetic classification, what Bliss called “composite specification,” or the expression of complex subject content by the building of compound classmarks. Conceptually and structurally BC1 forms a bridge between the great enumerative library classifications of the nineteenth and early twentieth century, the Dewey Decimal Classification and the Library of Congress Classification, and the scientifically structured retrieval tools of the later twentieth century, such as Colon Classification.

BC1 was adopted by many academic and special libraries, particularly in the United Kingdom and the British Commonwealth, although it was not implemented anywhere in the United States, other than Bliss’s own library at the College of the City of New York, where it had originally been developed and tested. When the time came to produce a substantial revision of the classification it was BC1’s British user base which took up the task, and utilized the opportunity to make the 2nd edition a fully faceted classification scheme, the only general scheme of its kind other than Ranganathan’s own Colon Classification. The way in which faceted classification theory is married with the scholarly structure of Bliss’s original scheme is described below under the following heads:

Background and context of the 2nd edition.

The relationship of BC2 to the original Bibliographic Classification.

Facet analysis and information retrieval.

Structural principles of BC2.

The use of BC2 today and developments for the future.

BACKGROUND AND CONTEXT OF THE SECOND EDITION

Bliss was virtually the first theoretician of bibliographic classification, writing in the period immediately before Ranganathan, and establishing very many principles of knowledge organization that are still considered significant today. These include the need to relate documentary classification to the consensus of informed opinion about the nature and structure of subject fields (scientific or educational consensus), and the way in which the whole of knowledge can be reduced to linear order through philosophic or logical method (principles of general-before-special and gradation in specialty). Features of the original classification, its main class order, the presence of systematic and special auxiliaries, the use of systematic and literal mnemonics, the facility for synthesis, the flexibility of its alternative arrangements, and its inherent hospitality to new subjects, are all highly desirable features in a classification and are still so regarded today.

Nevertheless the classification, which was a long time in the gestation period, lacked any mechanism or financial support for the revision and maintenance so clearly required, even by the time of the publication of the final volumes. The first outline of the scheme had been published in 1910 (*Library Journal* 35(8), 351–358), and an abridged version in 1935 (*A System of Bibliographic Classification*; H. W. Wilson: New York). In the years immediately following the publication of BC1, updates and amendments were published in the *Bliss Classification Bulletin*, then under the editorship of H. E. Bliss himself, but after Bliss’s death in 1955 there were no obvious authorities appropriate to the intellectual work of maintenance, and the outlook for the long-term continuation of the system appeared bleak.

British librarians had long been supportive of the BC, and Bliss, in correspondence with a number of them during the period of its creation, acknowledged the part that

they had played in the development of the scheme. BC1 was warmly received in the United Kingdom, and its British advocates did much to promote its uptake both in the United Kingdom and overseas. In 1956 a new British Committee had been elected, and in 1960 Jack Mills became Chair of that Committee and Editor of the *Bliss Classification Bulletin*. In 1967 the Bliss Classification Association (BCA) was formed, again with Jack Mills at the helm, and, as at the time there were no users of BC1 in North America, H. W. Wilson, the publishers of the original scheme, passed all rights in the classification and the *Bulletin* to the BCA, who have remained the copyright holders ever since. The BCA also accepted responsibility for the maintenance of the scheme, and under the guidance of an executive committee, many small-scale revisions and amendments were published during the 1960s, via the medium of the *Bliss Classification Bulletin*.

By the late 1960s it was clear that this piecemeal revision (mainly consisting of the addition of new concepts) was not adequate for the continuation of BC as a viable system, and that more wide-ranging and more radical revision was required. A program was drawn up for such substantial revision, under the editorship of Jack Mills, and based at the School of Librarianship, Polytechnic (later University) of North London, work beginning on the revision in 1967. The revised classification was to be published by Butterworths in Great Britain as the *Bliss Bibliographic Classification 2nd Edition* (BC2), and although the original plan was for a single three-volume work, it was subsequently decided to publish in parts, each consisting of a discrete subject area. The first revised schedules appeared in 1977 (Introduction and Systematic Auxiliaries) and were closely followed by classes for Religion, Social Welfare, Psychology, Education, and Health Sciences. Since the 1970s further volumes have been published for Mathematics, Philosophy, Sociology, Politics, Law, Economics and Business, General Science and Physics, and most recently, the Fine Arts. Social welfare and Education are now in the 3rd edition. Current work is in the areas of Chemistry, Technology, and Music.

RELATIONSHIP OF BC2 TO THE ORIGINAL CLASSIFICATION

Since BC1 was in use in a number of libraries, the extent of the revision was a significant issue. A memorandum was prepared for consideration by the members of the BCA, and published in the *Bulletin* of 1969. Two aspects of the classification were in question: the level of detail in the vocabulary, and the internal structure of classes. It was felt that the vocabulary of BC2 should be at least equivalent to that of the Dewey Decimal Classification and the Library of Congress Classification. Since some specialist libraries used BC1 there was a potential need for a vocabulary comparable to the Universal Decimal Classification,

but this was not considered an achievable objective; there was an expectation that the facilities for synthesis would go some way toward implicit provision for complex topics.

Altering the structure of the classification was a greater problem since the consequences of such changes were more serious. It was agreed that Bliss had intuitively applied much of the new classification theory, and that the scheme largely met the requirements of a modern system. The overall order was excellent, and the internal facet structure was often correct; auxiliary schedules and other devices for synthesis allowed for the expression of complex subjects and the scheme was hence hospitable to new topics. However, it was also the case that in some classes the facet structure was inconsistent and the analysis imperfect. It was decided that, despite the undoubted inconvenience to users, correcting these faults would give the classification greater long-term stability, and reduce the need for frequent revision in the future.

The overall broad structure of the classification (much admired and generally agreed to be the best of any general scheme) would remain intact; new (particularly) scientific subjects, such as space science and cybernetics, were to be added at the appropriate place in the order, and the anterior numeral classes, previously used mainly as form classes, would accommodate a discrete classification of phenomena, allowing for the easier management of cross-disciplinary and interdisciplinary works. Bliss's provision of alternative locations would be built upon and extended, to allow, for example, the location of all technologies in Class U, and a unitary class for geography in Class D. The internal structure of classes was to be made consistent with the methods of faceted classification, which would import a degree of rigor in the analysis which was in parts lacking in BC1, and would ensure uniformity in the application of citation order, filing order, and the procedure for synthesizing classmarks. This process is described in detail below.

FACET ANALYSIS AND INFORMATION RETRIEVAL

Facet analysis was conceived by S. R. Ranganathan during the 1920s and 1930s, and formally disseminated in his works of classification theory,^[3] and the Colon Classification.^[4] While the Colon Classification was virtually never applied in Britain, Ranganathan's ideas profoundly influenced British librarians (The library of Christ's College Cambridge is a notable exception but in 2007 it is now almost completely replaced by the Library of Congress classification.) During the 1950s and 1960s much research and development work was carried out in the area of faceted classification and information retrieval, and many significant works in the field were published. The focus of most of this activity was the Classification

Research Group (CRG), founded in 1952, to which many of the leading lights of the age belonged, and which served as a forum for the discussion of these ideas. The CRG was committed to the concept of faceted classification as a unifying theory for information retrieval and the design of information retrieval tools, and in 1955 published what may be regarded as a manifesto for facet analysis.^[5]

During the 1960s work by the CRG on a new British general classification scheme funded by a grant from NATO^[6] failed to come to fruition, although much of the conceptual work can be discerned in the PRECIS system of indexing developed for the British National Bibliography by the principal researcher, Derek Austin.^[7] Nevertheless, the Group retained its interest in a general classification, and in 1963 held a conference to consider various aspects of this.^[8] Within this context the revision project of BC2 was seen as an ideal opportunity for the incorporation of many of the theoretical principles of the facet-analytical school in a large general classification. As a consequence BC2 became identified to some extent with the new general classification scheme long envisaged by the CRG, and embodying theoretical principles and structure in a way that no universal system of classification (with the exception of Colon Classification) had ever done before. While maintaining and preserving the central features of the original classification, and the general infrastructure of that system—the main class order, broad order within classes, literal notation, and principal mnemonics—the new schedules incorporated all the aspects of modern classificatory theory—rigorous and logical analysis into facets and their constituent arrays, the imposition of a consistent and predictable citation order via the medium of an inverted schedule, a theoretically limitless capacity for synthesizing compound subjects, and the use of a retroactive notation dispensing with the need for facet indicators and greatly simplifying the process of classmark construction.

Since the beginning of the BC2 project CRG meetings have provided a major forum for the discussion of draft schedules of BC2 and debate about the implementation of facet theory in them. Individual members of the CRG have also made a significant contribution to the creation of schedules, notably Eric Coates, Douglas Foskett, and Derek Langridge.

STRUCTURAL PRINCIPLES OF BC2

Main Class Order

In most of its particulars BC2 conforms to the model of a modern general classification scheme on the faceted pattern. The main features of a bibliographic classification scheme in general and those of BC2 in particular are set out in much greater detail in the introduction to BC2,^[9] but a resumé of the core principles is provided here.

It is often said of traditional library classifications, in contrast with automatically generated vocabularies, or with the recent phenomenon of social classification, that they are “top-down” classifications, since they are generated by dividing and subdividing knowledge as a whole. In all existing general schemes the primary step of division is into disciplines, or major subject fields, known as main classes.

The order of the main classes in BC2 follows that of Bliss’s original scheme; this has been widely regarded as the best and most helpful main class order of all the general systems of classification, based as it is on both philosophical principles and educational consensus (that is the perception of interdisciplinary and intersubject relations from the academic viewpoint, and reflecting academic study). The order follows a logical developmental sequence often regarded as consistent with integrative level theory.^[10] This was a scientific theory concerned with the basis of natural order, which was subsequently much used in the social sciences and as part of organization theory; it proposed that entities could be ordered in terms of a series of levels each of which was structurally dependent on the previous level. From a disciplinary point of view, physics, for example, should precede chemistry, since chemical substances were “dependent” on the forces and fundamental particles of physics; similarly chemistry should precede mineralogy and geology where the “simple” substances of the former are aggregated into more complex materials. Such a theory provides an excellent basis for the ordering of disciplines and produces an almost identical result to Bliss’s gradation in specialty order of main classes.

In comparison, BC2 starts with mathematics and the physical sciences, progressing through the biological sciences, with increasing complexity of organisms, to mankind, as represented by anthropology, medicine, and psychology. The study of society, sociology, is collocated with various aspects of human social activity, education, religion, politics, law, commerce and technology, and the whole is rounded off with the higher intellectual activities of man, music, the arts, and literature, culminating in bibliography and library science. In addition to the natural progression of this sequence, the order gives rise to natural academic groupings of subjects, the physical, and biological, sciences, medical sciences, social sciences, commerce and industry, and the arts.

Main Class Order in BC2

A–AL	Philosophy
AM–AX	Mathematics
AY	General science
B/D	Physical sciences
B	Physics
C	Chemistry
D	Astronomy and the earth sciences

(Continued)

Main Class Order in BC2 (Continued)

E/G	Biological sciences
E	General and microbiology
F	Botany
G	Zoology
H/I	Human sciences
HA	Anthropology
HB/HZ	Medicine
I	Psychology and psychiatry
J	Education
K	Sociology
L/O	Historical ancillaries and history
P	Religion
Q	Social welfare
R	Politics and administration
S	Law
T	Economics, business, management
U	Technology, industry, manufacturing
W	Fine arts: art, architecture, music
X/Y	Language and literature
Z	Bibliography

While BC2 shares with the other schemes this initial division into disciplines, subsequent organization of the subject proceeds on a very different basis from the traditional serial subdivision into smaller and more specific classes on more or less pragmatic grounds.

Facet Analysis and Fundamental Categories

A fundamental feature of a faceted classification is that its classes consist of individual concepts, rather like elementary particles in Chemistry, which are combined to express the more complicated subjects of actual documents, as elementary particles are combined to make molecules. Ranganathan himself compared the faceted classification to Meccano, an engineering toy consisting of individual struts, blocks, and wheels which can be combined to create simple machines; its modern equivalent is the Danish building block toy, Lego.

The internal structure of a class is determined by the process of facet analysis, or the allocation of the individual concepts to a set of categories or facets. The conventional definition of a *facet* is the total set of concepts, within a given class, produced by the application of one broad principle of division. Therefore, if a class such as agriculture is divided by the principle of *place*, concepts (or subclasses) such as England, Montana, Bolivia, uplands, forest, coastal regions, etc., are generated. This process can also be viewed as happening in the reverse manner, in that appropriate concepts are aggregated into facets labeled with the principles of division. For that reason, a faceted classification can be regarded as a “bottom-up” classification, that is, one in which individual concepts are grouped or categorized to build the classificatory structure from its component concepts.

Ranganathan identified five *fundamental categories* into which the concepts within a class would be sorted: personality, matter, energy, space, and time. In the Colon Classification these categories often have to do double duty, so that there may be two energy facets, or two (or three) personality facets, in a given subject. Work by the CRG in the 1960s made finer distinctions between categories, so that a set of 13 were eventually agreed on, as can be seen in the work of Vickery,^[11] Foskett,^[12] Langridge,^[13] Mills,^[14] and others. They form the basis of all analysis of concepts in BC2, and are as follows:

Thing: sometimes called **entity**, this is equivalent to Ranganathan’s personality category; it applies to the principal focus or object of interest of any discipline (plants in botany, substances in chemistry, nations in history).

Kind: this accommodates concepts in a genus–species relationship with **thing**, and contains general broad groupings of concepts (e.g., wind instruments, as **kind of thing** musical instruments) as well as specific subclasses (e.g., oboe as **kind of thing** wind instrument).

Part: constituents and subsystems of concepts in the **thing** category (e.g., **thing** vehicle has **parts** chassis, wheels, brakes; **thing** animal has **parts** legs, brain, skin). A separate **part** category only be considered legitimate if its members are in a part–whole relationship to all (or most) members of the **thing** category.

Material: this category is equivalent to Ranganathan’s matter category, and is represented by gross materials, constituents and elements; it is more fundamental than **part** (e.g., a **thing** house, has **parts** roof, walls, windows, basement, consisting of **materials** timber, brick, tiles, glass).

Property: properties and attributes of concepts in the **thing** category.

Process: the first of two energy, or activity categories, **process** refers to inherent and self-initiating actions within **things**—actions that “happen by themselves.” Examples are usually intransitive verbs (or noun equivalents), such as growth, change, disease, and flow.

Operation: these are actions which are performed on a **thing** by an external **agent**. Examples are usually transitive verbs, such as testing, building, mining, and harvesting.

Product: outcomes or results of processes within, or operations on, **things**; they usually occur as actual physical products in technologies; for example, food, drugs, or textiles in agriculture and horticulture.

By-product: another similar, self-explanatory, technological category.

Patient: the object acted on, when this is other than members of the **thing** or **entity** category, as is most usual. Instances are again largely technological; for example, in engineering, blanks (**patient**) may be stamped (**operation**) into components (**part**) for machines (**thing**).

Agent: the means by which **operations** are performed, **agents** may be either persons (or organizations of persons), or tools/equipment. Both categories of agents may occur simultaneously; for example, in medicine a surgeon (**person agent**) may excise tissue using a laser (**tool agent**).

Space: any region defined by political, administrative, physiographic, or other spatial properties (e.g., Hong Kong, Australasia, city, mountains, interior).

Time: any historical period, or concept defined by temporal properties (for example, Medieval, summer, nocturnal, permanent).

These 13 categories have been found to deal adequately with the vocabulary of a wide range of subjects, although it is usually the case that for a particular subject, only a smaller subset of categories is actually required. The complete range is probably only utilized within technological subjects, and modifications to the standard ones are found in some disciplines (notably the arts and humanities). When a particular *category* is identified within a subject, its members constitute a *facet* in that subject for example, the category of *things* or *entities* in zoology is known as the *organisms* facet, and the category of *processes* in pathology is the *disease* facet.

Organization within Facets

In the majority of subjects the number of concepts within a facet will be large, and some further means of organizing them must be found. This is done by identifying groups of concepts that share a particular defining attribute. For example, within sociology concepts in the persons facet may be divided into groups characterized by age (children, adolescents, old people), by gender (male, female), by ethnic origin (Afro-Caribbean, Caucasian, aboriginal), or indeed by a range of other properties. These groupings are called *arrays* and the defining attribute is called a *principle*, or *characteristic*, of *division*.

For example, in Class Q, Social Welfare, the facet "Persons in need" is organized into arrays by several principles of division, as shown in the (abridged) section below.

QG	Persons in need, Causes of need (Types of persons)
	(Defined by events, conditions)
QGN	Emergencies, disasters

QGN G	Victims, refugees
QGN J	Evacuees
QGO B	Prisoners of war (By social conditions)
QGP	Deprivation Poor Unemployed (Persons by age)
QL	Minors, children
QLV	Elderly, aged (Persons by disadvantage)
QMT	Physically disabled Blind

Order in Array

The sequence of the different arrays within a facet, and the sequence of the classes in individual arrays (order within array) are not usually based on any specific principles, although sometimes there are obvious orders to be employed (such as chronological, developmental, or spatial sequences). Ordinarily, order within arrays, and also between arrays, is not subject to any theoretical rules, but is decided pragmatically, as in this list of prisons from BC2 Class Q, which uses the degree of security as the basis of arrangement:

QQS K	Types of prisons
QQS M	Maximum security
N	Medium security
P	Minimum security, open prisons
R	With semiliberty (living in institution, working outside)
S	With restricted liberty (living at home, working at institution)

Order by degree of security in BC2 Class Q

Citation Order and the Combination of Concepts

A second fundamental characteristic of the faceted scheme, after its structural organization, is the system syntax, that is, the rules for combining basic concepts to express the content of documents, which is usually more complex. In any indexing or classification system that allows the building of classmarks or headings, the order in which concepts are combined is known as the citation order. In BC2 this is linked to the standard categories used to create the facets, and is known as standard citation order. A compound subject consisting of terms from more than one category combines them in the order of the standard categories as discussed above, that is, thing-kind-part-material-property-. . .-agent-place-time. For example:

Hospitals—emergency—fittings—procurement—UK
(thing) (kind) (part) (operation) (place)

The order of fundamental categories in the citation order is determined by Ranganathan's principle of decreasing concreteness, and also by the principle of dependency of succeeding facets. This proposes that a thing must exist in order for its kinds and parts to exist, and that an operation must have something to be performed on, and that an agent must have an action to be agent of.

In BC2 the structure does not require that all things are located in a single facet, or all operations, or all agents (a pure faceted structure). In practice the citation order can be introduced at any point. For example, in aeronautical engineering, the wing is part of the aircraft, but can itself have kinds for example, delta, and parts, for example, ailerons; likewise a process may have stages, or parts, for example, digestion has parts ingestion and peristalsis. The structure of BC2 can therefore become quite complex as this example shows:

HUH	Heart	=(Part)
HUH FP	(Treatment)	=(Part + op.)
HUH FV	Drug therapy	=(Part + op. + agent)
	(Disorders)	=(Part + process)
	(Physiology)	=(Part + process)
HUH	(Disorders of	=(Part + pro.1 + pro.2)
OX	heart physiology)	
HUH	Arrhythmia	=(Part + pro. + pro.
OXJ		+ kind)
HUH	(Drug therapy)	=(Part + pro. + pro.
OXJ FV		+ kind + op. + agent)

This example also demonstrates the practice in BC2 of incorporating many compounds into the facet structure to ensure that sought terms will appear in the schedule, and hence in the index.

Filing Order and Schedule Inversion

In addition to the organization of concepts into facets and arrays, and the order of concepts within the facet, it is also necessary to provide rules for the order of facets within the class as a whole. This order is known as the filing order, since it determines the linear sequence of classes on the library shelves or in the classified file.

In BC2 the filing order begins with the most abstract facet (time) and progresses toward the most concrete facet (thing). This concept of increasing concreteness produces an order of classes which looks natural and which appears to be intuitive to users. Because this is the inverse of the citation order, such a classification schedule is known as an inverted schedule.

J	Education	
J7	History of education	(Time)
J8	Education by place	(Place)
JE	Psychology of education	(Process)
JF	Educational performance	(Process)
JG	Students, pupils	(Patients)
JH	Teachers	(Agent)
JI	Teaching methods	(Operation)
JK	Curriculum	
JL/JV	Educands and educational institutions	(Thing/kind)

Inverted schedule in BC2 Class J

The principle of inversion is not essential to a faceted classification, but it makes the filing order much more logical when compound terms are added. We can see this in a very simple classification for history consisting of two facets (place and time) where the citation order is place-time:

History	
England	(Facet 1)
France	
Germany	
Fifteenth century	(Facet 2)
Sixteenth century	
Seventeenth century	

If some compound classes are now added, as will happen when the classification is applied to real documents, and the results filed, the following will occur:

History	
England	
Sixteenth century England	
France	
Fifteenth century France	
Germany	
Seventeenth century Germany	
Fifteenth century	
Sixteenth century	
Seventeenth century	

In this arrangement the specific classes of, for example, sixteenth century England and fifteenth century France, precede the general classes fifteenth century and sixteenth century. This is counterintuitive for the majority of readers who expect general classes to come before subdivisions of those classes, and, as the complexity of subjects is increased the confusion and illogicality of the filing order would also increase.

The situation can easily be remedied by inverting the facet order, so that the first cited facet files last:

History	
Fifteenth century	(Facet 2)
Sixteenth century	
Seventeenth century	

England	(Facet 1)
Sixteenth century	
France	
Fifteenth century	
Germany	
Seventeenth century	

It is not essential to invert the schedule, and in a digital environment where there is no linear ordering it may not offer any advantage, but where items are to be organized in a sequence it makes for a much more logical and natural arrangement. Because in BC2 the citation order is built into the schedule, this has the added advantage of making analysis and classmark building much easier for the classifier, since it is necessary only to combine the elements of a compound in the reverse order of their appearance in the schedule.

Notation

The original literal notation of BC1 has been preserved in the broad structure, since letter notations have several advantages. The notational base is large, and shorter classmarks can be achieved using letters. Because there are 26 letters, a two-character combination provides 26×26 classes (= 676) as opposed to 100 for numerals; at the four-character level, which is most often used for a broad arrangement of books, the difference is 456,976 to 10,000. Obviously a much greater depth of classification can be provided for within the same notational provision. Literal mnemonics, the creation of correspondences between letters in the terminology and letters in the notation, can also be used to advantage, for example, C for chemistry, CE for electrochemistry. As in BC1, the BC2 notation is nonexpressive and neither reflects the degree of hierarchy in the length of the notation, nor indicates the subordination of one class to another.

BTK	B	Bodies in gas flow
BTK	BBG	Control forces
		(parts)
BTK	D	Surfaces
	DR	Holes
		(types of bodies)
BTK	F	Streamlined bodies
	G	1-dimensional bodies
	H	2-dimensional bodies
	J	Manifolds
	L	Conduits, ducts
	N	Channels
	P	Closed conduits

In order to build compound classmarks BC1 uses the comma (to introduce auxiliary schedules peculiar to a subject), and the hyphen (to join classmarks between different classes). In BC2 the notation is used in a more sophisticated way to effect classmark synthesis without

the need for such facet indicators. This device, namely retroactive notation, is, like the citation order, incorporated into the schedule, and it further reinforces the mechanical process of classmark building.

The device operates by “reserving” blocks of notation under each class for the direct addition of any preceding classes. No facet indicators or linking devices are required, since notational conflict is avoided by the appropriate assignment of notation by the schedule compiler. The indexer simply adds together the notational codes for the constituent elements of his concept analysis; since this must be, by definition, done in the reverse of schedule that is, alphabetical order, this also serves to correct any errors in citation order made by the user.

Practical Classification in BC2

Classmark synthesis is achieved in BC2 by two methods. In most cases direct retroactive number building is used, as demonstrated in example 1 below. On occasion, where there is great pressure on the notation (because of the sheer size of the vocabulary), this may be eased by the introduction of an intercalator; this is a “peg” on which to hang synthesized numbers; an example of the use of the intercalator is given at example 2.

1. Normal retroactive building of classmarks within a main class involves the direct addition of notation for a previously scheduled term, dropping the main class letter from the added term.

B	Physics
B7H	Visualization and imaging
BAF	Energy interactions and forces
BF	Waves
BFT	Scattering
BJ	Magnetism
BM	Particles

All classes preceding BM can be directly added to that class, dropping the initial letter B.

BM7 H	Imaging of particles
BMF T	Scattering of particles

2. In some places, intercalators are employed to extend the capacity of the notation. In such cases, notation is added to a specified base letter, rather than directly. For example:

BB	Mechanics
BBB T	Kinetic energy
BDC	Velocity
BDM	Circular motion

BF	Waves, wave motion *Add to BFA letters A/DR following B
BFA BBT	Kinetic energy of waves
BFA DC	Velocity of waves
BFA DM	Circular motion of waves

Here previous classes are added to the intercalator A, rather than directly to the class BF. Use of the intercalator is always made explicit by instructions in the schedule, and should not be used other than in compliance with these.

THE USE OF BC2 TODAY AND DEVELOPMENTS FOR THE FUTURE

Although the scheme is envisaged as a general scheme suitable for large document collections, the take-up of BC2 has been largely among special libraries. The new scheme offers a level of detail in its terminology, and a capacity for synthesis that is particularly appropriate for collections of highly specialized documents, and in some disciplines there are no comparable indexing languages, either general or special. This is particularly true for Social welfare and related subjects where adoption of BC2 has been most widespread. Of recent times it has also been applied in a number of medium sized academic libraries in the University of Cambridge.^[15] It finds favor in these because of its sound theoretical principles, the visible logic and predictability of its structure, and the close match between its broad structure and the academic understanding of the constitution of subjects.

Most users of BC2 are new to the scheme, and BC1 libraries have not on the whole reclassified to the new edition, probably because the modification of the internal structure and the changes in notation would require both substantial reprocessing of stock and amendment of catalog records. The complexity of BC2 may also be seen as a disadvantage in an age when most UK librarians receive little formal education in cataloging. Over a period of time most BC1 libraries have now reclassified (or are in the process of reclassifying) to either the Library of Congress Classification or the Dewey Decimal Classification. The current emphasis on copy cataloging and the downloading of records in preference to local cataloging effects considerable savings for the majority of general libraries, making it difficult for schemes with a smaller user base to compete. Attempts in the 1970s to persuade the British National Bibliography to include BC2 classmarks were unsuccessful, and it is unlikely that this situation will change in the future.

BC2 also suffers from many of the same disadvantages as the original classification, and has been criticized on that basis. The lack of strong institutional and financial support for the scheme is a major shortcoming, and the

dependence on voluntary input from BC2 enthusiasts makes consistent and systematic maintenance and updating hard to achieve. The lack of salaried staff means that schedule production is a slow process, and this has been exacerbated by the need to reengineer the software that manages the physical generation of the schedules and alphabetical index.

To date, about two-thirds of the classification is published, and the remaining classes exist in draft format. Current plans are to disseminate these drafts on the Association's Website (<http://www.blissclassification.org.uk>) in the hope of providing for the gaps in the available classes, and attracting input from a wider constituency. It is also intended to produce in the near future an abridged version of the scheme (based in part on the unpublished classes) which may have greater appeal, particularly for small libraries, than the full classification, and will also address the problem of the missing subjects. Although completion of the scheme may as yet be some way off, where the necessary expertise is available, some classes (J, Education and Q, Social Welfare) have already been published in a 3rd edition.

BC2 in its inception was intended, like its predecessor, primarily as a bibliographic classification, and an organizing tool for print collections. Nevertheless the physical arrangement of books (and the related ordering of items in catalogs and bibliographies), important as this is, is not the only potential application of the system.

BC2 in a Digital World

There are numerous examples of applications of classifications and other conventional indexing languages to the organization of Web-based resources, and a number of schemes are used to arrange resources on managed sites, in the same way that those same schemes are used to order books on shelves. *EU telematics for research project DESIRE* surveyed the use of a number of existing library classifications for the management of Internet resources, particularly in managed hubs and portals. The results of their investigations can be viewed at <http://www.surfnet.nl/innovatie/desire1/deliver/WP3/D32-3.html>. However, more recent projects have begun to look at the knowledge structures embedded in classifications as tools for handling structural and semantic relations in searching and retrieval. It would appear that the highly structured, rigorously logical and predictable BC2, with its detailed vocabulary, and sophisticated semantic and syntactic relations, should be a frontline contender in any such enterprise. A project funded by the U.K. Arts & Humanities Research Council at University College London looked at the way faceted classification data can be structured and manipulated to deliver some degree of automatic indexing for digital resources.^[16] BC2 vocabularies provided the core subject terminologies, and the results were very encouraging. The regular structure of the classification lends itself

readily to incorporation in a database, where many of the relationships, including the facet status of a concept, can be recorded. This can allow the mapping of a document content analysis or a search query onto the database, and the automatic generation of structured strings using controlled vocabulary and with inbuilt citation order. It did, however, demonstrate that some features of the scheme (such as the alternative locations, the flexibility of the citation order, and the lack of facet indicators) must be sacrificed in order to achieve the regularity of structure that machine manipulation demands.^[17]

Thesaurus Format for BC2

As long ago as the 1980s the potential of BC2's faceted terminology as a source for a thesaurus had been realized and exploited. Jean Aitchison, known for her pioneering work on *Thesaurofacet*,^[18] had written about the process of converting BC2 to a thesaurus,^[19] and had developed a faceted thesaurus for international affairs from the BC2 Politics terminology.^[20] Current work on the classification is investigating the feasibility of publishing future volumes in the form of a joint classification and thesaurus, rather on the model of the *Thesaurofacet*. Music is a suitably straightforward vocabulary, of relatively modest size, and has been chosen as a trial class. To date the computer programs for the classification layout and alphabetical index generation have been extended to support the thesaurus format, and work has proceeded on guidelines for the form of entry of class headings to ensure that these can be converted to thesaurus entries with the minimum of human intervention and editing.^[21] Some difficulties occur as a result of the lack of vocabulary control in the classified structure, but otherwise trials of the software show that structural relationships are relatively straightforward to manage automatically, and that BC2 provides a sound basis for automatic thesaurus generation.^[22]

Influence of BC2 on Other Schemes

It is also clear that the major contribution of BC2 to date lies not so much in its adoption by individual institutions, as in the influence it has had on the development of classificatory theory, and the consequent impact of this on the other major schemes. Particularly this is true of the UDC. McIlwaine, I. and Williamson, N. *A feasibility study on the restructuring of the UDC into a full faceted classification system* International Society for Knowledge Organization Conference 1994 Copenhagen, examines the use of BC2 as a source of facet analytical structure and vocabulary for incorporation into new revisions of the UDC. This theme is further developed in McIlwaine, I. UDC centenary; the present state and future prospects. *Knowledge organization* **1995** 22(2), 64–69. Most other systems now regard some degree of facet structure as necessary in the development of new schedules, and the advantages in

retrieval performance of highly structured and logical systems on the model of BC2 can hardly be disregarded. The gradual spread of the faceted structure throughout an increasing number of retrieval languages must be due at least in some measure to the perceived superiority of this approach, and it seems likely that the published schedules of BC2 have provided a pattern for modern retrieval language construction that is now widely regarded as the archetype of the twenty-first century scheme.

Boolean Algebras [ELIS Classic]

A. R. Bednarek

University of Florida, Gainesville, Florida, U.S.A.

Abstract

Boolean algebra, named after the 19th century mathematician and logician, George Boole, has contributed to many aspects of computer science and information science. In information science, Boolean logic forms the basis of most end-user search systems, from searches in online databases and catalogs, to uses of search engines in information seeking on the World Wide Web.

—ELIS Classic, from 1970

INTRODUCTION

In this entry attention is focused on mathematical models of proven utility in the area of information handling, namely, Boolean algebras. Following some general comments concerning mathematical models, particular examples of Boolean algebras, serving as motivation for the subsequent axiomatization, are presented. Some elementary theorems are cited, particularly the very important representation theorem that justifies, in some sense, the focusing of attention on a particular Boolean algebra, namely, the algebra of classes, and applications more directly related to the information sciences are given.

Running the risk of redundancy, attention will be called to an often-repeated observation, but one of extreme importance in applications of mathematics to physical problems. Referring to Fig. 1, it is important to realize that when one constructs a mathematical model as a representation of a physical phenomenon, one is abstracting and, as a consequence, the model formulated is doomed to imperfection. That is, one can never formally mirror the physical phenomenon, and must always be satisfied with an imperfect copy. However, following the initial commitment to a model, the logic that one appeals to dictates the resultant theorems derived within the framework of the model. Of course, the depth of the theorems realized is limited by the sophistication of the model as well as the ingenuity of those who attempt to formulate the propositions within it. After theorems are derived within the framework of the model, they are interpreted relative to the physical situation that motivated the model.

It is not necessary to go very deeply into mathematics before facing the necessity of examining, in some detail, this cycle and developing a feeling for its power as well as its limitations. By way of example, almost any student of calculus encounters, in one form or another, the following problem:

The deceleration of a ship in still water is proportional to its velocity. If the velocity is v_0 feet per second at the time

the power is shut off, show that the distance S the ship travels in the next t seconds is $S = (v_0/k)[1 - e^{-kt}]$ where k is the constant of proportionality.

HISTORY

The desired equation relating the distance traveled to the time is easily arrived at by means of the calculus. However, a close look at the solution reveals a few puzzling aspects. When does the ship stop? The conclusion is that it never stops. How far does it go? The conclusion is that it goes no further than v_0/k , that is, the distance it travels is bounded. Sympathy is due the beginning student of the calculus who is puzzled by these observations, but, too often, we neglect to focus our attention on the source of the puzzlement. It really has nothing to do with the limit process that plays such an integral role in analysis, nor must we drag poor Zeno into the picture. This disturbing conclusion is not the consequence of any faulty mathematics, but is more directly related to the naïveté of the original model. If we say that the deceleration of a ship in still water (an idealization in itself) is proportional only to its velocity, then the conclusion that asserts itself is that the ship never stops but only goes a finite distance.

The usual remedy applied in such cases as the ship problem is to construct a more sophisticated model, that is, a model that takes into account more of the phenomena observed. For example, in the ship problem, the assertion that the deceleration is proportional only to the velocity might be amended to include friction in some way, resulting in an equation of greater complexity, the formulation and solution of which require a more general mathematical model. We might extend the preceding model to look like Fig. 2.

The great power of mathematics lies in its ability to reflect several different phenomena at one time, and the theorems derived within the framework of a single

Fig. 1

axiomatization of these varied phenomena will, in turn, be applicable to each of them. However, the trade-off that exists between generalization and depth must constantly be kept in mind. That is, it should be remembered that it is difficult to prove deep theorems in very general models. But when axioms are added to the model, the phenomena which the model reflects begin to be delimited, and certainly one does not wish to undermine the real power of mathematics, that is, its ability to treat a variety of situations at the same time.

Examples

We now turn our attention to an examination of some of the particular examples of the model that is the principal concern of this entry, Boolean algebras. One must keep in mind that the common characteristics of these models are precisely those that will constitute the elements of our later axiomatization. To avoid infinite regress a certain level of sophistication on the part of the reader, if not actual mathematical experience, is assumed.

Example 1 (A finite algebra)

The system considered in this example consists of the two digits, 0 and 1, and two binary operations of multiplication, “ $\cdot$,” and addition, “ $+$.” The operations are defined by the multiplication and addition tables shown.

$\cdot$	0	1
0	0	0
1	0	1

Multiplication

$+$	0	1
0	0	1
1	1	1

Addition

If x , y , and z are any *variables* that are allowed to assume one of the two values 0 or 1, then the structure defined above has an algebra possessing (among others) the following properties:

$$x \cdot x = x \quad x + x = x \quad (1a)$$

$$x \cdot y = y \cdot x \quad x + y = y + x \quad (1b)$$

Fig. 2

$$x \cdot (y \cdot z) = (x \cdot y) \cdot z \quad x + (y + z) = (x + y) + z \quad (1c)$$

$$(x \cdot y) + x = x \quad (x + y) \cdot x = x \quad (1d)$$

$$x \cdot (y + z) = (x \cdot y) + (x \cdot z) \quad x + (y \cdot z) = (x + y) \cdot (y + z) \quad (1e)$$

Each of the above can be verified by a consideration of all the possible values of the variables.

If B is the collection consisting of the elements 0 and 1, and for each x in B x' is defined by $x' = 1$ if $x = 0$, and $x' = 0$ if $x = 1$, then

$$\begin{array}{lll} x \cdot x' = 0 & \text{and} & x + x' = 1 \\ 0 \cdot x = 0 & 1 \cdot x = x & \text{and} \quad 0 + x = x \quad 1 + x = x \end{array} \quad (1f)$$

We let $[B; \cdot, +, ']$ denote the system described in Example 1.

Example 2 (Algebra of propositions)

The elements in this example are *propositions*, that is, statements to which it is possible to assign one of the truth values “true” or “false.” Two propositions p and q are defined to be equal if and only if they have the *same* truth value. We consider the two logical binary operations of *conjunction* and *disjunction* as well as the unary (operating on a single proposition as contrasted with a binary operation, which operates on pairs of propositions) operation of *negation*. The conjunction of the propositions p and q is denoted by pq and is the proposition corresponding to that obtained by applying the logical connective “and.” The conjunction is defined to be true only if both p and q are true. Otherwise it is false. The disjunction of p and q , denoted by $p + q$, is the proposition corresponding to that obtained by applying the logical connective “or.” The proposition $p + q$ is false if and only if both p and q are false. The negation of p , denoted by $\bar{p}$, is the proposition having truth values opposite those of p . It corresponds to the logical statement, “It is false that p .”

All of the above can be summarized nicely by employing “truth tables” that give the truth values of compound statements, realized by applying the operations discussed to the truth values of the component propositions.

p	q	pq
T	T	T
T	F	F
F	T	F
F	F	F

Conjunction

p	q	$p + q$
T	T	T
T	F	T
F	T	T
F	F	F

Disjunction

p	$\bar{q}$
T	F
F	T

Negation

One can verify that, in view of the definitions above, if p , q , and r are any propositions, the following statements hold.

$$pp = p \quad p + p = p \quad (2a)$$

$$pq = qp \quad p + q = q + p \quad (2b)$$

$$p(qr) = (pq)r \quad p + (q + r) = (p + q) + r \quad (2c)$$

$$(pq) + p = p \quad (p + q)p = p \quad (2d)$$

$$p(q+r) = pq + pr \quad p+(qr) = (p+q)(q+r) \quad (2e)$$

$$p\bar{p} \text{ is always false and } p + \bar{p} \text{ is always true} \quad (2f)$$

Denoting $p\bar{p}$ by 0 and $p + \bar{p}$ by 1 we have

$$0q = 0 \quad 1q = q \quad 0 + q = q \quad 1 + q = q$$

(Note: It is easy to see that $p\bar{p} = q\bar{q}$ and $p+\bar{p} = q+\bar{q}$ for any propositions p and q .)

We illustrate the employment of the truth table technique in the verification of part of the assertion in Eqs. 2e, namely, that $p + (qr) = (p + q)(p + r)$.

p	q	r	qr	$p + qr$	$p + q$	$p + r$	$(p + q)(p + r)$
T	T	T	T	T	T	T	T
T	T	F	F	T	T	T	T
T	F	T	F	T	T	T	T
T	F	F	F	T	T	T	T
F	T	T	T	T	T	T	T
F	T	F	F	F	T	F	F
F	F	T	F	F	F	T	F
F	F	F	F	F	F	F	F

Since the columns headed “ $p + qr$ ” and “ $(p + q)(p + r)$ ” have identical entries the propositions $p + qr$ and $(p + q)(p + r)$ have the same truth value and are therefore equal.

The structure described in Example 2 is denoted in the sequel by $[\mathcal{O}; +, -]$.

Example 3 (Algebra of sets)

The term *set* is taken as undefined and used synonymously with class, aggregate, and collection. The objects that constitute a set E are called the *elements* of E . To denote the logical relation of “being an element of E ” we use the notation $x \in E$. This is read: “ x is an element of E .” The denial of this relation is symbolized by $x \notin E$.

The notation of $E = \{xP(x)\}$ denotes the set E consisting of all x for which the proposition $P(x)$ is true. When the set under consideration is finite, it is often denoted by a simple listing of its elements; thus, $E = \{a, b\}$ is the set consisting of the elements a and b .

If $A = \{xP(x)\}$ and there are no elements which satisfy the proposition $P(x)$, A is said to be the *empty set*. The empty (or *null*) set is denoted by ϕ .

If the sets E and F have the property that every element of E is an element of F , E is called a *subset* of F ; this is denoted by $E \subset F$. If the set E is a subset of F , but F is not a subset of E , then E is said to be a *proper subset* of F , or F *properly contains* E . The empty set ϕ is a subset of every set.

Two sets E and F are *equal*, written $E = F$, if and only if $E \subset F$ and $F \subset E$.

Given two sets E and F , we define the *union*, denoted by $E \cup F$, by the set equation

$$E \cup F = \{x | x \in E \text{ or } x \in F\}$$

Similarly, the *intersection* of E and F , denoted by $E \cap F$, is defined by

$$E \cap F = \{x | x \in E \text{ and } x \in F\}$$

In general, consideration centers on subsets of a fixed set often referred to as the *universal set*. In particular, if X is the universal set, we let $\mathcal{P}(X)$ denote the set of all subsets of X . The set $\mathcal{P}(X)$ is often called the *power set* of X . If $E \in \mathcal{P}(X)$, then the *complement* of E , denoted by E' , is defined as $E' = \{x \mid x \in X \text{ and } x \notin E\}$. If E and F are elements of $\mathcal{P}(X)$, that is, subsets of X , then the *difference* of the sets E and F , denoted by $E - F$, is the set defined by

$$E - F = \{x|x \in E \text{ and } x \notin F\}$$

It should be noted that $E - F = E \cap F'$.

It is often helpful to employ the schematics shown in Fig. 3 in visualizing the set-theoretic relations and operations defined above. The rectangular area represents the

Fig. 3

universal set X ; subsets of X are denoted by areas within the rectangle.

Focusing our attention on a particular universal set X and its power set $\mathcal{P}(X)$, it is easy to verify the following properties (in no sense exhaustive) of the algebra of sets, where E, F , and G are arbitrary subsets of X .

$$E \cap E = E \quad E \cup E = E \quad (3a)$$

$$E \cap F = F \cap E \quad E \cup F = F \cup E \quad (3b)$$

$$E \cap (F \cap G) = (E \cap F) \cap G \quad E \cup (F \cup G) = (E \cup F) \cup G \quad (3c)$$

$$(E \cap F) \cup E = E \quad (E \cup F) \cap E = E \quad (3d)$$

$$E \cap (F \cup G) = (E \cap F) \cup (E \cap G) \\ E \cup (F \cap G) = (E \cup F) \cap (E \cup G) \quad (3e)$$

$$E \cap E' = \phi \quad E \cup E' = X \\ \phi \cap E = \phi \quad X \cap E = E \quad \phi \cup E = E \quad X \cup E = E \quad (3f)$$

In the sequel we denote the above algebra of sets by $[\mathcal{P}(X); \cap, \cup, ']$.

Axiomatization

In the preceding section we examined three structures possessing some common properties, namely, (1i), (2i), and (3i), where $i = 1, 2, 3, 4, 5, 6$. We abstract to construct the important mathematical (see Fig. 1) model called a *Boolean algebra*, named in honor of G. Boole who first studied it in 1847.^[1,2]

A *Boolean algebra* is a set B with two binary operations $\wedge$ (cap) and $\vee$ (cup) and a unary operation (complementation) satisfying the following axioms:

$$x \wedge x = x \quad \text{and} \quad x \vee x = x \quad (Ia)$$

$$x \wedge y = y \wedge x \quad \text{and} \quad x \vee y = y \vee x \quad (Ib)$$

$$x \wedge (y \wedge z) = (x \wedge y) \wedge z \quad \text{and} \quad x \vee (y \vee z) = (x \vee y) \vee z \quad (Ic)$$

$$(x \wedge y) \vee x = x \quad \text{and} \quad (x \vee y) \wedge x = x \quad (Id)$$

$$x \wedge (y \vee z) = (x \wedge y) \vee (x \wedge z) \quad \text{and} \\ x \vee (y \wedge z) = (x \vee y) \wedge (x \vee z) \quad (Ie)$$

B contains *distinct* elements 0 and 1 such that

$$x \wedge x' = 0 \quad \text{and} \quad x \vee x' = 1 \\ 0 \wedge x = 0 \quad 1 \wedge x = x \quad \text{and} \quad 0 \vee x = x \quad 1 \vee x = 1 \quad (If)$$

This is by no means the only axiomatization possible,^[3] but it is probably the one most commonly used.

To emphasize the relationship between the above axiomatization and the preceding particularizations

Boolean algebra	Example 1	Example 2	Example 3
B	set $\{0,1\}$	set $\mathcal{P}$ of all propositions	set $\mathcal{P}(X)$ of all subsets of a fixed set X
$\wedge$	$\cdot$	conjunction	intersection
$\vee$	$+$	disjunction	union
$'$	$'$	negation	complementation
0	0	$p\bar{p}$	empty set ϕ
1	1	$p + \bar{p}$	universal set X

(Examples 1, 2, and 3) we identify in tabular form the corresponding structural elements.

We now prove a particular theorem to illustrate the generation of results within the framework of the model and their subsequent application.

Theorem. If $(B; \wedge, \vee, ')$ is a Boolean algebra, then for any x and y in B we have

$$(i) x'' = x$$

$$(ii) (x \wedge y)' = x' \vee y'$$

Proof. First of all we prove that every element has only one complement. Suppose $\bar{x}$ is an element such that $x \wedge \bar{x} = 0$ and $x \vee \bar{x} = 1$. Then

$$\bar{x} = \bar{x} \wedge 1 = \bar{x} \wedge (x \vee x') = (\bar{x} \wedge x) \vee (\bar{x} \wedge x') \\ = 0 \vee (\bar{x} \wedge x') = \bar{x} \wedge x'$$

but

$$x' = x' \wedge 1 = x' \wedge (x \vee \bar{x}) = (x' \wedge x) \vee (x' \wedge \bar{x}) \\ = 0 \vee (x' \wedge \bar{x}) = (x' \wedge \bar{x})$$

and since $\bar{x} \wedge x' = x' \wedge \bar{x}$, we have $\bar{x} \wedge x'$. We then apply the preceding by demonstrating that $(x \wedge y) \wedge (x' \vee y') = 0$ and $(x \wedge y) \vee (x' \vee y') = 1$, so that $(x \wedge y)' = x' \vee y'$.

$$\begin{aligned} (x \wedge y) \wedge (x' \vee y') &= [(x \wedge y) \wedge x'] \vee [(x \wedge y) \wedge y'] \\ &= [(y \wedge x) \wedge x'] \vee [(x \wedge y) \wedge y'] \\ &= [y \wedge (x \wedge x')] \vee [x \wedge (y \wedge y')] \\ &= [y \wedge 0] \vee [x \wedge 0] = 0 \vee 0 = 0 \end{aligned}$$

$$\begin{aligned} (x \wedge y) \vee (x' \vee y') &= [(x \wedge y) \vee x'] \vee y' \\ &= [(x \vee x') \wedge (y \vee x')] \vee y' = [1 \wedge (y \vee x')] \vee y' \\ &= (y \vee x') \vee y' = (x' \vee y) \vee y' \\ &= x' \vee (y \vee y') = x' \vee 1 = 1 \end{aligned}$$

An interpretation (application) of this theorem in Example 2 yields the fact that the negation of the conjunction of two propositions is the disjunction of the negations of each of them. For example, "it is false that x is a positive integer and x is greater than or equal to 5" is logically equivalent to the proposition " x is not a positive integer or x is less than 5."

An interpretation of the above in Example 2 yields the set-theoretic equation

$$(E \cap F)' = E' \cup F'$$

that is, the complement of the intersection of two sets is equal to the union of their complements, as shown in Fig. 4.

We describe very briefly some of the more significant results and developments in the theory of Boolean algebras. For a comprehensive treatment of the subject, see Birkhoff^[3] and Halmos^[4] and their bibliographies.

Every Boolean algebra can be made into a ring with identity in which every element is multiplicatively idempotent; that is, $x^2 = x$ for every x . This is accomplished by defining addition and multiplication as follows

Fig. 4

$$x + y = (x \wedge y') \vee (x' \wedge y) \text{ and } xy = x \wedge y$$

Because rings are more familiar and more carefully studied many of the useful concepts can be translated into the context of Boolean algebras.

Conversely, if one starts with a ring with identity in which every element is idempotent (usually called a Boolean ring), defining $\wedge$ and $\vee$ by

$$x \wedge y = xy \quad x \vee y = x + y + xy$$

the Boolean ring is converted into a Boolean algebra.

Two Boolean algebras, B_1 and B_2 , are said to be *isomorphic* if there exists a function $h: B_1 \rightarrow B_2$ that maps B_1 onto B_2 in such a way that distinct elements of B_1 are mapped onto distinct elements of B_2 , and h preserves the operations; that is, $h(x \wedge y) = h(x) \wedge h(y)$; $h(x \vee y) = h(x) \vee h(y)$; and $h(x') = h(x)'$.

If X is a compact Hausdorff space, then the class of sets that are both open and closed forms a Boolean algebra. A topological space is totally disconnected if the only components (maximal connected sets) are points. There is a very important *representation theorem* in the theory of Boolean algebras, the Stone Representation Theorem (M.H. Stone^[5]). If B is a Boolean algebra, then a compact totally disconnected Hausdorff space S exists such that B is isomorphic to the Boolean algebra of all open-closed subsets of S .

An Application

We consider here one modest application of the preceding to switching theory. Switching theory is concerned with circuits composed of elements that can assume a finite number of discrete states, most commonly two states. These circuits are modeled as described earlier, and the models are analyzed. This is an idealization; the models neglect such characteristics as stability, temperature effects, and transition times. The theory of Boolean algebras has played an important role in the analysis of these models for circuits made of binary (two-state) devices.

A *switching function* is a rule by which the output of a composite circuit can be ascertained from the states of its components. If the variables x , y , and z denote switches and each switch can assume one of the states, open or closed (0 or 1), then the function $w = x \wedge y$ describes the output of a series circuit containing the switches x and y . Similarly, $t = x \vee y$ is a function describing a parallel circuit

Fig. 5

Fig. 6

containing the switches x and y . These components, along with the negation function (x' is a switch that is open whenever x is closed and closed whenever x is open), allow the construction and analysis of complex circuits. This analysis can be carried out by the use of truth tables, and the circuits can be indicated by a diagram, as shown in Fig. 5.

With this interpretation it is readily seen that the above is a Boolean algebra. For example, the verification of axiom (Id) involves the observation that the circuits in Fig. 6 are equivalent.

After observing that it is indeed a Boolean algebra, the machinery of that algebra may be used to synthesize circuits, consider questions of realizability, minimize circuitry, and so forth. We can only hint at the possible applications.^[6]

Brazil: Library Science

Mariza Russo

Faculty of Administration and Accounting Sciences (FACC), Federal University of Rio de Janeiro, Rio de Janeiro, Brazil

Abstract

This entry presents the history of Library Science in Brazil, from the creation of the first Library Science course in 1911, in the National Library, Rio de Janeiro, to the current courses offered today. The various levels of education for the professional librarian are described as well as the evolution of the profession from the early recognition of it as such through the twenty-first century including both undergraduate and graduate courses. It also focuses on the paradigmatic changes in information demands and discusses the professional job market highlighting the opportunities open to potential entrants.

INTRODUCTION

For many years in Brazil, Library Science as an avocation, had as its place in the library, which was mainly viewed from a static perspective as “a warehouse.” It was more for storing a collection rather than for exploiting it, and the more extensive it was, the more valuable it was perceived to be. For the profession to grow and broaden its functions, a radical change in its outlook was required. The result was a new trend toward an interest in facilitating access to the collections—which resulted in a growth in research and, in turn, a growth in knowledge.

The practice of the profession, at this time, was to find studious individuals, lovers of books and belles lettres, or historians—almost always highly cultured individuals—who would work with two main objectives: “to guard the collection zealously” and “to preserve it for the future.”

With the advent of the Industrial Revolution several events stand out that had world-wide influence for the practice of Library Science: increased production of the printed book; new scientific discoveries; the proliferation of scientific societies and the accompanying growth of scientific periodicals. These events brought about substantial changes leading to the information age and the changing role of the book keepers. Library professionals had to take on the responsibilities of acquiring, conserving, organizing, and distributing information and acquire the skills to do all of these.

DEVELOPMENT OF LIBRARY SCIENCE

There are several indispensable indicators for an area of study to be considered scientific: that it has developed theories, accompanied with practices that prove those theories; that there is a scientific infrastructure based on scientific societies, channels of communication, educational institutions and research; and most importantly, on qualified staff.

The formation of such staff represents a major component for the development of any field of study. For Library Science, it is achieved through courses at the undergraduate level in Latin American countries, and at the postgraduate level in Europe and in the United States.^[1]

In Brazil, courses of Library Science are offered mainly as undergraduate courses and postgraduate specializations, resulting in students having the legal right to the title “librarian” upon graduation. Graduate courses for master’s and doctorate degrees are completed in programs of various fields of study, with a major in Information Science.

The undergraduate and specialization courses result in the basic training needed to practice the profession. To become a professor or researcher, completion of a master’s or doctorate program is required and sometimes both.

Undergraduate Courses

In Brazil, the evolution of the professional course of Library Science is characterized by three distinct phases.^[2] The first one, from 1879 through 1929, followed the French traditions under the aegis of the National Library of Rio de Janeiro. The second, from 1929 through 1962, was based on American models, with the Mackenzie College, in São Paulo leading the way. The third, from 1962 until the present, begins with the establishment of the first official minimum curricula requirements (1962, revised in 1982) approved by the Federal Council of Education, and by the directives for curricula decreed in the Law of Directives and Educational Foundation (1996).

First phase

Library Science in Brazil, as a profession, closely follows the creation to the National Library. This library was formerly the Royal Library of Portugal, brought to Brazil by the Portuguese Crown, as it took refuge from the

invading French army in its more prosperous colony in 1808. Officially established in 1810, it was opened to the public in 1814. Headed by clerics in the early days, its first secular director was appointed in 1846. Subsequently, the directors began to voice their concern for the lack of qualified staff and, with the objective to ameliorate these circumstances, the first course of Library Science was created in 1911 within the National Library. The first group of students in 1915 studied four disciplines: Bibliography (subdivided into Administration of Libraries and Cataloging); Paleography and Diplomatics; Iconography and Numismatics. This course was later revised following the model of the *École Nationale de Chartes*, in Paris—the first school in the world (1821) for the formation of library professionals. In this phase, the predominance of general culture reigned to the detriment of Library Science practices.

Second phase

The second phase began with the pragmatic model of education for Library Science and the Elementary Course of Library Science, created in the late 1920s at the Mackenzie College of São Paulo. This school was soon followed by another, the Course of Library Science of the Department of Culture of the City of São Paulo, in 1936 directed by the city's Municipal Librarian Rubens Borba de Moraes. Both schools adopted the American model for the courses of Library Science, favoring its technical emphasis over the study of general humanities.

These two courses brought significant changes to the library scene limiting the term “Modern Libraries,” to those whose bookshelves and catalogs were open to the public with free access, in ample and comfortable installations, accommodation, with good illumination, and trained librarians to assist the readers.

In 1944, a new reform occurred in the National Library (see Fig. 1), incorporating changes in the Course of

Library Science, that de-emphasized the humanist and scholarly aspects and emphasized American technical practices. This change was brought about by Brazilian librarians who had studied for specializations in the United States. This reform and the creation of the Course of the Free School of Sociological Politics of São Paulo, with funding from the Rockefeller Foundation in 1940, opened up new opportunities for the field. Professionals from other Brazilian states that participated in these courses in Rio de Janeiro and São Paulo, upon returning to their homes, reorganized old libraries, created new ones and started new Library Science courses in their respective home states. For example, the Schools of Library Science of Bahia, of Belo Horizonte and Paraná, among others were founded soon afterwards.

Third phase

The proliferation of Library Science courses in the country—each one with a different grading system—started to cause concern among library professionals. This gave rise to a national movement with the goal to standardize education to improve the performance of the average Brazilian librarian. The first “Minimum Curriculum” for the course of Library Science was established by the Federal Council of Education (CFE), by means of a Resolution of November 16, 1962. Decree no. 326/62, authored by Council member, Josue Montello, presented the following basic characteristics:

1. *Course offerings:* History of the Book and Libraries; History of Literature; History of Art; Introduction to Historical and Social Studies; Evolution of Philosophical and Scientific Thought; Organization and Administration of Libraries: Cataloging and Classification; Bibliography and Reference; Documentation; Paleography.
2. The duration of the course changed from two to three academic years.

Fig. 1 The National Library of Brazil.

This act had the immediate consequence of elevating the profession to a “profession of superior level,” and was regulated by means of the Law no. 4.084/62 and Decree no. 56.725/65.

By this time there were 10 courses of Library Science in the country and by the end of 1969, eight new courses had been created. Between 1970 and 1977, 11 new additional courses were created. In the structure of their curricula, these courses followed the national model “Minimum Curriculum,” which began to be criticized for being overly bureaucratic and an impediment to timely changes in the curricular structure.

In 1971, the Brazilian Association of Education for Library Science and Documentation (ABEED) announced that it agreed that a revision of the curriculum was necessary. In 1980, the Secretariat of Higher Education of the Ministry of Education and Culture organized a task force, MEC/ABEED. A year later, they presented a proposal to the Federal Education Council for the restructuring of the Minimum Curriculum for Library Science courses.

The second minimum curriculum for undergraduate coursework in Library Science was approved in 1982. It established a minimum course duration of 4 years and maximum of 7. The new curriculum established core courses for Communication, Society, Economic and Political Studies of Contemporary Brazil, and Cultural History; Basic courses for Logic, Portuguese Language, a Modern Foreign Language, Methods and Techniques of Research and Professional Development courses in Applied Information for Library Science, Production of Knowledge Registers, Collection Development, Bibliographical Control of Knowledge, Dissemination of the Information, and Administration of Libraries.

All previous legislation concerning Library Science education was revoked by the new decree no. 9.394, passed on December 20, 1996. The new curriculum directives allowed for more flexibility with course structures addressing new issues relevant to Brazilian society.

Today there are 43 Library Science courses in the country following these curriculum directives; 70% are established in public institutions and 30% in private institutions. Library schools are mostly located in the South-eastern region (47%).

One of the newest courses in the country was established by the Federal University of Rio de Janeiro in July of 2005. This Course of Library Science and Management of Information Units (CBG) aims to produce library managers and administrators qualified to function in the twenty-first century, where flexibility, speed, autonomy, innovation, and competitiveness are the best words. This course, whose first group started in August, 2006, includes in its curricular package, the same disciplines of Library Science and Administration in the same proportion, but goes beyond the general matrix necessary to form professionals attuned to the demands of the current marketplace.

Graduate Courses

The creation of the Brazilian Institute of Bibliography and Documentation (IBBD) in 1954, had great importance for the formation of Library Science professionals in Brazil as it offered the first courses of graduate level study in the field.

Particularly noteworthy was their first Course in Scientific Documentation (CDC) for—initially—librarians, with the goal of enabling them to work with technical and scientific literature. This course trained innumerable librarians from Brazil and elsewhere in Latin America until the end of the 1960s. In the 1970s, the IBBB became part of the new Brazilian Institute of Science and Technical Information (IBICT) which, nevertheless, maintained the IBBB’s concern for access to information and interest in the formation of human resources in this area.

Strongly influenced by the international movement to create a new program, the first graduate course at the master’s level, entitled the Information Science Course was established in 1970 for IBICT. Until 2000 it was affiliated with the Federal University of Rio de Janeiro (UFRJ). During 2003–2006 it was affiliated with the Federal Fluminense University (UFF). Currently, it is renewing ties with the UFRJ, as part of the same University’s Center of the CBG—Center of Legal and Economic Sciences (CCJE).

According to Christovão,^[3] Brazil had no qualified individuals to teach at the master’s level in Information Science; consequently professors were imported from England and the United States by IBICT to teach the graduate level courses. Over time, as Brazilian students graduated and became qualified teachers and researchers, they obviated the need to import professors. Steadily they began to take over the advising of theses and dissertations and directing new lines of inquiry.

As of 2008, there are eight graduate programs of Information Sciences in Brazil and the discipline figures prominently in two others: in the Graduate Program in Communication, at the School of Communication of the University of São Paulo (ECA/USP), and in the Graduate Program in Communication and Information of the Federal University of Rio Grande do Sul (UFRGS).

THE JOB MARKET FOR LIBRARIANS

The accelerated transformations occurring world-wide have radically influenced work processes in all professions. Amongst other factors, the revolution in the world of microelectronics and telecommunications (CD-ROM, robots, Internet, email) and the shift from the industrial age to the information age has profoundly changed educational policies. This visible transformation of the labor market requires a new model for academic preparation, one that responds to the need for increasing professional competencies that can address unpredictable situations.^[4]

As the profession seeks to maintain relevancy and renewal, the teaching of Library Science, structured systematically, must continually identify the characteristics and conditions of the labor market and fields of research in relation to the profession of the librarian.

Historically, the labor market for librarians was limited, as Fontoura notes, to the preservation of information in the form of clay tablets, parchment scrolls, or papyrus sheets.^[5]

In Brazil, according to Stumpf,^[6] the librarian became an integral part of the work force after the creation of the first course for Library Science, in the National Library. From this point forward, the professional was absorbed by the budding labor market, and primarily by public service institutions.

In the 1960s with the recognition of the profession as being of “superior level” and the promulgation of Law 4.084/62 that regulated the profession, the market expanded with new opportunities. With this growth and expansion, however, arose many new avenues of research.

Studies on the Labor Market for Librarians

Among the many studies on the labor market for librarians expanding in the 1970s, that of Souza and Nastri^[7] stands out for its view that the major problem of the librarians’ labor market stems from the lack of any effective, serious national policy addressing or regulating the profession. Corroborating this position, Souza^[8] highlights the varying conditions and inequalities of working environments in Brazilian libraries that librarians face. An exit strategy for this situation came with planning and coordination at the national level of professionals, interested politicians, and appointees, which enabled and legitimized the performance of library professionals and enhanced their value in the eyes of the general public.

Again, referring to Souza and Nastri,^[7] the course curriculum for Library Science did not reflect a consensus about the type of professional the courses would turn out because too much emphasis was being given to technical practices. They also indicated that too many professors were out of touch and not keeping up with current research; the quality of students entering the undergraduate courses declined each year and seeming to lack enthusiasm for the course or even interest in it.

Other studies on the labor market of the librarian carried out in the 1990s emphasized the diversity of professional opportunities: documentation services, communication and information, culture and leisure, education, research, information, technology, planning, and policymaking. Mueller and Baptista^[9] analyzed the performance of Library Science students in the local market of the Federal District of Brasilia before and after graduation. The study by Tarapanoff^[10] sought to identify the profile of the information professional facing the challenges presented by the new technologies for interlibrary exchanges. Finally,

Maranhão^[11] researched the labor market of Rio de Janeiro with the intention of revising the Library Science curriculum prevalent in the 1980s. “Change” is the ever-present keyword in these analyses coupled with a call for adaptability during times of continual evolution. In the studies, the labor market described consists of several types of institutions with different foci. At the same time, they characterize the typical librarian as a professional who invests little in continuing education and seems unprepared to face the challenges presented by the evolution of technology and increasing globalization.

Tarapanoff^[10] argues that from the decade of 1990 there were many changes to the social and economic environments that impacted the strategies, structure, and the management of information centers or units. She observes that society is increasingly more dependent on information which she asserts will give rise to a broader labor market for the librarian and more recognition of the role libraries and library professionals play.

Although the dependence of society on information and of its ability to broaden the horizons of the librarian’s labor market, it is evident that this will only happen if the library professional is able to adjust to the new demands. To become a modern professional it is necessary to continuously adjust to new paradigms as they relate to the services and concepts of information. Courses for professional training must consider the dynamic, ongoing changes, injecting new content and practices into its programs to address these new situations.

Segmentation of the Labor Market for Librarians

While analyzing the labor market for librarians, Valentim^[12] was the first to identify three major sectors: the traditional information market; the “unoccupied” information market; and the “information-trends” market.

The first group—the traditional information market—represents the one most sought after by professionals and the one most highly recognized by society.

Within this sector, the public library is most familiar and attracts a great number of professionals. Unfortunately in Brazil, due to the dearth of school libraries, the public library tends to function more as a school library and this distorts the role its professionals perform. Consequently public library services may take a back seat to the school library services demanded by the users. Among the major public libraries in Brazil are the National Library located in Rio de Janeiro, the Municipal Library of Sao Paulo, the State Library of Rio Grande do Sul, and the State Library of Bahia.

School libraries represent another type of library in this first group. Most suffer from inadequate funding resulting in a myriad of deficiencies. On the whole, school libraries are staffed by persons with limited or no professional library training and users, not knowing the educational background of the attending person, may inappropriately

disparage the image of the librarian for inadequate rendering of services. Some private schools do have adequate libraries with trained personnel such as the American Schools in Rio de Janeiro and in Sao Paulo, Colégio de São Bento in Rio, as well as the many binational English language schools located in most major cities.

University or academic libraries also employ a great number of professionals. Although chronically underfunded, they stand out for having seemingly endless users that require efficient library products and services. Nearly all public universities and many private ones have one or more libraries for their students and faculty members. Some notable libraries with online services are at the University of Campinas, the Federal University of Rio de Janeiro, University of Sao Paulo, Federal University of Minas Gerais, University of Brasilia, and the Catholic Pontifical Universities in Rio de Janeiro, Sao Paulo, and Porto Alegre.

Also in this sector, specialized libraries include the libraries of research institutions, think tanks, or corporations, both private and public. These are almost exclusively located in metropolitan areas and attract a considerable number of professionals. It is worth noting that in the case of private companies, any financial turbulence directly impacts library funding, particularly staffing patterns and collection development. This instability demonstrates the questionable importance that entrepreneurs give to their information services. On the other hand, research institutions and think tanks, besides having better qualified staff (often with doctorates) than might be found in corporations, tend to value the services offered and usually invest heavily in resources for its library. Some of the outstanding specialized libraries are the Library of the Federal Senate in Brasilia, specializing in social sciences, law, and politics; the Pan American Health Organization Specialized Center BIREME offering medical and health information online and the Instituto Brasileiro de Informação em Ciência e Tecnologia in Brasilia which offers a wide variety of information resources in their library and online.

Cultural centers, which may also be considered as modern public libraries, are slightly different in that they usually function in partnership with another institution, and are located next to a museum, theater, auditorium, or cinema and often close to one or more of such facilities offering a variety of cultural activities for leisure and entertainment. However, although they are in larger urban centers where the demand for cultural activities is greater, these libraries tend to hire few professionals.

Archives and museums located in urban areas are also part of this sector and usually include a library space in their facilities; however, they also tend to hire few librarians.

The second sector, existing information markets but occupied by non-librarians, mainly pertains to school libraries. Few school library staff are trained librarians, in

spite of the constant vigilance of the Federal Council of Library Science and 15 regional councils which are authorized to levy fines on unqualified or undocumented practitioners and their employers.

Publishing houses and bookstores also hire very few Library Science professionals, although they could be very useful in this sector providing specialized expertise in cataloging and scientific editing for publishers and in bookstores, collection development, and publicity or public relations services. With the creation of the position of "literary consultant," this market sector is experiencing growth. The consultant is a type of reference librarian who provides clients with information on titles of specific interest.

Private companies, even those without a physical library, can use librarians as information purveyors or analysts, supplying relevant information to make the company more competitive in its business.

Internet service providers and Web-based purveyors represent another under-explored opportunity. They have the need to organize, process, and disseminate the information they manage—tasks that are basic to the profession. Databases are also fertile grounds that use few librarians tending to prefer systems analysts. Some of the major database content providers are SciELO, the Scientific Electronic Library Online covering a selected collection of Brazilian scientific journals; BIREME mentioned above and the IBICT online resources.

Librarians are finding that work as contractees or consultants is becoming an alternative to full-time, steady employment but this usually requires a great deal of experience, a recognized name, and the capital to invest in one's own business.

The third sector, that of, the "informational-trends" market, consists of a prospective market for librarians that demands performance based on the paradigm of access to information, when information is considered fundamental to the development of an organization.

The librarian who is prepared to offer excellent information services will have a place of prominence in this market; however, to act in this niche with quality and ability, the librarian must be sufficiently observant; act in an enterprising fashion; be flexible, dynamic, bold, a team player, pro-active and, mainly, to be future-oriented and interested in continuing education.^[12]

CONCLUSION

The evolution of Library Science in Brazil now points to a paradigm shift toward emphasizing ease of access to documents and the information contained within, and the abandonment of excessive concern with the conservation of collections. With this new focus, the discipline that has benefited enormously from the technologies of information and communication now requires a professional cadre

capable of addressing this new proposal: to give the right information to the right user at the right time to satisfy his/her informational needs.

It has become increasingly important that there exists a perfect harmony between the library schools and the marketplace. Schools need to provide students with the opportunity not only to learn about modern technologies related to information, but also to develop the management skills necessary to administer the full gamut of information resources, financial resources, material, and human resources. Library Science programs also need to consider the development of appropriate attitudes to manage the social responsibilities of the profession the student has chosen. In turn, the marketplace needs to monitor these abilities, ensuring that future professionals attain the levels of competency that the general public and the marketplace require.

Brazil: Library Science—Distance Education

Mariza Russo

Federal University of Rio de Janeiro, Rio de Janeiro, Brazil

Abstract

This study presents an innovative approach in the field of librarianship fostered by the Federal Council of Library Science and the Open University of Brazil (UAB) that encourage the implementation of a bachelor's degree in library science via distance education (DE).

The distribution of classroom courses in the country, concentrated primarily in the big cities, is described, emphasizing the need to expand the education of librarians to meet the demands of professional positions of information, especially in smaller cities and rural areas. It relates the first steps to implementing the DE course, which is supported by the Center for Higher Distance Education in Rio de Janeiro, an institution that has extensive experience in preparing materials for this type of education. The different stages for planning the development of tasks involving the preparation of teaching materials for DE are outlined. It also points out that the Federal University of Rio de Janeiro was selected, through public bidding, to take on this challenge, which is scheduled for implementation in December 2015, when simultaneously the UAB will launch the course via the public education institutions. The innovation that this initiative brings to the country can be summed up by the possibility of expanding access to information for Brazilian citizens and the opportunity to include a large proportion of the Brazilian population in higher education.

INTRODUCTION

Since the 1970s, new technological dynamics, coupled with the focus on flexibility and on the variety of organizations, stand up to mass production unleashing intensive information technologies, which are fast becoming key competitive strategies of the twenty-first century. Such an environment is characterized by great changes, in which scientific and technological knowledge constitutes the basic inputs of the organizations where the slogans are flexibility, speed, autonomy, innovation, and competitiveness.^[1]

In this context, the economy, previously based on land and capital, evolves to be based on knowledge, requiring the mastery of new knowledge bases and the ability to transform them into competitive advantage.

The society that emerges from this paradigm shift—alternatively called the Information or Knowledge Society—requires interdisciplinary collaboration and educational projects that meet the challenges of scientific and technological advances and justify their academic programs in a manner that guarantees a quality education compatible with the demands of the professional market.

Oliveira^[2] states that the resources of these emerging technologies are important tools in the Knowledge Society; however, it is pointed out that the partial integration of peripheral countries to the new economy—with unequal access to information and knowledge—sets insurmountable limits to underprivileged social segments to meet the challenges of the current technoeconomic context.

Studies by the Paulo Montenegro Institute (IPM)—a Brazilian nonprofit organization that develops and executes projects in education^[3]—show that even in the metropolitan regions of Brazil, where the potential access to educational resources is greater, literacy skills may still be insufficient. Data from the National Index of Functional Literacy (INAF) show that Brazil has advanced, especially in the early levels of literacy, but has failed to visibly progress in achieving full domain of literacy skills that are essential for full inclusion in a literate society. According to the IPM educators, much of this progress is due to universal access to primary and secondary schooling. They understand, however, that despite the progress, the difficulties that reach higher levels of literacy are increasingly acute for much of the population.

Other studies recorded by INAF show that the arrivals of new social strata to the higher educational stages come often accompanied by a lack of suitable conditions for these strata to reach the highest levels of literacy, thus reinforcing the need for a new quality of education. They also highlight that quality involves not only the amount of study hours or the increase of the amount of content taught, but also among other things the creation of new flexible models that allow any Brazilian to broaden their studies when desired at different stages of life.

In turn, the educator Arnaldo Niskier^[4] stresses that for many years the Brazilian educational system was centered on a classic paradigm, in which the physical structure of the school was recognized as the only place from which knowledge emanated. This conventional model of

education had a major drawback, which was translated into the homogeneous treatment of students while completely ignoring the learning pace of the individual student, resulting in losses both in the teaching and learning processes. In this learning process, there is a precondition for the existence of two parts, which should have complementary goals, that is, that one wants to learn and build new knowledge and the other wants to share and teach.^[5]

However, the interaction between these parties doesn't to occur linearly; such procedures should be designed not as a mere transmission and acquisition of knowledge, but rather as a joint construction of them, in which the party in charge of teaching assumes responsibility for the guidance and knowledge construction of the party interested in learning. This process is characterized as guided, social, and communicative, resulting in a shared knowledge that includes the active participation of students in the subject matter.

It is at this juncture that distance education, with its concept of open education, can be considered an innovation in terms of education, given the new, added components such as flexibility of programs, agility of administrative mechanisms, and fundamentally, the emphasis on student autonomy regarding the choice of location and hour of study.

From the perspective of Formiga,^[6] the modality of distance education, both as undergraduate and graduate studies, in different areas of knowledge, contributes to make available a pedagogical proposal, which aims not only to address theoretical and technical training but also to enhance the socialization of learners, which is essential to meet the needs of the current international educational scene.

Although Brazilian universities are offering undergraduate courses, specializations, and master's degrees in the classroom and by distance, thus enhancing higher education in the country, these institutions are mindful in maintaining the quality of this educational experience. It is precisely with this in mind that the Ministry of Education evaluates any course offerings. On the other hand, students envision the expansion of distance learning courses as a way to recover study time that was not completed, or an alternative to reconcile work and study simultaneously. Other points in favor of distance education are the convenience and easiness for those living far from large urban centers. Thus, the expansion of distance education occurs both by educational institutions and by students interested in this type of study.

The legislation regarding distance education in Brazil was first mentioned by Law No. 5.692, dated August 15, 1971, using correspondences, radio, and television on supplementary courses. However, the Law of Guidelines and Bases (LDB) dated December 20, 1996, allowed the higher education system to enlarge the visibility and applicability of this sort of education.

A new decree, No. 5,622, dated December 19, 2005, repealing the previous ones in some aspects, presents 37 articles with improvements to distance education.^[8] The changes made by this new decree promoted greater credibility to distance education, especially the issues of compulsory attendance to classrooms, not only to perform evaluations, but also to allow participation in internships and the defense of final papers. This measure leading to the creation of centers for distance education emphasized that the results of classroom tests should prevail over other evaluation results. Another relevant issue regarding this decree was the application of the National System of Higher Education Assessment to the Higher Distance Education movement.

Besides the rapid technological developments and the new act mentioned earlier, in 2005 the creation of UAB made possible the expanding and the strengthening of distance education. UAB was established, with ties to the Coordination of Improvement of Higher Education Personnel (CAPES). The goal was to broaden entry to higher education for people from all social classes with the ultimate result being a significant, positive impact on the workforce of the country.

Using the English model of their Open University, the creation of UAB was driven by the unfavorable educational environment existing in 2004, when only 11% of young people aged 18–24 had access to higher education in the classrooms. This low percentage led the government to create policies generating growth in the number of places available in higher education and thereby promote more opportunities for education in the country.

In order to combat this scenario and to improve the Brazilian workforce, the UAB was created by the Ministry of Culture with the mission of offering higher education courses and distance programs in partnership with public universities through consortia with both municipal and state governments.

UAB's project represented a landmark for Brazilian education given its purpose of expanding access to higher education and the training of teachers for basic education. It emphasizes the articulation of public institutions of higher learning with the centers for distance education designed to support, in a decentralized manner, educational and administrative activities.

For this purpose, the UAB system was created to unite public institutions of higher education that offer on-campus courses and distance education programs. These institutions, in addition to having a well-established university campus, must have confirmed experience in research and extension required for the successful implementation of distance learning initiatives.^[9]

This system was created to meet the unmet needs for higher education, especially for students who live in regions far from major urban centers. It supports the adoption and promotion of distance education through the use of ICT and various learning resources: printed material,

audio, video, multimedia, Internet, email, chats, forums, and videoconferences. Since 2007, this system is linked to the CAPES, Brazilian institution that plays a key role in the expansion and consolidation of higher education in the country.

Nonetheless, the usage of undergraduate distance education in Brazil could be stronger as the UAB system offers fewer than 100 bachelor degree programs, with an emphasis in management (80% of courses). Until further expansion of the program occurs, it is not possible to reach more conclusive results as to the effectiveness of the programs.^[9]

In parallel to the Brazilian educational scenario, one field of study, library science, is becoming an area of training professionals to manage the vast information generated worldwide, with the mission to promote optimal recovery in benefit of the society.^[10] This training has, so far, been grounded in classroom courses, heavily concentrated in the Southeast region of the country preparing professionals to work in larger cities but leaves mostly public library positions unoccupied, or occupied by laypersons, in smaller Brazilian cities.

In view of the arguments presented earlier, this study analyzes the implementation of the Bachelor in Library Science from a distance education perspective, which is an innovative alternative to meet existing demands in the professional labor market of Brazilian libraries.

Another justification for analyzing the initiative lies in the fact that the vast majority of actions undertaken so far in the implementation of distance learning in the field of librarianship cover postgraduate courses only. These situations have not produced the expected effect in the area, partly because of the small number of courses offered and, second, because almost all courses created involve costs that are beyond the ability to pay for most Brazilian professionals.

TRAINING IN THE AREA OF LIBRARIANSHIP

In Brazil, library science began when the first libraries were founded, arising from the religious orders of the Benedictines, Franciscans, and Jesuits. However, the true roots of the field of library science are attributed to the creation of the National Library (BN), which had its origins in the Royal Library brought to Brazil by the Portuguese royal court in 1808. Its official foundation occurred in 1810, and in the following year it was opened to researchers who obtained royal consent. In 1814, it was fully opened to the public.^[11]

While in Rio de Janeiro the development of the field of librarianship has been linked to the trajectory of BN, in São Paulo, it was influenced by the school library of the Mackenzie College. However, in both institutions, the pressing concern at the time was the need to resolve internal matters such as unprepared personnel managing these libraries much more than training staff to work in any kind of library.^[11]

The Federal Council of Library Science (CFB) considers that library science began as a field of study in Brazil in 1911, when Manuel Cicero Peregrino da Silva, director of the National Library, officiated the creation of the first librarianship course in Brazil. It was also the first such course in South America and the third in the world.^[11]

Until the early 1930s, Brazilian librarianship was under the strong influence of the French humanist model of the *École Nationale des Chartes*, a course founded in France in 1821, which was the first school in the world created for the education of personnel to work in libraries. When creating the Elementary Course of Library Science in 1929, the Mackenzie College in São Paulo initiated the most pragmatic course using American technical standards as a basis of instruction.^[12]

Based on the course taught at the Mackenzie College, in 1936 the first school of librarianship was established. It was initially part of the São Paulo Department of Culture and later was incorporated into the Free School of Sociology and Politics, also based in the city of São Paulo. This new school of librarianship focused heavily on the technical aspects of librarianship and strictly adhered to American principles as practiced at the course of Columbia College in the United States.

The 1940s saw the development of modern techniques of library science in Brazil and also witnessed the expansion of librarianship courses to other states. In the 1950s and 1960s, the creation of professional library associations in the country, as well as the completion of the first professional events and congresses in the field, created even more opportunities for relevant professional education and development. These events were promoted with the aim of bringing together librarians from throughout Brazil, in order to exchange experiences. They also gave rise to the creation of numerous libraries, particularly in federal agencies all the while encouraging further participation of candidates in professional courses. The various courses of librarianship in the country began to emerge in 1942 in several states, mainly linked to the federal universities, and by 1965, there were 14 official library science courses.

Since the enactment of the LDB, which repealed all previous legislation concerning undergraduate courses, professionals in the field of librarianship began discussions on the guidelines set out in the Act. The resulting document, "Curriculum Guidelines for Librarianship Courses," relaxed the curricular structure of training courses for librarians, being more directed to the needs of Brazilian society. Presently, the 43 existing courses in 2014 in the country follow these guidelines in establishing their curricula.

MODEL CLASSROOM TEACHING OF LIBRARY SCIENCE

The CFB indicates that the number of classroom-skilled library professionals working in Brazil is approximately

Fig. 1 Number of librarianship courses in Brazil.
Source: From Russo.^[1]

30,000 librarians. This data may be contrasted with the vast continental dimensions of the country and its population of over 200 million inhabitants, resulting in a scenario in which information is considered a vital asset (Fig. 1).^[13]

When analyzing the distribution of library science courses in Brazil, the following chart shows the highest incidence in the Southeast (44%), which is also the most economically developed region of the country.

Fig. 2 shows another aspect of the distribution of librarianship courses among Brazilian regions allowing the analysis of the relations between the number of courses and the size of Brazilian region.

Fig. 2 Librarianship courses in Brazil regions.
Source: From Russo.^[1]

In analyzing this distribution, the CFB highlights that the distribution of bachelors' training courses for librarianship is deficient in relation to the size of the country, especially with regard to the North and Midwest, which in geographical terms represent more than 50% of the national territory.^[13]

The data allow us to state categorically that the distribution of trained and qualified professionals in the country reflects the need to provide alternatives for the education of librarians to meet the significant social demand for effective information services.

Thus, considering the disparities exposed with current offerings for bachelor's degree courses in library science, the alternative methodology of distance education could serve to reverse the current scenario.

Library Science and Distance Education

The involvement of librarians with distance education dates back to the late nineteenth century, when, in 1888, American librarian Melvil Dewey invited professionals from the School of Librarianship in Albany, NY, to develop correspondence courses to update librarians in small American libraries.^[14]

In Brazil, distance education in library science has occurred more significantly during the last ten years, focusing on graduate-level courses. Such initiatives almost always aim at training professionals on current issues or topics in which their work activities require specific training. Many institutions are offering these courses, both in the public and private sectors, encouraging either recent graduates or more experienced librarians to embrace these opportunities for improvement or continuing education making use of one of the main facilities of distance education, which is the flexibility of time and place to study.

Libraries, in turn, are also making use of distance learning platforms to provide courses and training for users in various topics of interest such as information literacy, standards of scholarly work, access to databases, and many others, some of which already perform reference service through these virtual tools to promote real-time interaction with its users.

There are few studies analyzing the application of distance education in undergraduate courses in librarianship. Most of them present initiatives in disciplines where professors give classroom lectures complemented by distance learning sessions, which are used in virtual learning environments (AVAs). Among these environments, the most used is called Moodle, created in 2001 by Australian educator and computer scientist Martin Dougiamas, which allows open access. This software provides the instructor with tools for creating web-based courses with access control so that only enrolled students may have access to its content and facilities.

Even with the scenario described earlier, distance education in Brazil has been developing in various disciplines. Since 2006, the government has been providing greater incentives for the creation of numerous undergraduate courses in this mode by UAB.

The idea of creating an undergraduate degree in librarianship via distance education arose from the demand at the Open University in 2008. There was a great need to prepare library technical assistants to meet the needs of the classroom centers and libraries that were unable to service users taking their courses.

Motivated by this invitation and the opportunity to take higher inland education, the CFB, aware of the Brazilian library scenario and the lack of qualified personnel to develop products and services tailored to the needs of its actual and potential users, presented a counterproposal to the sponsoring agency suggesting the design of a distance course, not for the preparation of technical support personnel but instead for the training of full-fledged librarians. To support their stance, they used examples of international experiences in other countries based on current professional literature.

The acceptance of this counterproposal resulted in a partnership between the UAB and the CFB for the development of the pedagogical content of that course. This choice was considered due to the fact that the UAB system functions as the connector between higher educational institutions and state and local government in order to meet local demands for higher education. It was also reasoned at that time that the educational institutions that would be responsible for offering the courses in distance education would be exclusively public, federal, state, and municipal institutions called public institutions of higher education (IPES). This decision was based on the fact that these IPES that act with the support of classroom centers functioning as operational units with administrative and educational activities also provide the physical, technological, and educational infrastructure for the monitoring of distance courses.

Given this structure, various documents were drawn up by working groups of the two institutions involved including the pedagogical foundation to support universities that will offer training in distance education for librarianship. Using as a basis the studies of the Brazilian Association of Education in Information Science, the pedagogical design of the course was structured in eight different sections: Section 0, Basic Module; Section 1, Theoretical Foundations of Library and Information Science; Section 2, Organization and Representation of Information; Section 3, Resources and Information Services; Section 4, Policies and Management of Information Environments; Section 5, Information Technology and Communication; Section 6, Research in Library and Information Science; Section 7, Internships and Complementary Activities.

The proposal of the course curriculum covers a total of 2685 hr, distributed in eight distinct sections, lasting 4 yrs

or eight semesters. In the project, it is emphasized that “[...] the details of the school year and semester modules must be in accordance with current legislation, with the school regulations of the university and the proposed project submitted and approved by the UAB” (Reference,^[13] p. 22).

The counterpart of the institution that will offer the course must demonstrate the physical, material, and informational resources available as well as faculty members (teachers and tutors). For the latter, the weekly workload timetable, curricula, and other documents proving their competence to teach must also be presented.

The project also stipulates that tutors will play a fundamental role in the process and, therefore, should be described in detail by the proposing institution. They will be responsible for distance tutoring while mediating the learning process with those students geographically distant. Tutors will attend students at the classroom centers at reserved times. The tutor should therefore be well versed in the pedagogical course design; the teaching materials and the specific content under his/her responsibility, in order to answer questions, assist in individual and group activities and also participate in the evaluation process with teachers.

As for the administrative part, the IPES shall provide technical personnel to offer the support needed to complete the courses under their responsibility. This will include tasks emanated from the faculty members at the headquarters of the institution and also in the classroom centers. In these spaces, there will be technical support jobs for the provision of libraries, laboratories, maintenance of equipment, and physical facilities. This team should also operate in the academic department of the course, with the records and monitoring of enrollment and academic procedures, as well as providing academic support to tutors and teachers in classroom and distance activities.

The importance of the communication process is stressed in the project, insofar as the success of a distance course depends on the interaction between all participants in the process. In this sense, one should rely on an AVA, which should enable the following features: electronic mail, videoconferencing, discussion forum, chats, and other means of communication.

Also described in the pedagogical project is the curriculum content of the course, focusing on the sections previously mentioned, showing the options and objectives of each discipline.

After approval of this pedagogical project, CAPES launched in 2012 a Request-for-proposal (RFP) to select the Brazilian university that would manage the production of educational material to be offered by this course. Five institutions submitted proposals and the Federal University of Rio de Janeiro (UFRJ), through the Course of Library and Information Management Units (CBG), were selected to develop this innovative task.

The Notice 12/2012, which selected the UFRJ for managing the production of this course, also gave financial resources to select and train instructors for the content development of the many disciplines that make up the course curriculum. The Center for Distance Higher Education of Rio de Janeiro (CEDERJ) was chosen as UFRJ's partner institution in this project and is responsible for training the content developers, as well as for monitoring the production of the material to ensure consistency with the special characteristics of distance learning and teaching. With regard to expected results, the main points to be considered were 1) store the material developed by the project in a virtual repository, to be available to all IPES coordinators of the courses; 2) follow international standards to enable interoperability between different platforms; 3) prepare metadata that is compatible with international standards to enable the retrieval of information.

Thus, it was necessary to set up permanent teams to monitor and provide technical and operational support to the project. The following teams were created: 1) Technical Commission of Librarianship for Monitoring and Evaluation (CT) established by CAPES with the task of monitoring the management of the content development process of teaching materials, as well as other issues relating to the course offerings in library science under the UAB system. They act as an advisory committee. 2) Management Commission for the Production of Teaching Materials for the Library Science Course in Distance Education (CG) established by UFRJ, which is comprised of four members and two alternates, five of them are LS professors and one is a librarian from the CBG/UFRJ. Its function is to manage the operation of the project for production of teaching materials, monitoring the performance of all parties involved in the process. 3) Evaluation Commission of the Production of Teaching Materials for the Library Science Course in Distance Education (CA) established by UFRJ, being formed by two members nominated by the Technical Commission for Monitoring and Evaluation of Library Science, two members nominated by the Commission of Management of Production of Educational Materials of the course on librarianship, and a member of the distance education specialist, with experience in the production of educational materials for distance education. Its functions are to participate in the selection process of authors and readers, follow the process of production of teaching materials, and verify if the contents meet the guidelines of the pedagogical design of the course. This commission shall have a deliberative nature and includes CAPES participation in its decisions.

A summary of the key steps of the implementation process of the project of management of the distance education teaching materials for the course is presented here:

1. *Analysis and selection*: Selection of authors and readers and hiring technical staff; training of authors

and readers; signing the Declaration of Commitment; setting deadlines for delivering the materials and Deed of Assignment of Rights of Use for the teaching materials and support within the UAB system and in projects, programs, and courses of interest to the federal government.

2. *Design and development*: Creating and augmenting the virtual repository; preparation of teaching materials by subject (author); proofreading the teaching materials by subject (reader); preparation of instructional design and graphic design; CG and CA managing the preparation of teaching materials by subject, and validation of the material by CT.
3. *Certification and printing of course materials*: Registration of the teaching material produced in the International Standard Book Number, by the National Library Foundation Registration; production of matrices/electronic files for reproduction and control of the production of the material by CG.
4. *Delivery of material*: Recording of the materials developed; submission of materials to CAPES; sending interim and final reports on the progress of the project to CAPES/UAB.

It is important to note that the steps mentioned earlier will be followed to develop each of the disciplines, while seeking to meet the goals of the teaching and learning process and the guidelines of the educational program.

Besides the mandatory printed course material, supporting materials such as videos with the presentation of the course, tutorials, and programs of specific subjects for teachers, tutors, and students will also be produced.

After the design of the project, the team at UFRJ started actions aimed at developing a methodology for its implementation. These actions describe the path from design to development of this entry.

In order to maximize efforts, formal partnerships were made between UFRJ and the following institutions:

- Cederj—For advice on training and instructional design of the object of this public notice process;
- Jose Bonifacio University Foundation—To support the financial management of resources allocated to the project.

For the physical execution of the project, we sought a proper installation within the university campus at UFRJ, with the ultimate decision to occupy space at the Center for Distance Education (NEAD), a newly created center at UFRJ to provide the technological infrastructure and logistics for the development of distance learning courses at the university.

The development of this course material is scheduled to be completed by the end of 2015 or early 2016, when the subject content of the first four periods will be ready. At that point, CAPES will send out another tender for the

launching of the first official course in distance education for library science.

The preparation of this course content will result in a new, dynamic program of library science offered via distance education, which should meet the demands of the labor market in urban as well as rural areas. In this context, the expectations of the Brazilian government for the expansion of training opportunities at the university level should serve as a guiding point of this initiative.

CONCLUSIONS

The changes perceived in society, arising from the availability of vast amounts of information transmitted primarily by electronic networks, are omnipresent and causing a substantial impact on the socioeconomic, cultural, and educational environments of the world.

With regard to Brazil, concern about access to information and, hence, knowledge, on the part of its population also poses serious problems for the government, not only because of its territorial dimensions, but also because of persistent social inequalities observed in the regional development of the country.

The conventional educational model in effect throughout the entire country makes clear that the difficulties arising from this type of education will not be resolved in the short term, thus leaving a large part of the population on the sidelines of any formal educational activities.

In this context, the modality of distance education is considered a viable way to promote changes in an unfavorable environment leading to an education for many people who, for different reasons, have not had the chance to obtain one by traditional methods. This concept of teaching—more open, flexible, agile, dynamic, and autonomous—is being seen by the Brazilian government as a strategic tool to insert citizens into society, bringing improvements for their future and for the country in general.

In order to achieve this goal, UAB was created in 2005. Among its objectives is to offer degree courses in different fields of knowledge, expanding access to public higher education. In 2008, the discipline of library science was selected to create a new undergraduate course in this mode of teaching.

As mentioned in this study, the fact is that the choice of this area fell, first, on the issue of providing libraries to the Centers of Classroom Support (PAP), units that physically support the courses of UAB. However, negotiations with the CFB brought to light other demands of jobs for librarians, such as part of the labor market, which had professional posts in public and school libraries occupied by laypersons. Given this fact, those information units failed to provide the quality services for which librarians are trained and, thus, society lost out on that benefit.

We conclude that the provision of distance education courses in library science, with its more inclusive proposal, stands out as truly innovative, as it proposes to raise the bar for teaching in the area while increasing the possibilities for training professionals throughout the country with the goal of meeting the needs already identified.

One of the innovative aspects of this course lies in the initiative having been fulfilled by a partnership between a government agency, CAPES/UAB, and a professional union, the CFB, in order to conduct an educational course for professionals to work in the country's libraries, thereby solving the problem of a lack of qualified professionals in so many units of information such as documentation centers, special libraries, or public/academic libraries.

The increased supply of education in library science combined with opportunities for broader access to the course via distance education can lead to advantages for the candidates, such as saving time and resources, convenience of study, autonomy and flexibility in the tasks, and monitoring by tutors and more. This innovative characteristic of work and learning serves well as an enriching element of the educational process.

The incremental development of instructional materials and content produced for the course in distance education will also help classroom courses offered in the country, since this type of material has unique characteristics. They are written specifically for the student body, with the central aim of awakening their interest. The personal and conversational style facilitates active student participation in the learning process and eventual application of what is learned.

On the other hand, the production of teaching materials for courses in distance education presents major challenges to the team responsible for its preparation. The approach needs to be multidisciplinary, relying not only on experts in distance education but also on teachers responsible for the production of content, reviewers who are responsible for grammatical and editorial revisions, and experts in design and visual programming who create and develop graphic design and interactive content.

The strong presence of ICT in the teaching of library science courses via distance education, through the use of AVA, blogs, chats, wikis, and other collaborative writing tools, is considered an innovative approach in the area, a characteristic that may influence classroom courses. It is understood that ICT may serve primarily as a tool to streamline the interaction between the parties involved in the teaching process and the completion of tasks in order to build collective knowledge.

Increasing the number of library school graduates in the country, be it by classroom or distance education, serves well to promote greater visibility for the library science profession and also the body of work it encompasses.

Given these facts, the joint action by CAPES/UAB, the CFB and UFRJ will help significantly in overcoming the

obstacles described. The collective construction, with the overarching purpose to provide as many Brazilians as possible with access to higher education and of ensuring a better life, will also contribute to a stronger, economically sound country.

This effort established a new landmark in the field of library science, but its success will depend on the commitment of the sponsoring institutions, UAB and CFB, and also on the IPES. Through cooperation, this groundbreaking initiative will have the chance to reshape the library science area, and enrich its educational process bringing benefits to the Brazilian society.

ACKNOWLEDGMENT

Abstract

This entry presents a history of the National Museum as an example of the challenges to Brazilian museums facing political objectives at different times. The New Museology is examined, as a landmark for the transformation of the institutions of memory, and an example of the ever-changing activities of the National Museum (Museu Nacional) in Rio de Janeiro. The text should be considered as a contribution to museological sciences encouraging reflections between professionals of different subspecialties in various museums.

INTRODUCTION

Brazil, one of the largest economies of the world, has a land mass covering more than half of South America, and a population of more than 190 million people. Since Pedro Alvares Cabral set foot on the continent in 1500, Brazil has produced a wide range of museums and libraries to serve its diverse population. Brazilian museums have been established and supported by royalties, politicians, bureaucrats, philanthropists, banks, universities, and wealthy families and individuals. The many unique museums found all over the country range from classical art collections in Sao Paulo to snakes and butterflies in the Amazon to creative folk arts depicting the utterly weird to daily life events on the outskirts of Rio de Janeiro. Libraries too have been founded and supported by a similar cast of characters. They are also wide ranging from the massive National Library on Rio Branco Avenue to a very petite one tucked away on a winding, uphill Rio road specializing in only *literatura de cordel* or “string literature” published only in Brazil (Fig. 1).

OVERVIEW

The idea of “museum,” as conceived today, was formed during the Renaissance and subsequent Age of Enlightenment, when the methods, systems, and scientific purposes characteristic of public museums were defined. From the eighteenth century, most notably with the French Revolution, when the concept of “national patrimony” became part of the ideological strategies of the modern European state, the museum would become a privileged space to protect the fragments that “materialize the collective inheritance of the nation.”^[1] It became a symbolic space to legitimize the State, reconciling historical continuity

with the creation of new spaces of memory. Portugal was not exempt from such developments, and colonial minister Martinho de Melo e Castro was instructed by Queen Maria I to require colonial administrators such as Brazilian vice-roy (from 1779 to 1790) Luis de Vasconcelos e Sousa, conde de Figueiro', to send back to Lisbon samples of local flora and fauna—even live animals^[2] and anything else representing the cultures of each colony, its mineral and agricultural potential, and the customs of its inhabitants for inclusion in Lisbon's royal museum, the Real Museu da Ajuda. The object of all this was the embellishment of the capital reflecting the scientific discoveries of the day. Within two decades, however, the capital would be moved from the old continent to the New World, together with the Museum, where it would become the Royal, and subsequently the National Museum, which is now part of the Federal University of Rio de Janeiro [MNRJ].

THE FIRST BRAZILIAN MUSEUM

According to Jose Lacerda de Araújo Feio, director of the National Museum, 1967–1971, the exact date of the inauguration of the House of Birds is unknown. It apparently opened even before the building to house it had been finished. Feio calculates that it started in 1783.^[3] For Maria Margaret Lopes, professor at the Universidade Estadual de Campinas, the Museum of Natural History opened in 1784, the same year in which Viceroy D. Luis de Vasconcelos e Sousa created the Cabinet of Natural History Studies and quite probably the Museum of Natural History as well.^[4] Luis de Vasconcelos e Sousa was succeeded as viceroy, 1790–1801, by Fernando José de Portugal e Castro, future third conde de Resende and second marquês de Aguiar, who was devoid of interest in the

activities of the Museum of Natural History, and consequently, the establishment declined due to inattention and underfunding. In 1810, 20 years after its creation, the director, Francisco Xavier C. Caldeira, died and was replaced by Dr. Luiz Antonio da Costa Barradas. Sometime during 1811, the building was transformed into a workshop for diamond cutting, thus discouraging the collection of animals. On June 22, 1813, Fernando Jose de Portugal e Castro signed decree 20 of Prince Regent Dom João (1767–1826) giving an order “to extinguish the museum of this Court.” All the materials were summarily packed into two large boxes comprised of more than a 1000 bird skins, many insects, and some mammals.

The boxes and the furniture were given, for 1 yr’s safekeeping in a single room, to one Costa Barradas, presumably the father of the namesake Maranhão magistrate Joaquim da Costa Barradas, and the building was later razed.

In its place, a building for the Royal State Treasury was constructed, that later sheltered the National Treasury. In parallel to the decline of the Museum of Natural History, we pass now to an analysis of the situation in Europe as we identify the moment that would change the trajectory of Portugal and, consequently, of Brazil. The transference

of the Portuguese Court was a carefully planned endeavor. It was, without question, a strategic plan, conceived at the end of the eighteenth century, as an emergency solution that would save the Portuguese Crown during crisis situations. However, the transference only materialized when the threat became imminent to the integrity of the monarchy. The Prince Regent Dom João, the future King João VI, convinced that the Crown would only be guaranteed if he could preserve his possessions in the New World, whose vast natural resources were superior to those of Portugal, left Lisbon in November of 1807, with an entourage of some 15,000 courtiers and subjects.

The transference of the Lusitanian State structure to Brazil marked the end of the colonial period for Brazil.^[5] The city of choice was Rio de Janeiro, which was the principal port city and since 1763 the colony’s capital. Shortly after his arrival, Dom João, who intended to transform the region into the capital of the Portuguese monarchy, created a naval academy, a school of gunnery and fortification, a military archive, a gunpowder mill, the São João Theater, a government press, the Botanical Garden, the Academy of Fine Arts, the Chamber of Commerce, and the Royal Library, among others. On June 6, 1818, the Royal Museum was created,^[6] by the decree of

Dom João VI implemented by Interior Minister Thomas Antonio de Villanova Portugal. As a first step, a building was acquired from João Rodrigues Pereira de Almeida, created in 1828, barão de Ubá. Father Jose da Costa Azevedo (1818–1823) was appointed director.

He had previously been responsible for the Cabinet of Minerals and Physics, in the Military Academy. The Royal Museum, known from 1822 as the National Museum, represented, as did other institutions, a “transposition of European models to the tropics, demonstrating an alignment to the analogous initiatives in Europe.”^[1] The first collections of the Royal Museum were indigenous artifacts and natural products of the region. Dom João VI himself offered two octagonal display cases, containing 80 models of workshops of the professions most common at the end of the eighteenth century, made at the time on the instruction of his elder brother Prince Dom Jose, 1761–1788. One example is “a vase of gilt silver, crowned with coral representing the Emperor Constantine’s victory and consequent triumph of Christianity at the 312 battle of the Milvian Bridge; two keys; a carved Greek marble foot with sandal; one firearm of carved ivory from the Middle Ages and a fine collection of oil paintings”^[7] (Fig. 2).

As the monarchy strengthened in Brazil, so did the museum. With João VI’s return to Portugal, his elder son, Dom Pedro, became Prince Regent of Brazil and, as such, opened the Royal Museum to the public. In October of 1821, public visits to the Royal Museum began as decreed: “On Thursday of each week from ten in the morning until one in the afternoon, not being a holy day, to all persons, Foreign or National, who make worthy use of it for its knowledge and qualities.”^[8]

After this, the collections of the Royal Museum grew as the Brazilian kingdom became an empire with Prince Pedro now Emperor Dom Pedro I, advised by his chief minister Jose Bonifácio de Andrada e Silva to adopt a policy of encouraging visiting naturalists to donate artifacts and samples from the different regions of Brazil for the Museum.^[9] Analyzing the correspondence of the Imperial and National Museum from 1822, we can see that the work of identifying and researching materials and samples sought by the Imperial Government had been added to the activities and responsibilities of the museum staff. It also becomes evident that, from the second half of the nineteenth century, increasing requests for the Museum’s services points to a constant interaction between members of the Government and the administrators of the Museum. Gradually, the Imperial and National Museum became a vital resource center for the Empire (Fig. 3).

As the Imperial government explored Brazil’s natural wealth, and then with the second emperor Pedro II^[10] constantly encouraging scientific studies, the sciences in Brazil developed and grew throughout the nineteenth century. The Museum, with its scientific specialties—such as botany, zoology, geology, and ethnography—provided the

Fig. 2 Golden vase of silver donated by Dom João to the Royal Museum.

Fig. 3 Imperial and National Museum in Campo de Santana, Downtown, Rio de Janeiro.

foundation for great contributions to the natural sciences, heralded in the latter nineteenth century as fundamental to Brazil's progress. As the struggle for independence triumphed and internal cohesion was gradually secured, the Empire, despite its continued dependence on slave-based agriculture, joined the ranks of "civilized" countries. While in 1842, the Imperial and National Museum was recognized as Brazil's national museum, other museums were being created: the Emílio Goeldi Museum, for example, in Belém in 1861, or the Paulista Museum in São Paulo in 1890. The Goeldi Museum stands out as the largest museum of natural history in Northern Brazil. It, like the National Museum, is also dedicated to natural history. The concept of a museum for São Paulo dates back to the year of independence in 1822, but for various reasons, it was only in the Republican period that the institution was consolidated as a "place of memory,"^[12] being inaugurated in 1895. Over the next 100 years, it survived many modifications in its structure and eventually became a historical and university institution connected to the University of São Paulo. In 1946, the National Museum was affiliated with the University of Brazil (currently the Federal University of Rio de Janeiro) and has adapted to the teaching, research, and extension missions of the University. In this way, it was strengthened as an institution of natural and anthropological sciences in an academic environment.

NEW MUSEOLOGY

The science of museums, for many years, was related to the analysis of practices occurring in the various institutions. During the 1970s, discussions about the concepts of museums and patrimony led to the concept of Museology and, in turn, to "a social science that studies museum objects as a knowledge source" in the 1980s.^[13] In this way, the new concept of Museology adjusted to the New History^[14] that had departed from the factual narrative into an alliance with narratives of the oppressed, the disenfranchised, women, Indians, and new interpretations of daily life.

Additionally, we can link studies of Social Memory^[15] and its excellent argument on patrimony^[16] to the exigencies of the New Museology connecting the museum with its community. Throughout the twentieth century, there was a proliferation of diverse thematic museums in different regions of Brazil—some affiliated with universities; others with schools and communities. The museums, when being used as a "laboratory" of an educational institution, provided students the opportunity to improve their knowledge of preservation and scientific analysis through the collections on display and other primary resources. For example, we highlight the current National Museum, an institution that is being used for postgraduate extension courses, research, and education in the areas of

social anthropology, botany, and zoology, but facing the quandary of disconnection from education and research versus extension studies. Education and "elitist studies" done within the museum walls did not reach the community resulting in a dead end as far as outreach was concerned. At the turn of the twenty-first century, this changed with increasing activities directed toward schools and visitors to the museum's expositions. Not satisfied with short-term results, the institution's directors went outside its walls undertaking activities in the Boa Vista Park directly across the street. The anniversary of the institution's founding was chosen for the first such event, and this has continued each year ever since. Under large tents, minilaboratories, simulations, and exhibits are set up for geology, botany, and archaeology, along with presentations of vertebrates, invertebrates, or fossils: a new focus for the museum's activities and a great new interaction with the community. This gave the institution a new look changing it from a deposit for old objects into an educational laboratory presenting the results of research and education directly to the community. The Museum of Art in São Paulo (MASP) has taken outreach and continuing education seriously since the 1970s. Their educational services include children's art clubs, museum studies for students, and guided tours for school groups and adults. Through political maneuvers and policy changes, the museums of the New Museology^[18] have been transformed from places that rescued popular culture only to display it for the benefit of the privileged into vibrant institutions for the education of the entire populace.

Anthropological analysis suggests that museographic representations should be viewed as fact rather than fiction; thus, objects in museums play a strategic role in this process. Objects are seen as part of distant realities in space or time, establishing a delicate continuity that connects the visible with the invisible.^[19]

CONCLUSION

The first museum created in Brazil was established to keep, collect, and conduct research on the country's culture and its vast natural resources. As the years passed, the National Museum became an instrument in the Imperial regime's drive to establish, develop, and unify the nation. This drive extended into the present as many new museums were established in the late nineteenth and twentieth centuries highlighting the historical and artistic wealth of the nation such as the MASP, National Museum of Fine Arts in Rio, Historical Museum of the Republic, Museum of Modern Art, the State Pinacoteca in São Paulo, Casa do Pontal Museum, and Museum of Astronomy and Related Sciences, among many others. For the most part, the role of education in museums during the early nineteenth century, alas, did not last into the next century. Education, research, and public outreach suffered

inferior roles during the twentieth century with a few notable exceptions. These factors culminated in the estrangement of the institution and a lack of interaction between these three functions. According to the precepts of the New Museology, a change was required to present the National Museum's activities to the public, in order to stimulate reflection and appreciation as a tool for education. Finally, we look forward to the day when the daily work of museums will contribute to the integration of different professions: museum specialists, curators, historians, anthropologists, sociologists, biologists, archaeologists, librarians, and archivists. Beyond preserving objects, they must all develop studies that will enhance the knowledge base, updating and disseminating information about museum holdings, thus encouraging more reflection and thought about the resources they exhibit with a multidisciplinary outlook.

British Library

Andy Stephens

OBE, Board Secretary, Head of International Engagement, The British Library, London, U.K.

Abstract

The British Library holds one of the richest and most comprehensive collections of the world's knowledge. The collection is at the heart of the unparalleled range of services that are provided to national and international users in reading rooms and exhibition galleries and through document supply. The Library is active in its use of electronic services and digitization to provide effective and ever-wider access to its holdings. One of its main tasks is to collect, preserve, and provide access to the United Kingdom's National Published Archive. Significantly, new Legal Deposit regulations, which came into force in April 2013, extended this remit into the digital domain and conferred on the British Library (and the other UK legal deposit libraries) the right to receive a copy of every UK electronic publication including blogs, e-books, and the entire UK web domain.

INTRODUCTION

The British Library (BL) is the national library of the United Kingdom and one of the world's greatest libraries. It is also most emphatically a library for the world. It has its origins in the former Library of the British Museum and it holds one of the most comprehensive collections of the world's knowledge. Its collection can be said to contain both the memory of the nation and also the DNA of civilization. The collection is at the heart of the unparalleled range of services that the BL provides to national and international users in reading rooms and exhibition galleries and through document supply and bibliographic services. The Library is active in its use of electronic services and digitization to provide effective and ever-wider access to its holdings. One of its main tasks is to collect, preserve, and provide access to the United Kingdom's National Published Archive. Significantly, new Legal Deposit regulations, which came into force on April 6, 2013, extended this remit into the digital domain and conferred on the BL (and the other UK legal deposit libraries) the right to receive a copy of every UK electronic publication including blogs, e-books, and the entire UK web domain.

HISTORY, FOUNDATION, AND FUNDING

The British Library Act 1972^[1] established the BL as the "...national library for the United Kingdom... consisting of a comprehensive collection of books, manuscripts, periodicals, films and other recorded matter, whether printed or otherwise." The Act charged the British Library Board with managing the Library as "...a national centre for reference, study and bibliographical and other information services, in relation both to scientific and technological matters and to the humanities" and with making its

services available "... in particular to institutions of education and learning, other libraries and industry."

The BL commenced operations in July 1973. While this was the first time that the United Kingdom as a whole had formally had a national library, the creation of this new body amalgamated a number of existing library institutions—each having a national remit—into a single administrative unit. Of these existing institutions, arguably the most notable was the library of the British Museum.^[2,3]

The British Museum had been founded by Act of Parliament in 1753. Prompted by the decision of Sir Hans Sloane, the eminent physician and scientist, to bequeath his large collections of books, manuscripts, drawing, antiquities, and natural history specimens to the nation, the foundation collections of the British Museum Library also included the Harleian Manuscripts collected by Robert Harley, the first and Earl of Oxford and his son Edward, and the manuscripts collection of Sir Robert Bruce Cotton. The Cottonian collection included such treasures as the Lindisfarne Gospels, the Cotton Genesis, and two of the four surviving copies of Magna Carta. One phrase in the British Museum Act of 1753 has a permanent relevance: "For publick use to posterity."

Sir Anthony Panizzi is generally credited with making the British Museum Library the great treasure-house that it became in his lifetime. An Italian émigré and patriot, he held a succession of positions: first assistant librarian (1831–1837), then keeper of printed books (1837–1856), and finally principal librarian and director (1856–1866). He was knighted in 1869. He argued "I want a poor student to have the same means of indulging his learned curiosity, of following his rational pursuits, of consulting the same authorities, of fathoming the most intricate inquiry, as the richest man in the kingdom, as far as books go..." It was his aim "to bring together from all quarters

the useful, the elegant and the curious literature of every language; to unite with the best English Library in England, or the world, the best Russian library out of Russia. . . and so with every language from Italian to Icelandic, from Polish to Portuguese.” Panizzi enforced the system of legal deposit, organized the production of the new catalogue, and oversaw the construction of the famous Round Reading Room of 1857 in the quadrangle of the Museum building to a design by Smirke. The current strength of the BL’s collections derives in no small part from Panizzi’s legacy.

The catalyst for the passage of the British Library Act had been the 1969 Report of the National Library Committee.^[4] Chaired by Dr F.S. Dainton (later Lord Dainton), the Committee had been tasked with “the examination of the various National Libraries, and, in particular, to consider whether these institutions should be brought together into a unified framework.” The Committee concluded that in the interest of efficiency and effectiveness the institutions should be integrated into a new authority. The other institutions that were amalgamated into the new national library in 1973/1974 were the National Reference Library of Science and Invention, the National Lending Library for Science and Technology, the National Central Library, the British National Bibliography Ltd, and the Office for Scientific and Technical Information. (Subsequently, in 1982, the India Office Library and Records also joined the BL, followed by the British Institute of Recorded Sound, later renamed the National Sound Archive, in 1983.) It was the amalgamation of these component parts that defined the compass of the new national library. As the 1971 White Paper put it, “*The objective of the British Library will be to provide the best possible central library services for the United Kingdom*”.^[5]

With respect to the breadth of the BL’s mission, Dame Lynne Brindley (the Library’s former chief executive) has argued^[6] that, as a national library, the BL is effectively “... *in a class of one, and continues to be unique, particularly in its wide scope of activities and services.*” The value that the BL brings is essentially threefold:

- It is a critical resource for UK research, it is an integral component of the national research infrastructure, and it plays a correspondingly significant role in ensuring the research excellence of the UK.
- It underpins business and enterprise through its contribution to knowledge transfer, creativity, and innovation.
- It is a world-class cultural institution with a vital role as a holder of the national memory.

Thus, the BL occupies a prominent place in the intellectual and cultural life of the nation. It is an integral component of the research infrastructure and it plays a correspondingly significant role in ensuring the research excellence of the United Kingdom and in supporting

creativity and innovation. An independent economic impact study^[7] commissioned by the BL in 2003 suggested that the total value added to the UK economy by the Library each year was £363 million, or £4.40 for every £1 of public funding. An updated study undertaken in 2013 confirmed that the Library generates a net economic value of £419 million for its users and UK society as a whole. The study showed that the benefit cost ratio had increased to 4.9 from 4.4 in 2003 and, accounting for value placed on the Library internationally, the benefit cost ratio was 5.1.

The early history of the Library from its foundation, and thus from the first edition of this encyclopedia, was characterized by an ever-closer fusion of its constituent parts, developed through a number of different structures, each of which moved the Library forward.

Full integration was achieved and most symbolically demonstrated by the opening of the Library’s purpose-built premises at St. Pancras in London by Her Majesty Queen Elizabeth II in June 1998 (Fig. 1). The building, designed by Sir Colin St. John Wilson, now stands as a confident symbol of the importance of *all* libraries to the nation’s cultural, scientific, educational, and economic success in the twenty-first century. However, its construction was not without controversy.^[8] HRH The Prince of Wales described the new BL as looking “more like the assembly hall of an academy for secret police.” A campaign was mounted by the Regular Readers Group seeking to retain reader facilities in the British Museum, notably the Round Reading Room and North Library. A 1994 Parliamentary Select Committee described the building as “an edifice that resembles a Babylonian ziggurat seen through a fun-fair distorting mirror.” And inquiries by the National Audit Office in both 1990 and 1996 were highly critical of the project management of the construction of the building, which was significantly delayed due to technical problems with the book shelving, with cabling damaged during installation, with shortcomings in the fire protection systems, and remedial works. The building finally opened to readers’ acclaim in December 1996, and the knighthood conferred on St. John Wilson in the 1998 New Year’s Honours list for services to architecture can perhaps be seen as constituting the final word on the architecture of the BL building.

At St. Pancras, the Library was able to consolidate services from 18 different buildings around London, including the move from the historic Round Reading Room at the British Museum, thus bringing humanities researchers to join their peers from the scientific disciplines in 11 new reading rooms (with 1200 reader places) covering all fields of research.

The Board has adopted a two-site estates strategy based on its headquarters building at St. Pancras and a campus site in Boston Spa, Yorkshire. In line with this strategy, construction of the BL’s new state-of-the-art Centre for Conservation, to the rear of the St. Pancras building, completed in spring 2007.

Fig. 1 BL's headquarters in St. Pancras, London, is a sleek, modern complement to the Victorian Gothic railway station alongside.

Boston Spa promises to be the site of future expansion because it offers both space and relatively cheaper building costs and, at the time of writing, construction of a major new collection storage building was well under way. This low-oxygen, high-density storage unit will employ a fully automated storage and retrieval system and have a capacity for 260 km of storage (ca 7 million items). The Library's newspaper strategy, which addresses the future consolidation of the newspaper collections currently held in a separate newspaper library in North London, envisages the storage of newsprint in an additional newspaper storage facility, adopting a similar technological solution, at Boston Spa with access via digital and microfilm surrogates at St. Pancras. The Library employs broadly 2000 staff at its sites in London and Boston Spa.

The British Library Board has adopted a two-site estates strategy based on its headquarters building at St. Pancras and its campus site in Boston Spa, Yorkshire. In line with this strategy, construction of the BL's Centre for Conservation, to the rear of the St. Pancras building, completed in spring 2007. The center, which was officially opened by HRH The Princess Royal in October 2007, provides a world-leading facility for book conservation and state-of-the-art technical facilities for the preservation of the Library's recorded sound collection. A program of behind-the-scenes tours is an important adjunct to the work of the center, enabling members of the public to see: conservation techniques ranging from manuscript repair using sturgeon glue to the digital processing of archival sound recordings. The center also offers a national and international internship program, the aim of which is to give interns the opportunity to work with the Library's experienced staff to gain skills and also confidence in what they are doing.

Boston Spa promises to be the site of future expansion for the BL because it offers both space and relatively

cheaper building costs. During the last decade the Library has taken significant steps to improve the quality of its collection storage facilities for the ever-growing physical collection and the progressive concentration of the Library's collection. December 2009 saw the opening of a major new £26 million storage building for printed books at Boston Spa (and as a consequence the vacation of three leasehold outhouse storage buildings in London). This new storage facility at Boston Spa provides capacity for ca.7 million items (the equivalent of 262 linear kilometers of traditional shelving) in high density, preservation standard storage, with fully automated retrieval systems operating in a low-oxygen environment, and growth space for the next decade. This automated, high-bay, high-density solution is used frequently in warehouse management but rarely in archives and libraries, and its size and characteristics make it one of the most remarkable library buildings in the world. Collection moves of low-use stock into the new facility began in January 2009 and completed in early 2012.

At the time of writing, construction of another major new collection storage building also on the Boston Spa site—for newspapers—had just completed (Fig. 2). This new Newspaper Storage Building will hold the BL's newspaper collection in the best of archival conditions and permit the vacation of the Library's Colindale facility in North London, home of the newspaper collection since 1905. The new facility will store the equivalent of 33 linear shelf kilometers of newspaper content. Like the Additional Storage Building, the store has a fully automated retrieval system and full temperature and humidity control, and it will enable the BL's print newspaper collections to be kept in archival-standard conditions for the first time ever. Temperature in the storage void is held at a constant 14°C (+/- 1°C) and relative humidity at 52%.

Fig. 2 BL's new Newspaper Storage Building under construction at Boston Spa in 2014.

To eliminate fire risk, oxygen levels in the void are reduced to 14.9vol% by continuously introducing nitrogen. The construction of this new storage building is one element of the BL's newspaper strategy. Newspapers are an immensely rich source for research but they deteriorate quickly because of the poor quality of the paper they are printed on and it is crucial that they are properly preserved for future generations. The Library's ambition is to digitize the best of its historical collections, to open up the collections, and to make them much more widely accessible on the web.

The Library employs broadly 1600 staff at its sites in London and Boston Spa.

The Library's funding comes mainly from UK central government, through the vote of the Department for Culture, Media, and Sport. (At the time of writing the balance of the Library's incoming resources is annually in broad terms: grant-in-aid of £95 million, supplemented by the Library's trading income of £14 million, primarily from document supply services, and a further £15.6 million from donations, grants from foundations, and similar forms of support.)

STRATEGY AND USER COMMUNITIES

In September 2010, following a year of extensive research and consultation with stakeholders and experts from the fields of technology, information, publishing, libraries, the

media, learning, and research, the BL published its *2020 Vision*,^[9] setting out its priorities and aspirations for the next decade. The *Vision* highlighted what the Library considered was likely to be the key trends and opportunities over the next 10 years, indicating how the BL planned to take advantage of those opportunities to remain a great national library and a major hub of the global information network. And the *Vision* also provided a long-term perspective on where the information world and the Library was heading and the strong sense of direction that would be needed, particularly during the subsequent years of financial constraint.

The experts consulted by the Library provided a range of views on what the world of 2020 would look like. These predictions included the following:

- Technology will be in a constant state of beta—rapidly changing and, by 2020, resulting in a very different environment from today.
- The new generation of “digital natives” will enjoy wider access than ever to a huge range of online content in all formats; they will assume that *everything* is available on the web—an incorrect assumption, as even by 2020 a huge amount of legacy content will remain undigitized.
- The online landscape will increasingly resemble the *semantic web*—in which computers become capable of extracting, classifying, and analyzing data to create context from content.

- The business models underpinning scholarly publishing will change dramatically—more teaching, learning, and research will take place virtually and multi- and interdisciplinary research will continue to grow in importance.
- Knowledge institutions will need to reposition themselves, demonstrating the distinct value they add to the knowledge economy.

Our mission and 2020 Vision

Our mission: Advancing the world's knowledge

Our vision: In 2020, the BL will be a leading hub in the global information network, advancing knowledge through our collections, expertise, and partnerships, for the benefit of the economy and society and the enrichment of cultural life.

Our vision is supported by five key themes which set out the strategic priorities for the Library:

1. Guarantee access for future generations
2. Enable access for everyone who wants to do research
3. Support research communities in key areas for social and economic benefit
4. Enrich the cultural life of the nation
5. Lead and collaborate in growing the world's knowledge base

In February 2011, the Library published *Growing Knowledge: the British Library's Strategy 2011–2015*,^[10] which set out how the Library intended incrementally, to move toward delivering its 2020 Vision over the period. The strategy recognized that all five strategic priorities were valuable in that they would enable the Library to support a wide range of users, with varied needs; however, in a period of financial constraint, efforts would need to be focused on essential activities. Therefore, in its strategy, the Library attached greatest weight to those activities relating to its statutory remit to make accessible the nation's and the world's store house of recorded knowledge, both now and in the future. Thus, its key implementation priorities for the period were to

- Achieve regulations enabling implementation of the Legal Deposit Libraries Act 2003
- Manage the ingest and storage of voluntary and legal deposit content
- Develop the Library's digital infrastructure
- Open a state-of-the-art facility for storage of physical newspapers
- Develop selective collaborative stewardship arrangements to collect and connect to content
- Digitize up to 20 million pages from the Library's newspaper collection in partnership with brightsolid

- Establish, in partnership, at least one major new large-scale digitization initiative in addition to the newspaper digitization initiative
- Obtain agreements from publishers to provide access to licensed materials off-site through a range of models

The Library's users come from diverse backgrounds, span all disciplines, and have varied needs. The Library defines its broad audience communities as follows:

- Researchers
- Business people
- The library network
- Schools and young people
- The general public

The BL is a great historic institution, with a critical mass of its own and a vibrant international brand. However, it is not an island. In caring for and managing its collection, and in providing access, it seeks to work productively with a range of partners where there is a demonstrable mutual benefit. And the absence of a unitary governance, policy, and funding structure within government for library provision nationally places a particular onus on the libraries themselves to collaborate both within and across sectors. Some notable examples of collaborative projects led by the Library follow.

The UK Research Reserve (UKRR) is a collaborative distributed national research collection managed by a partnership between the higher education sector and the BL. It allows higher education libraries to deduplicate their journal holdings of a title if two copies are held by other UKRR members, ensuring continued access to low-use journals, while allowing libraries to release space to meet the changing needs of their users. With funding from the Higher Education Funding Council for England (HEFCE), it has the target of releasing 100 km of shelf space by 2015 and to date has achieved £37 m in savings through eliminating the need for duplicated storage in the system.

Electronic Theses Online Service (EThOS) is the national aggregation service for UK PhD theses, provided by the BL. It aims to transform the visibility and availability of this previously rarely used resource: It demonstrates the quality of UK research and supports the UK Government's open-access principle (see the following text) that publications resulting from publicly funded research should be made freely available for all researchers, providing opportunities for further research. Currently, EThOS contains 350,000 records relating to theses awarded by over 120 institutions; around 120,000 of these also provide access to the full text thesis, either via download from the EThOS database or via links to the institution's own repository. Of the remaining 250,000 records dating back to at least 1800, three quarters are available to be ordered for scanning through the EThOS digitization-on-demand facility.

The British Library's Business & Intellectual Property Centre (BIPC) provides access to world-class business and

intellectual property information and expertise under one roof. The Library's information resources—which include market research reports, up-to-the-minute company and financial information, and patent and trademark databases—effectively give small businesses access to the same quality and depth of resources as those of a large multinational. The information is supplemented by free or highly discounted workshops, one-to-one clinics, mentoring, and networking events all designed to inspire people and to teach them the skills they need to set up and run a business. Since it was set up in 2006, it has welcomed over 350,000 people through its doors and has helped to create over 2,700 businesses. Now, in a joint project with the UK Intellectual Property Office and six major English city public libraries, the Library is extending the successful BIPC model across the country by establishing a cobranded network with one-stop shop centers for small businesses and entrepreneurs in the city libraries of Birmingham, Leeds, Liverpool, Manchester, Newcastle, and Sheffield. Once up and running, the six centers will provide direct advice and guidance to over 25,000 people and will create over 500 businesses and 1,000 jobs each year.

COLLECTIONS AND SERVICES

The BL is unique among national libraries for the breadth and richness of its historic collections. The Library's collection is one of the largest in the world, holding over 150 million items in all known languages and formats, including books, journals, newspapers, magazines, sound and music recordings, patents, databases, maps, manuscripts, stamps, prints, drawings, and much more. Based on entries in catalogues, the Library's collection size^[11] is calculated as given in the following table:

Monographs	14,768,923
Serial titles	858,414
Manuscripts	370,396
Newspapers (titles)	52,000
India Office Records	413,801
Philatelic items	8,280,939
Cartographic items	4,574,521
Music scores	1,618,761
Sound disks	1,531,844
Sound tape items	256,867
Digital audio files	74,318
Videos	39,983
Digital video files	23,638
Prints and drawings	33,210
Photographs	323,039
Patents	68,634,309
Reports in microform	10,433,593
Theses	269,442
Total	112,505,998

In the field of arts and humanities, the BL holds the world's largest collections of western and oriental manuscripts (including substantial archives) and unrivalled collections of British printed books from 1476 to the present date, of European printed books from 1455 to date, and of Asian and African printed books dating back to the origin of printing in these areas. In addition the Library holds substantial collections of sound recordings of oral history and of recorded sound relating to English language and literature. The chief historic components of these collections are the library of the British Museum, collected since its foundation in 1753. Of special importance for arts and humanities are the collections that came with the India Office Library and Records (incorporated in 1982), ranging from the foundation of the East India Company in 1600 to Indian independence and with the British Institute of Recorded Sound (incorporated in 1983). Holdings include material over 3,000 years old (Chinese oracle bones), 310,000 manuscript volumes ranging from Leonardo da Vinci's Notebook to Harold Pinter's archives, *Magna Carta*, Lindisfarne Gospels, the first edition of the Canterbury Tales, Tyndale's translation of the New Testament, the most recently published British books, and the recording of Nelson Mandela's Rivonia trial speech.

The BL houses one of the foremost collections of scientific, technical, and medical literature in the western world. Its contemporary collection of modern scientific literature includes all subject areas and disciplines and includes materials in many formats including journals, research-level monographs, conference proceedings, reports, and electronic reference materials. The Library estimates that there are approximately 3.45 million volumes of print serials and monographs in the collection.

The Library's collections in the field of social sciences reflect the full history of official publishing in the United Kingdom and its constituent parts. The Library has 12,000 volumes of House of Commons sessional papers from the nineteenth and twentieth centuries, containing more than 185,000 parliamentary papers. There are 2400 volumes of UK parliamentary debates, all available on open shelves in the Social Sciences Reading Room. Government publications from across the world include records of legislatures, censuses, and other official statistics. The Library has all print communications from the United Nations, the European Union, and the Organisation for Economic Co-operation and Development as well as other intergovernmental bodies such as the World Bank. Collecting from around the world covers economic, political, social, and cultural development and includes many rare items. The Library's collections of trade literature and market research are among the most comprehensive in the world, including over 66 million patent specifications from across the world.

The BL's acquisitions budget in the year 2013–2014 on collection items (for material of research value) was £14.6

million. Research undertaken a few years back as part of the Research Support Libraries Group (RSLG) project underlined the critical importance of the BL's reference and document supply collections in underpinning the resources of the libraries of the higher education institutions of the United Kingdom. When the budgets for acquisitions in UK institutions were ranked against those in the United States, the BL's acquisitions spend was found to be on a par with the best U.S. research collections at Harvard and Yale. However, the highest ranking UK institutions not in receipt of legal deposit (Manchester, John Rylands) were ranked at the 83rd place and, more significantly, the last 85 places out of 221 were taken up by UK universities. The RSLG report^[12] observed:

"Researchers gain access to external hard copy resources in two ways: remotely via inter-library loan or document supply; and directly by visiting other institutions in person. Inter-library loan and document supply in the UK is deeply entrenched and effective.... The resources of the British Library are, we believe, one of the main reasons why UK universities are able to match, and in many cases exceed, the quality and scale of research undertaken within similar-sized universities in other parts of the world. Comparisons with North American universities, for example, show that only three UK libraries—the British Library and the university libraries at Oxford and Cambridge—acquire material on a scale comparable with the leading North American private or state universities. A large research intensive university in the UK typically acquires some 10,000 serials annually along with some 30,000 monographs—respectively about a quarter and a half of what the main Carnegie Research 1 universities in the USA, with which they would wish to be compared in the breadth and quality of their research, acquire."

Since then the information world has continued to change rapidly. Technology has improved, user expectations have increased, and publisher business models have changed. The BL's current content strategy, *From stored knowledge to smart knowledge*,^[13] has responded to the unprecedented scale of these changes and has adopted a number of key principles, the most relevant of which in this context are as follows:

- The UK's publications received through Legal Deposit will underpin content development.
- We will select content in terms of its research value.
- Connecting to content will become more important.
- We will continue to invest in heritage materials.
- We will conduct a strategic review of the acquisitions budget (in the context of changing levels of provision in the UK HE and public library sectors).
- The Library will continue to make the print-to-digital transition.
- We will add value to content through curation and encourage our users to add value through community.

- The Library will develop a "without walls" approach to access.

The importance attached by the Library to heritage acquisitions is reflected by the budget it has established for purchasing such items, equivalent in broad terms to about 10% of the Library's total grant-in-aid-derived acquisitions budget. This is supplemented by a number of BL trust funds, the largest of them in terms of endowment being the Shaw Fund, although, for an institution that has been going for 250 years, the Library does not have huge endowments. Heritage assets purchased by the Library in 2013–2014 were valued in aggregate at £2.7 million. In recent years, the Library has been fortunate to acquire a number of very significant acquisitions. Notable among these have been

- The literary archives of JG Ballard, Harold Pinter, Ted Hughes, and Mervyn Peake
- The photographic collections of William Fox Talbot and Fay Godwin
- The Dering Roll, the oldest extant English coat of arms, the Macclesfield Alphabet Book, a rare medieval *pattern* book, and an illuminated medieval prayer roll that once belonged to Henry VIII
- The seventh century St. Cuthbert Gospel, the oldest intact European book

The most essential task of national libraries, and the one that more than any other makes them what they are, is that they are responsible for acquiring, preserving, and making accessible the publications—of all kinds—of the country. Therefore, it follows that legal deposit—the objective of which is to build a collection of the national literature—must be of fundamental importance. New regulations (the Legal Deposit Libraries [Non-Print Works] Regulations 2013) came into force on April 6, 2013, giving the BL and the five other UK Legal Deposit Libraries (the National Library of Scotland, the National Library of Wales, Bodleian Libraries, Cambridge University Library, and Trinity College, Dublin) the right to receive a copy of every UK electronic publication. The Regulations enable the six libraries to collect, preserve, and provide long-term access to the increasing proportion of the nation's cultural and intellectual output that appears in digital form—including blogs, e-books, and the entire UK web domain. The Legal Deposit Libraries Act 2003 had established the principle that legal deposit needed to evolve to reflect the massive shift to digital forms of publishing: the 2013 Regulations finally made digital legal deposit a reality. This had been long sought by the legal deposit libraries, concerned there was a very real danger of a digital "black hole" opening up in the nation's memory, and was a tremendously important step forward, ensuring that the fullest possible record of life in the United Kingdom in the twenty-first century is collected and preserved for future generations of researchers.

On behalf of the Legal Deposit Libraries, the British Library is archiving copies of freely accessible UK websites and web pages from the open web, using an automated crawling or harvesting process. A “snapshot” of every website within scope, currently estimated at circa 4.8 million active sites, will be archived at least once a year. Some 200–500 websites within scope will be archived on a more frequent basis—such as quarterly, monthly, weekly, or even daily—in order to ensure that rapidly changing or updated content is archived adequately. Such websites will be selected by the Legal Deposit Libraries for their importance and research value, with the crawl frequency being adapted to the circumstances and nature of the content. And in addition, the Legal Deposit Libraries will crawl other selected websites in order to develop “special collections.” Perhaps four or five new collections will be developed each year for important events (which may involve crawling specific websites relatively frequently for a limited period) or important themes (which may involve crawling selected websites regularly over a longer period). By the end of March 2014, the BL had 140,000 E-journals available to access in its reading rooms and approximately 1.3 billion URLs were also available as a result of crawls of the .uk domain.

The Library’s new £15 m purpose-built Centre for Conservation, funded by Government, the Library, and through fundraising, hosts state-of-the-art conservation studios, a visitor center linked to the main exhibition galleries, public demonstrations and tours, and improved conservation treatments and skills for the current cohort and new training courses for future book conservators (including a new foundation degree in book conservation with a university partner).

The Library’s collection of reference materials, spanning four millennia and covering every written language, is one of the richest and the most comprehensive available to scholars. It is housed primarily in St. Pancras and serves the 11 reading rooms there (Figs. 3,4). Two other reading rooms are located in Boston Spa and in the newspaper collections building in North London. Access to the reading rooms is free—the Library welcomes everyone who wants to do research, whether for academic, personal, or commercial purposes—and, currently, Reader Passes are held by over 150,000 readers. While the reading rooms in St. Pancras are essentially interdisciplinary, they are broadly grouped into humanities on the one hand and science, technology, and business on the other. In addition, certain types of material—Manuscripts, Maps, Rare Books and Music, and Oriental and India Office Collections—each have a dedicated reading room. March 2006 saw the opening of the Library’s Business & IP Centre at St. Pancras. The Business & IP Centre is designed to support small and medium-sized enterprises and entrepreneurs from that first spark of inspiration to successfully launching and developing their business.

April 2014 saw the opening of the new British Library *Newsroom*, at St. Pancras. The *Newsroom* is an integrated news and media offering—as opposed to simply a newspaper reading room—combining print and microfilm news content (transferred from Colindale) with newly created Television News Recordings from the Library’s video server, with radio news, and importantly with web news collected under the Non-Print Legal Deposit Regulations introduced in 2013. The facilities of the Newsroom include

- More than 100 desks in a spacious and newly refurbished Reading Room at the heart of the BL at St. Pancras
- 40 digital microfilm viewers, offering excellent image quality and magnification, and swift, intuitive navigation—opening up microfilm to a new generation of researchers
- Microfilm of the 15 most highly used newspaper titles available instantly on open-access shelves in the Newsroom, the rest of the microfilmed archive—some 630,000 reels—available to order within 70 min
- Free access to digitized resources such as the British Newspaper Archive, which has 7.8 million scanned pages of historic newspapers, fully searchable by date, title, and keyword
- A public networking area for meeting, discussion, and collaborative research, including a large video wall displaying live news feeds and news-related Library content
- Access to the UK Web Archive, including 4.8 million archived UK domain websites, totalling more than a billion individual URLs
- The BL’s extensive collection of TV and radio broadcast news—including over 40,000 programs, and growing at a rate of 60 hr every day across 22 news channels

The Library’s reading room at Boston Spa was also refurbished during 2014 and now has facilities for news research broadly to match those at St. Pancras.

The Library’s document supply collection is housed mainly in Boston Spa and is used in university and public libraries and top research companies both in the United Kingdom and overseas (Fig. 5). In recent years, the majority of document requests have been met by photocopies, but increasingly, researchers are being given instant access to articles and papers in electronic form as the Library develops relationships with the publishers.

In 2013–2014 the number of items supplied/consulted remotely and onsite was 10.5 million.

For the general public, the Library’s building at St. Pancras provides modern facilities and galleries (Fig. 6). The centerpiece of the public space is the King’s Library, housed in a magnificent glass and bronze tower (Fig. 7). The 65,000 volumes of King George III’s collection were

Fig. 3 Humanities Reading Room, St. Pancras.

presented to the nation by George IV in 1823 and continue to be used by researchers every day.

Access to, and enjoyment of, the collection is also extended by a vigorous public program, both onsite and remote. At St. Pancras there is an exciting portfolio of free and charged public exhibitions, targeted at the broadest possible global audience, one that is notably diverse in culture, language, and styles of learning. The Sir John Ritblat Gallery of Treasures of the BL houses a permanent display of the jewels of the national collection. These include historic documents such as Magna Carta, icons of English literature including the Beowulf manuscript and the notebooks of the Brontës, and the sacred texts of the world's great religions. Imaginative access to a number of these, including the Lindisfarne Gospels, the Golden Haggadah, the Diamond Sutra, and Sultan Baybars' Qu'ran, is provided by Turning the Pages, a touch-screen system

developed by the Library to give visitors the opportunity to turn the pages of digital facsimiles, explore them in magnified detail, and hear or read about their production and meaning. In selecting items for exhibition, care of the collection is a paramount consideration; for example, the Library has recently introduced a rotation policy for its most iconic items, to ensure that they are rested for six months after an eighteen month period of display.

The Library plays host to two new major temporary exhibitions every year. Some recent notable examples include *Sacred: Discover what we share* (2007), which displayed some of the world's earliest and most important religious texts from the Jewish, Christian, and Muslim faiths, and *Taking Liberties: The struggle for Britain's freedoms and rights* (2008), which attracted some 100,000 visitors to see treasures including Magna Carta, the death warrant of Charles I, and the prison diary of suffragette

Fig. 4 Oriental and India Office Reading Room, St. Pancras.

Olive Wharry. Both of these exhibitions placed the visitor at the heart of current debates: in the former case exploring commonalities, crossovers, and contrasts between the three Abrahamic faiths and in the latter around rights and freedoms devolved government and free speech. Both of these exhibitions were accompanied by award-winning educational programs and enhanced by rich interactive displays. They are also accompanied by programs of public lectures, debates, readings, and performances, both in the building

and on the piazza, which bring new audiences to the Library, and raise awareness of its collection.

The Folio Society Gallery in the Library's Entrance Hall plays host to four special themed exhibitions each year and attracts audiences of around 180,000 visitors per annum. Examples include the following: *Poetry in Sound* (June 2013) celebrated the centenary of the birth composer Benjamin Britten, and *Beautiful Science* (February 2014) explored how the visualization of scientific data is crucial

Fig. 5 The British Library site at Boston Spa, Yorkshire, is the operational center for international document supply and bibliographic services.

Fig. 7 The tower of the King's Library, St. Pancras.

for making new discoveries and for communicating those discoveries effectively.

Other public spaces at St. Pancras include the Piazza, with sculptures by Sir Eduardo Paolozzi and Antony Gormley, and the conference center's auditorium and meeting rooms, which give the Library flexible space to mount events, conferences, and activities for a wide range of audiences.

Closely allied to the public program at St. Pancras is a program of regional outreach and cooperation with the UK public library network. Turning the Pages™ is included in the Library's complementary virtual learning environment, the Online Gallery, along with views of current and past exhibitions, and short research articles by our experts. The Library's learning program promotes the development of young people's research skills and engagement by schools and lifelong learning audiences with world culture and heritage. The Library's onsite program comprises workshops, exhibition activities, and major educational projects with schools, further education colleges, and youth and community learning groups, and public activities meet appropriate learning and access criteria.

Digitization has enabled significant numbers of collection items to be made available for a range of audiences—scholarly, school-based, commercial, or the wider public—by varying the routes into the material and the levels of interpretation provided. The Library's digitization programs, developed through a mixed approach of public and private sector funding, include major collaborations such as the International Dunhuang Project (IDP). This project is bringing together on the web a collection of thousands of Chinese manuscripts and early printed material that was dispersed a century ago from caves on the Silk Road trading route. The image bank, catalogue, and other resources promote in-depth study and establish a new paradigm for the fostering of knowledge in the digital environment by linking the collections and expertise of the BL to those of the National Library of China, the Bibliothèque nationale de France, the Institute of Oriental Studies, St. Petersburg, the National Museum, New Delhi, the Staatsbibliothek, Berlin, and other partners.

Unlike some other national libraries, the BL has not been allocated additional funding to enable it to undertake large-scale digitization. Therefore, while this has remained the case and in order to maintain the Library's core functions, the Board as a matter of policy has not allocated grant-in-aid funds toward digitization; instead, the Library has actively sought alternative forms of funding—for example, by charitable donation, sponsorship, or commercial partnership—to take this work forward on a project-by-project basis. The precise terms of funding and hence access necessarily differed between projects. Key initiatives that have significantly contributed to building critical mass include the following:

Nineteenth century books: In partnership with Microsoft, the BL commenced mass digitization of nineteenth

century out-of-copyright books with an initial focus on English Literature materials. The project digitized 65,000 titles in total (25 million pages) of nineteenth century philosophy, history, poetry, and literature.

Eighteenth and nineteenth century books: In June 2011, the BL and Google announced a partnership to digitize 250,000 out-of-copyright books (40 million pages) from the Library's collections. Selected by the BL and digitized by Google, both organizations are working in partnership to deliver this content free through Google Books (<http://books.google.co.uk>) and the BL's website (www.bl.uk). Google are to cover all digitization costs. This project is to digitize a huge range of printed books, pamphlets, and periodicals dated 1700–1870, the period that saw the French and Industrial Revolutions, the Battle of Trafalgar and the Crimean War, the invention of rail travel and of the telegraph, the beginning of UK income tax, and the end of slavery. It will include material in a variety of major European languages and will focus on books that are not yet freely available in digital form online.

Newspapers: In 2010, the Library announced a Public–Private Partnership initiative to digitize up to 40 million pages from the BL's national newspaper collection in partnership with brightsolid online publishing, the owner of online brands including findmypast.co.uk and Friends Reunited. This 10 year agreement is set to deliver the most significant mass digitization of newspapers the United Kingdom has ever seen, making large parts of this unparalleled resource available online for the first time. There are no direct digitization costs to the BL as brightsolid is to create a commercial offering and assume the associated financial risks. The resource will be available for free to users on-site at the BL and copies of all scanned materials will be deposited with the Library to be held in the national collection in perpetuity. The Library had previously made over 4 million digitized pages of pre-twentieth century newspapers—the output of a JISC-funded digitization program—available to UK Higher and Further Education Institutions.

Sound: Also in conjunction with the JISC, the BL has digitized portions of its substantial holdings of sound material amounting to 50,000 individual recordings and 7,500 hr of sound available (music, drama and literature, oral history, wildlife, and environmental sounds).

The national library of the United Kingdom is also most emphatically a library for the world. The British Library Board's international engagement strategy places a focus on collaboration and partnership, professional leadership and engagement, and cultural diplomacy. Under the terms

of the strategy, five key strands of international activity are being pursued: restoring and sustaining cultures, virtual reunification of collections, capacity building, strategic partnerships, and international professional leadership. The Library's priorities for international engagement at the current time place a focus both on India and China, and also on digital developments in its professional leadership activities. The Library has attracted £10m from the Lisbet Rausing Charitable Fund (now the Arcadia Fund) to administer an Endangered Archives Program, seeking to identify archival materials at risk in the developing world, to arrange their transfer to a safe archival haven in the country or region of origin, and to create surrogate copies for distribution by the Library. The Library continues to play its full part in the international professional bodies, including the International Federation of Library Associations (IFLA), the Conference of Directors of National Libraries (CDNL), and the Conference of European National Librarians (CENL).

Structure

Library policy and strategy is set by the British Library Board, which, under the terms of the British Library Act, comprises 13 members, under the leadership of a part-time nonexecutive chairman. In selecting members for the Board, the Act charges the Secretary of State with giving preference to "those who have knowledge and experience of library or university affairs, finance, industry, or administration". The chief executive is a member of the Board.

The Library is currently structured on the basis of four divisions: collections, operations, audiences, and finance. The directors of these divisions, together with the chief executive and the chief digital officer, form the executive leadership team of the Library, with responsibility for its day-to-day running.

Collections

The collections division is responsible for nurturing in-depth expertise and understanding of the collections and for developing policy for and managing the areas of collection development, description, and conservation. It is a major center of global excellence in collection expertise and management, uniting the Library's curatorial and conservation specialisms and also digital preservation.

Operations

The operations division is responsible for operating the services derived from the Library's collections. It is responsible for those services however they are delivered, whether in reading rooms or remotely through document supply. Divisional responsibilities also encompass IT delivery, human resources, and organizational development.

Audiences

The establishment of an audiences group reinforces both the importance of the Library's users at the heart of its strategy and also its commitment to understanding and reaching new audiences as well as serving its key constituencies. The division is responsible for the public profile of the Library, in its widest sense, and comprises the press office, public relations, exhibitions, publishing, and events, and senior staff head the marketing and communications activity to each of the Library's key audiences—researchers in higher education, business users, the library and information network, education, and the general public.

Finance

The finance division is responsible for not only the estates strategy of the Library but also the financial control of an annual spend, comprising both grant-in-aid and earned income, in the region of £120 million per annum, as well as corporate procurement, security and risk management, portfolio management, and corporate planning.

Outside the divisional structure, but within the executive leadership team, the chief digital officer is the most senior technology executive in the organization, tasked with influencing corporate strategy at the highest level to keep up the momentum and ambition of the Library's digital transformation, coordinating digital investment across the organization as a whole, setting consistent standards of architecture and metadata, and offering independent internal challenge and review.

CONCLUSION

The BL, in terms of its collections and the range of services that are derived from them, is the world's greatest research library. The Library is at one and the same time a world-class cultural institution with a vital role as holder of the national memory, a critical resource for UK research, an integral component of the national research infrastructure, and playing a correspondingly significant role in ensuring the research excellence of the United Kingdom, and it underpins business and enterprise through its contribution to knowledge transfer, creativity, and innovation. The digital information revolution has posed new challenges to the library profession and offered new opportunities. The BL is responding confidently to the new imperatives. Forty years ago the BL's founders sought to create a national library to serve the world. The Library is now achieving this in ways that its founders may not have envisaged but must certainly welcome.

FURTHER INFORMATION

The Library's website, www.bl.uk, gives details of services and collections and provides access to a wide range of digital resources.

The BL can be contacted at 96, Euston Road, London, NW1 2DB, United Kingdom.

Business Informatics

Markus Helfert

School of Computing, Dublin City University, Dublin, Ireland

Abstract

The rapid changes in recent years demand constant evaluation and modification of education programs. The following contribution summarizes some aspects of current study programs in information systems (IS) and focuses on business informatics (BI). As a stream of IS, BI can be described as a method and model-centered approach focusing on business IS. The success of BI derives from the benefits that arise when business administration concepts are combined with computer science technologies and software engineering principles to form a coherent methodological approach. In addition, addressing the need for an innovative and cross-disciplinary study model to equip graduates with transformation skills we have developed a master's study program in BI. By discussing an example curriculum, this entry outlines the core elements of this program and gives direction for BI as a study domain.

INTRODUCTION

Many universities have offered various programs related to information systems (IS). However, the rapid changes in recent years demand constant evaluation and modification of education programs. Recent challenges include for instance the move toward programs, which are more applied and professionally orientated. The Bologna Declaration in Europe with its three-level study structure as well as the increasing pressure to ensure funding within most departments adds further pressure to many universities. Despite attempts being made to provide reference to curricula and guidelines, many universities and faculties struggle with the proper direction and design of the IS curricula.

Common reference curricula related to IS are, for example, the IS 2002: Curriculum Guidelines for Undergraduate Degree Programs in Information Systems; and the MSIS 2000: Model Curriculum and Guidelines for Graduate Degree Programs in Information Systems.^[1,2] Although proposed for many years, several discussions and disagreement exist on the content and direction of IS curricula and IS as a discipline. Recently a joint task force of the Association for Computing Machinery and Association of Information System is aiming at revising the IS 2002 undergraduate curriculum.^[3] At the same time we are experiencing decreasing enrolments in IS programs worldwide.^[4]

In order to summarize aspects of current study programs in IS we focus on business informatics (BI). This entry aims to illustrate differences between BI and traditional IS study programs.^[5] We structure the entry as following. First, we summarize the context of information technology (IT)- and IS-related study programs. Then we outline the main characteristics of BI. In addition, we provide a generic framework for IS study programs. Finally, we present an overview of an example study program in BI—the European M.Sc. in Business Informatics

at Dublin City University. We conclude the entry by outlining some key challenges of BI as a study domain.

CONTEXT OF IS STUDY PROGRAMS

One of the IS-related challenges at present is the increase in complexity and the growing interdependency between business aspects and IT. Organizational components like business strategy, rules, procedures, and processes, and the organization's application systems, including hardware, software, and databases, affect and influence each other. Any change in one of these components typically requires modifications in other components, whereas existing systems and structures often act as a constraint on organizations. As a consequence, the demand for graduates capable of analyzing complex information networks and project managers managing large IT projects is expected to increase. Therefore such subjects as application integration, enterprise architecture, information management, and business process management are increasingly important.^[6] In addition, claims that IT is no longer a source of strategic advantage, indicates the move from technology-orientated jobs to more business-orientated roles. Universities are expected to provide in addition to core knowledge of IS' design and implementation a broad business and real-world perspective.

Graduates should show strong analytical and critical thinking skills as well as interpersonal communication and team skills. A further necessary area of expertise for today's IT graduates is the International environment. In a decade that has seen the enlargement of the European Union and that globalized it, it is necessary for business and IT personnel to be competent to work in other countries and to work in multicultural teams. Graduates may need to understand how to manage geographically and

ethnically diverse teams. Therefore, students should gain practical experience of studying and working abroad, by which they will be exposed to the business culture of another country. Spending time in another country offers many advantages: a chance to acquire new skills, to participate in multicultural teams, and to experience the benefits of cultural diversity.

BI AND IS

Traditionally universities focused on management and business studies as well as computing, software engineering, and computer science. Computing and computer science (e.g., basic informatics) addresses technical and theoretical bases of IT and software systems. Business and management provide knowledge of the principal functions of management and focus on business operations and decision making (behavioral and organizational component). The combination of both disciplines, which includes technical and social components, is generally described as IS. Terms such as management information systems (MIS), business information systems (BIS), or information systems and management (ISM) are also common.

Besides these courses, over the last decades a growing number of universities, particularly in central and northern Europe, are offering undergraduate and postgraduate degrees in *business informatics*. The term seems well established in the German-speaking countries; however is often considered controversial. Indeed, BI stems from the literal translation of the German term “Wirtschaftsinformatik,” but there seems a controversy about the characteristics of BI. BI is sometimes assumed to be equal to the broad area of IS, though some indications exist that BI has a stronger emphasis on engineering principles and methods.^[7] In order to provide a foundation and to frame the subject in the IS discipline, in the following we outline the characteristics of BI.

Management-orientated IS programs sometimes lack consideration of a *methodological* combination of the theoretical work of computer science with a practical orientation toward designing systems and applications. This methodological focus is the area of BI, which complements traditional areas of IS that focus on *explaining* real-world scenarios. BI aims to engage constructively to develop solutions tailored to business problems. It takes an active role in aligning business strategy, corporate goals, business processes, and IT. The core element of BI is a methodological approach to describe, explain, predict, and design information and communication systems. It involves the development of terminologies, models, and architectures that are explicit and sharable.

BI can be characterized as

- Interdisciplinary.^[8]
- Focusing on business IS as socio-technical systems comprising both machines and humans.^[9–12]

- Concerning the inception, development, implementation, maintenance, and utilization of business IS.^[13,14]
- Describing the relationship between humans, business functions, information, and communication systems, and technology.^[15]

BI can be summarized as a socio-technological and business-orientated subject with *engineering* penetration.^[13] As a science discipline BI is categorized as

- Applied science that studies real-world phenomena.
- Formal science that creates and applies formal description methods and models.
- An engineering discipline that systematically designs and constructs information and communication systems.^[11]

The success of the subject derives from the benefits that arise when business administration concepts are integrated with computer science technologies and software engineering principles to form a coherent methodological approach. It centers on IS architectures and business processes and provides a systematic design and construction of organizational information and communication systems.

BI Subjects

In the following we present a framework for BI and IS for which we amalgamated prominent curriculum guidelines; an undergraduate and a graduate model curriculum predominantly referred to in the Anglophone area with one frequently referred reference curriculum in the German-speaking area.

- The model curriculum and guidelines for graduate degree programs in IS (*MSIS 2000*).^[1]
- The most recent version of the IS undergraduate model curriculum (*IS 2002*).^[2]
- The recommendation for BI at universities (*BI recommendation*).^[8]

The work of IS model curricula represent almost 30 years of experience in curriculum development. Started in the early 1970s by the Association for Computing Machinery (ACM) other organizations, including Data Processing Management Association/Association of Information Technology Professionals (DPMA/AITP), International Federation for Information Processing (IFIP), and Association for Information Systems (AIS), have aided model curriculum development. The IS 2002 model curriculum is the most recent version for an undergraduate IS curriculum, published by the ACM and AIS. IS 2002 includes detailed course descriptions and prescriptive advice on how to offer an IS undergraduate degree program. For our study we used the most recent version of the IS 2002

undergraduate curriculum, although the current version is currently reviewed by a joint ACM/AIS task force. The MSIS 2000 model curriculum was published by ACM and AIS as a guideline for master degree programs in IS. On a master's level, the curriculum is designed to accommodate students from a wide variety of backgrounds. It considers a set of interrelated building blocks including foundational skills, core subjects, integration subjects, and career tracks. Emphasizing on career development skills, the curriculum includes oral, written, and presentation skills; people and business skills; ethics and professionalism.

The model curricula are explicitly developed to include knowledge elements from three major computing disciplines: computer science, software engineering, and IS. It accumulates long experience in IS curriculum development and provides a coherent structure for a study program in IS. Thus these model curricula seem to be appropriate, even though the model curricula are primarily based on the educational system and degree structures common to the United States and Canada, with limited acceptance and use outside of this area. The two-level educational structures underlying the curricula proved to be of advantage, as many European universities are restructuring their study programs toward a two-phase curriculum with bachelor and master degrees.

The third curricula we used, the recommendation for BI, is issued by the German Society for Informatics and the Association of University Professors of Management, Germany. It is aimed at providing common directions for education in BI at universities. In contrast to the MSIS curriculum, which provides a detailed recommendation for a curriculum, the BI recommendation is intended as a guideline and is focused on key qualifications and core subjects to be taught. The BI recommendation is mainly orientated on a study program of nine semesters leading to a degree of "Diplom-Wirtschaftsinformatik" (diploma/master level in business informatics).

In order to cluster subjects and to provide a list of taught subjects, we customized the framework in an iterative process involving expert opinion from 10 academics from different countries. The structure follows the proposed curriculum building blocks in the MSIS curriculum. However, in order to accommodate particular subjects taught in some study programs, we added subject blocks of mathematics and logic, structural science, legislation, and economics, and business engineering, and included often taught business subjects, for example logistics, procurement, and supply chain management. The list of career electives and domain-specific subjects presented here illustrates just some of the possible topics. The framework is presented in Table 1.

Architectural Focus of BI

In contrast to IS, BI appears to have a stronger focus on mathematics, logic, and structural science.^[7] One reason

for this could be the focus on the *systematic* construction and the application of methodological principles, which are often stated as typical for BI study programs. Indeed, mathematical principles are perceived as essential in order to systematically construct, formalize, and analyze models and architectures of IS.^[16]

In this regard business informaticians are often described as IS architects (in the sense of engineers) who are actively and systematically analyzing and designing business IS. Central to this is the subject "Information System Architecture." IS Architecture describes IS through various models and refer to both a dynamic view in the form of processes and the specification of the overall structure, logical components, and the logical interrelationships of a system.^[17] The conceptual description of both views builds the methodological framework for understanding the alignment of software applications and information technologies, business processes, and the corporate strategy.^[18] One example of an important architectural framework for BI is ARIS—architecture of integrated information systems.^[19]

STUDY PROGRAM IN BI

In keeping with the points identified above, we outline an example of a BI study program, introduced at Dublin City University—the European M.Sc. in Business Informatics. As an example, we provide an overview of the program in order to give guidelines for similar programs in BI.

The central focus of the proposed curriculum for BI is to qualify individuals to lead IS-related transformations of business. This enables them to apply technological solutions and develop IS architectures to solve business problems of organizations. With this goal in mind the curriculum focuses on an engineering perspective and the integration of cultural studies. The program is intended for students who have achieved a primary degree in computing, computer science, software engineering, or a comparable discipline. The program is designed to be completed in one calendar year of full-time study and consists of two taught semesters followed by a third term consisting of a project of practical nature.

The curriculum has an emphasis on engineering principles, and includes a module on structural science, which encompasses management science, data engineering, and data mining. It also has a strong modeling component, and includes modules on IS architecture and business process management. The integrative perspective is provided by the supply chain management module. The program also covers the more traditional IS disciplines as in the strategic management of IT module. An overview of the general program structure is provided in Table 2.

In addition to the emphasis on engineering principles and core subjects of BI, the study program also supports the building of capabilities for managing transformations

Table 1 Study framework.

Informatics and fundamentals in engineering	Business and economics	IS	Integration and enterprise engineering	Informatics in action (representative)
<i>Information and Communication Technology</i> (hardware, software, networks, and communication technology) Programming and algorithms, data, and object structures <i>Mathematics and Logic</i> (analysis, linear algebra, numeric, logic) <i>Structural Science</i> (decision theory and methods for strategic decision making (e.g., risk analysis), statistics and quantitative models and methods, operations research, computational modeling and simulation)	Accounting and financing Marketing, production, procurement, logistics Organization, human resources, and corporate management Legislation and economics	<i>Fundamentals of Information Systems</i> (types of IS, IS industry, IS relevant legal frameworks, management, and IS) <i>Principles of Business Information Systems</i> (principles of functional and process orientation and industry solutions) <i>Data Engineering</i> (data modeling and management, knowledge engineering, and business intelligence) <i>System and Software Engineering</i> (analysis, modeling, and design) Managing data communication and networking <i>Information Management</i> (information, knowledge, and people, project, and change management, IS/IT policy, and strategy, ethics, and privacy)	Business Engineering and IS Architecture Integrating IS Functions, Processes and Data Integrating IS Technologies and Systems	Academia and research Academic and research libraries Biochemistry and molecular biology Consulting Consumer health information Customer relationship management Data warehousing Decision making e-Government information Electronic commerce Electronic publishing Environmental management Financing and banking Healthcare information Human factors Insurance management Knowledge management Library services Logistics Multimedia technologies Project management Techniques of IT consulting Technology management

Source: Helfert and Duncan.^[7]

by aiming to expand transferable skills. In essence, transferable skills are those skills that having been learned in one context can then be applied in another. Typically these skills are based on modern teaching, learning, and assessment methods, and include

- Guided independent study and activity, with specialist input when appropriate.
- Recent or current case studies.
- Essay and report writing.

- Collaborative group work and discussions.
- Presentation of findings to the group as a whole.

In the final semester, students work on a project of practical nature. The general objective of this project is to allow students to draw on the theoretical knowledge gained over the taught element and to apply it in a practical setting in an International environment. The project of a practical nature gives students the opportunity to demonstrate their ability to analyze problems in the field of BI and draw

Table 2 Curriculum overview.

Semester 1	• Research skills/Seminar topics • IS architecture • Structural science	• Business process management • Strategic management of IT • Business studies
Semester 2	• Supply chain management • Managing and working in an intercultural environment	• Sectoral applications of IS • Regulation in IS • Project management • Managing change
Summer	Dissertation/project of practical nature

conclusions according to scientific methods within a given timeframe.

SUMMARY AND CONCLUSION

This entry presented aspects of BI and illustrated a typical curriculum. We summarized some key requirements of IS graduates. In particular, graduates need a comprehensive understanding of behavioral aspects as well as software engineering, programming, and IT. Interpersonal and communication skills as well as problem solving and critical thinking capabilities are essential for any IS and BI graduate.

The example curriculum as outlined above comprises a balanced and interdisciplinary structure, which centers on engineering principles and focuses on transformation, models, and methods. The engineering penetration throughout the program is seen as one important characteristic, which differentiates this program from management-orientated IS degrees. In contrast to business administration programs, the production of information managers, often expected in practice, is not the objective of BI. As such BI can complement the management-orientated stream of the IS discipline.

In conclusion, the BI approach appears to us not only to be innovative with regard to its interdisciplinary character, but also the engineering perspective and the integration of cultural studies and practical experience in an international setting equip graduates with essential transformation capabilities. Indeed, the focus on engineering principles in BI could play an important role in future education programs.

Business Information and Its Users

Eileen G. Abels

College of Information Science and Technology, Drexel University, Philadelphia, Pennsylvania, U.S.A.

Abstract

The complexity of business requires a wide array of multidisciplinary information sources to resolve business information needs. Users of business information are as varied as the discipline of business, ranging from business professionals to the lay person interested in investing to the business school student. Aspects of business touch the lives of everyone. For this reason, librarians in public, academic, and special libraries provide business information to their patrons. In order to make the most of business information, business information literacy is essential for librarians and nonbusiness professionals who seek and use business information. Business information literacy includes an understanding of business terminology as well as trends in business that have an impact on access to business information such as information overload, transparency, and the blurring of various components of business.

INTRODUCTION

Business, commercial activity involving the exchange of money for goods or services, is large and complex affecting all aspects of society. In 2006, there were approximately 26.8 million businesses in the United States. The complexity of business can be attributed to several factors: business events change at a rapid pace; business is closely tied to the economy; and business problems require multidisciplinary solutions.^[1] Business consists of industries that are comprised of companies that provide products and services. Business has changed over time; we have seen a decrease in manufacturing and an increase in service industries as well as an emphasis on communication, information, and computing technologies. Technological and social changes have had an impact on business. Davis and Meyer^[2] note that three factors, speed, connectivity, and intangibles, have resulted in a “new world” they refer to as “blur.” In this blur, there is no longer a clear distinction between a product and a service as products now incorporate services into their offerings. The integration of new technologies will continue to blur the distinctions of once separate components of business. A trend that has had an increasingly important impact on business is the demand from the public for transparency. To encourage transparency, new laws and regulations require that more and more information be made available to everyone who interacts with business. In addition, new technologies, such as blogs, are providing more internal information to those outside of an organization.

Management is another broad area closely related to business. Managerial activities include, among other

topics, the following: strategic planning, leadership, human resources, marketing, facilities management, financial management, and decision making. A variety of different types of sources provide management information, including books, videos, magazine, and journal articles.

Business information users run the widest gamut from those actively engaged in the business world to the layperson, from the entrepreneur to the student or professor in a business school. Each of these user groups has different characteristics, information needs, and information seeking behaviors. Librarians serving these various user groups in public, academic, and special libraries are called upon to provide them with business information. This entry focuses on business professionals whose various business activities relate directly to specific types of business information; business activities have influenced the forms of packaging of information to facilitate use. Business professionals include, among others, top executives, administrators, and managers. Many of the information needs and the sources used to resolve the business information needs of business professionals also apply at some level to all users of business information.

This entry will first discuss business information users and their needs. Understanding information behaviors is essential for librarians to provide appropriate library and information services. A discussion of different types of information used to resolve business information needs will be presented. A theme that will appear throughout this entry is the notion of the transparency of business activities. As will be noted, transparency is not new; however, recent events have resulted in efforts to increase transparency in business activities. Transparency has resulted in enhanced access to business information.

BUSINESS INFORMATION USERS AND THEIR NEEDS

The *Occupational Outlook Handbook* 2007–2008 (<http://www.bls.gov/OCO/>) lists a variety of managers including industrial production managers to medical and health services managers, education administrators, advertising, marketing, promotions, public relations, and sales managers. According to the *Handbook*, in 2006, administrative services managers held about 247,000 jobs; advertising, marketing, promotions, public relations, and sales managers held approximately 583,000 jobs; and financial managers held about 506,000 jobs. In addition there are related occupations that would also fall within the overall title of business professional, including, accountants and auditors, budget analysts, management analysts, and financial analysts. Every industry has its managers and for this reason, the education and training of managers varies. Business degrees at the undergraduate level or the Master of Business Administration (MBA) are common among business professionals. According to the National Center for Education Statistics (http://nces.ed.gov/programs/digest/d07/tables/dt07_290.asp), the number of degrees conferred in business in 2005–2006 was 318,042 at the bachelor level; 146,406 at the master level; and 1,711 at the doctoral level. The number of males and females were approximately equal at the bachelor's level; more males obtained the master's and doctoral degrees.

Common to business professionals is their tendency to focus on resolving the problem at hand as quickly as possible. Of major concern to the business end user is the ease of finding information, which of course means that business users will use the sources and channels most convenient to them, whether or not the sources are the most authoritative or current. However, accurate and timely information is essential for many business decisions and activities. In some cases, cost is not an issue; if critical information is needed, many business professionals will pay a premium to obtain the information in a timely fashion.

The information sources used by business professionals include informal and formal sources as well as verbal and written ones. Business professionals usually have access to “soft external information” that is available to them through personal contacts.^[3] A preference for interpersonal communication among business professionals has been well documented (pp. 194–203),^[4] (pp. 227–263).^[5,3] Business professionals often rely on a range of people for their information: customers, consultants, colleagues, experts, and product manufacturers. It is not uncommon for business professionals to call, send e-mail, or arrange an in-person meeting when seeking information. It is not surprising then that business professionals neither use the library as a primary channel for information nor are fee-based databases among the most consulted resources.

Much information about an organization is internal to the organization and is not found through computers, in books, or in online databases. Internal information may be available through internal systems or through the knowledge of employees and others affiliated with the organization. External business information sources form only a relatively small portion of sources used by business professionals.

Businesses carry out numerous activities that require information gathering. The extent to which information seeking activities are incorporated into the workplace will depend upon the resources available. Most businesses will engage in gathering competitive intelligence to some extent. Competitive intelligence involves the systematic process of gathering, organizing, analyzing, and managing data, information, and knowledge related to the environment in which a company operates. The overall objective is to convert the data, information, and knowledge into intelligence that will help a company gain a competitive advantage.

Businesses of all sizes need to understand their customers, both active and potential. The customer base is often referred to as the market. It is through research about the market that businesses of all types strive to understand the preferences and habits of actual and potential customers as well as factors that influence buying decisions.

Other common business activities include identifying companies for mergers or acquisition, planning to offer a new product or service, or expanding to a new segment of the market. More specific business tasks related to the organization itself also require information. For example, determining pay scales, selecting a new site location, completing background checks on potential clients or suppliers, compiling lists for mailings, performing a trademark search, negotiating a contract, identifying suppliers, or filling high-level positions.

One common approach to gathering important information for decision making is environmental scanning. Environmental scanning involves the assessment of the internal strengths and weaknesses of an organization in relation to the external opportunities and threats it faces. Through a variety of sources, interpersonal, print, electronic, and broadcast, business professionals uncover information about competitors, customers, economic conditions, trends, research, products, and legal issues.

Small business owners and entrepreneurs are similar to business professionals in their preference for informal oral sources of information. Young and Welsch concluded that this was due to the preference of the small business owner for customized and personalized sources of information (pp. 42–49).^[6] Franklin and Goodwin also found that small business owners relied on informal information sources that were convenient to use (p. 10).^[7]

Small businesses are a key component of business in the United States. Small businesses are defined as businesses with fewer than 500 employees. The U.S. Small

Business Administration (SBA) was founded in 1953 to assist small businesses through the provision of loans and counseling. Small businesses represent over 99% of all businesses and employ 45% of the private workforce. Of the total number of businesses, over 19 million are sole proprietorships. Like business professionals in large organizations, small business owners need information about competitors. The need for competitor information by small business owners is generally associated with the initial stages of starting a business to help determine location, pricing, and products and services to offer. Once established, small business owners focus on management information including operations, finance, and marketing unless business declines or an expansion is under consideration (pp. 42–49);^[6] (pp. 43–44).^[8]

Product information is essential to entrepreneurs since they need to know what other similar products are on the market and what is new or different about their product. Market data are also key for the entrepreneur to determine how big the market is for the product and where a potential customer would expect to purchase the product. Legal information will also be needed to resolve questions about copyright, intellectual property, trademarks, and patents.

Various information technologies have facilitated access to business information. New forms of information technology are being used to communicate with customers and employees. In person communication and the telephone have been supplemented by e-mail, instant messaging, and Weblogs. The cell phone has become ubiquitous and in addition to its use as a phone, cell phones often serve as a telephone directory or address book, provide Internet access, and include a camera.

The amount of information available in electronic format for free on the Web has greatly increased, including some resources such as patents and financial data that were previously more difficult to obtain and expensive. Information is being formatted to be accessible from mobile communication devices. Business professionals often rely on business portals which serve as a one-stop shop for business information. To facilitate access to information, Really Simple Syndication (RSS) may be used to feed information from news Web sites, Weblogs, and podcasts to end users of information on a regular basis without requiring the information seeker to initiate the activity. New search features are making it easier to access business information. For example, dynamic query suggestion tools may provide company names and ticker symbol suggestions that eliminate the need to look up this type of information before conducting a search. Visualization tools facilitate data analysis and decision making. Managers face information overload due to the nature of their work. “By virtue of their position, managers receive more information from more sources through more channels than almost anyone else in an organization” (p. 227).^[5]

Overall, the primary interest of most business information professionals in organizations of all sizes, as well as

those who are self-employed, lies in resolving information needs to assist in making decisions or resolving problems. These business professionals are not concerned with the process of information seeking but rather with the results. In fact, managers do not differentiate a discrete information seeking process but rather consider information seeking to be an integrated part of the decision making process (pp. 23–35).^[9] As with all information seekers, ease of access influences information seeking behaviors. Librarians working with business professionals will want to be proactive in providing information services and consider packaging information in ways that best meet the needs of business information users.

BUSINESS INFORMATION

In general, the types of information used to resolve many of the information needs described above include industry information, economic data, company information, financial data, contact information, demographic data, and legal information. Business information may be packaged in a variety of ways to meet the needs of business information users. Some business information sources have emerged from business activities themselves and are thus business specific; some sources of information are specialized or technical in nature and yet provide essential business information; some general reference tools have been adapted for use by business users; and some general information sources contain business information. Selected types of business information along with the types of sources that contain them will be described with some historical context when appropriate. Several books included in the section “For Further Information” will provide the reader with more comprehensive coverage of business information sources.

Business-Specific Sources

There is a wide range of industry information and due to the wide use of this type of information industry profiles have emerged. These industry profiles or surveys, available in print and electronic formats, provide prepackaged information about an industry including a description of the current environment; historical context of the industry; the industry structure; industry trends; key industry ratios and statistics; key players in the industry; an overview of products and services; related industry classification codes; and industry terminology.

Economic data and industry statistics are an important subset of industry information. The Economic Census dates back to the 1810 Decennial Census when questions on manufacturing were included with questions about the population. The 1905 Manufacturing Census was the first time an economic census was issued separately from the population census. In 1930, retail and wholesale trade

were added. The Economic Census was initiated in 1954 and is now issued every 5 years. In 2007, the Economic Census forms were sent to more than 4 million businesses. In keeping with the notion that different groups of users have different behaviors, the Economic Census has over 600 data-gathering forms for different industries. The Economic Census is mandated by law under Title 13 of the United States Code (sections 131, 191, and 224).

The Economic Census reports data using an industry classification. Recognizing the need to develop a standard industrial classification (SIC) system for all federal statistical agencies, developmental work was begun under the auspices of the U.S. Central Statistical Board, the predecessor of the Statistical Policy Office of Office of Management and Budget (OMB). The first SIC manual was issued in 1939 by the Interdepartmental Committee on Industrial Statistics which was established by the Central Statistical Board of the United States. The classification arose from the need to collect comparable data from a variety of agencies. The SIC included all industries that made up economic activity at that time. While revised periodically over the years, it was not until 1997 that the long-standing SIC was replaced with the North American Industry Classification System (NAICS) which was developed in conjunction with Mexico and Canada to provide comparable statistical data across the three countries. The NAICS recognizes a change in the focus of the economy from manufacturing to service and among other changes, created a new Information sector that includes establishments that create and disseminate information from a broad perspective. The new Information sector brings together various industries previously included in manufacturing, utilities and transportation, or the services sectors. Publishers of newspapers, books, and periodicals, and software, broadcasting and telecommunications producers and distributors, motion picture and sound recording industries, information services, libraries and archives, and data processing services are now part of this new Information sector.

Other data gathered to foster international comparability utilize the International Standard Industrial Classification (ISIC) maintained by the United Nations Statistical Office. The first version of the ISIC was issued in 1948 with periodic revisions over the years with a fourth revision approved by the United Nations Statistical Commission in March 2006.

An industry analysis would not be complete without statistics on shipments, payroll, and consumption. In order to understand the economic situation, one must utilize employment and labor statistics as well as other economic indicators. Statistical compilations aggregate useful statistics in one resource thus facilitating access. A statistical compendium compiles statistics on a given topic or generated by a particular agency or organization. The *Statistical Abstract of the United States* has been produced since 1878 by the U.S. Census Bureau and compiles statistics

gathered by a variety of government agencies, professional associations, and other entities.

Industries consist of companies and as such company information is an essential part of business information. Because of the need for company information, prepackaged company profiles have emerged as a new document type. While the content will vary somewhat depending on the producer of the company profile, most will include contact information, key officers in the company, information about the associated industry, identification of top competitors, company affiliation information (parent and subsidiary), sales figures, number of employees, year founded, and status of the company.

Company Web sites have become a very important part of company research. In many ways, the emergence of company Web sites has changed the panorama of business research. Web sites are available for entities of all types, including companies, associations, and government agencies. Company Web sites generally provide a range of information that may include contact information, company profiles, and biographical information in addition to information about products and services. The amount and type of information provided on the company Web site varies; large public companies often provide financial information along with detailed advertising campaigns, product information in the form of videos, and opportunities for customers to communicate with staff using blogs, e-mail, and chat.

Knowledge of a company's financial state is important for a variety of information needs, including merger and acquisitions as well as investment opportunities. It is in the area of financial data that the impact of transparency can be seen the most. The Securities Act of 1933 required the provision of significant information about securities that were offered for sale to the public and prohibited misrepresentations and fraud. One year later, the Securities Exchange Act of 1934 created the Securities and Exchange Commission (SEC) with oversight of all aspects of the securities industry, including brokerage firms and stock exchanges. The SEC was authorized to require periodic reporting by publicly held companies. Among the most common financial documents are annual reports and SEC filings such as the 10-K, 10-Q, and Prospectus. These public filings contain a wealth of company information including the nature of the business, history of the company, organizational structure, company auditor, balance sheets, and income statements. A complete list of SEC filings and forms can be found on the SEC's Web site. Annual reports and other SEC filings can be obtained directly from a company or obtained for a fee either online or through a courier. The SEC's EDGAR, the Electronic Data Gathering, Analysis and Retrieval system, now provides access to real time filings for those with access to the Internet. While EDGAR does not provide access to all SEC filings, it greatly facilitates access to financial data.

Research departments of major investment houses have staff members who track a variety of industries and public companies within those industries. The results are published in Investment Reports that include, for example, sales and earnings forecasts, market share projections, and research and development expenditures. The primary intent of these reports is to provide information for investment decisions; however, they are useful sources of industry and company information. Some concerns have been raised about possible bias in these reports. Over the years, newspapers have reported stories about brokerage firms that have been fined for touting stocks based on the interest of the firm rather than on the accuracy of the report or for abusive trading practices.

In 2001, the Enron scandal brought to light legal and ethical issues about the conduct of businesses and cost investors billions of dollars. It is considered by many to be the most profound crisis since the Great Depression of 1929 and resulted in more transparency in business activities.^[10] As a result of the Enron scandal, the Sarbanes-Oxley Act of 2002 was signed into law, introducing reforms for corporate responsibility, enhanced financial disclosures, and created the Public Company Accounting Oversight Board (PCAOB) to oversee the auditing role of accounting firms.

Financial filings are also available for nonprofits which are required to file an annual information return. The Form 990, Return of Organization Exempt from Income Tax or the Form 990-EZ (Short Form) is filed with the Internal Revenue Service. Regulations require nonprofits to make their three most recent filings available to the public. In addition, the Pension Protection Act of 2006 added a filing requirement for small nonprofits that were previously exempt from filing requirements. The purpose of the new filing requirement is to ensure transparency within the nonprofit sector.

Financial information for private companies, those companies whose securities are not sold to the public, is very difficult to obtain as there are no filing requirements. One alternative source of financial information or information related to finances for companies of all types is the company credit report. Credit reports have a long history, dating back to 1841 when the first credit service was created. Dun and Bradstreet (D&B) was established in 1841 by Lewis Tappan as the Mercantile Agency. Robert Dun assumed control over the agency in 1859 and renamed it R.G. Dun & Co. The Dun's Book was issued that same year with credit information for over 20,000 businesses. According to Hoover's company profile for Dun & Bradstreet (<http://access.hoovers.com>), there were over 1 million credit reports issued by 1886. R. G. Dun merged with its competitor firm John M. Bradstreet Company in 1933. The name Dun & Bradstreet was adopted in 1939. Credit reports help companies make sound credit decisions when dealing with other companies that are potential customers or suppliers.

Products and services are fundamental to businesses. Product catalogs are listings of companies' products, often with descriptions, pictures, measurements, and weights, properties, and other characteristics. Product catalogs are often available on company Web sites and are generally designed as a sales tool.

In addition to information about products and services, business professionals need information about those who purchase products or services. Off-the-shelf market research studies, prepared by market research firms, bring together market research data including sales, forecasts, market characteristics (e.g., age, income, preferences, and attitudes of consumers), new products, and competitor activities. Market research utilizes data gathered from focus groups, polls, and surveys. ACNielsen, founded in 1923 with a focus on industrial machinery, provides market research by tracking retail sales, brand loyalty, and demographics. Market research reports and data are used for general marketing activities as well as for competitive intelligence activities.

Advertising is the activity involved in bringing public attention to a product, service, or company. Advertising is available in a variety of formats: print, electronic, or broadcast (television or radio). Advertisements provide information on a company's products and services, including in many cases pricing. Advertisements also provide clues about popular products and their characteristics. For example, a review of advertisements for automobiles over time could illustrate new innovations and changing consumer tastes. Advertising may be difficult to monitor with the broad array of media through which companies advertise. There are companies, such as TNS Media Intelligence, that monitor advertising occurrences. Many company Web sites are good sources of advertising information, including current and historic advertising campaigns. In many cases, the main purpose of the company Web site is marketing so the Web site itself serves as advertising. Advertising is useful in competitive intelligence activities and is also used for price determination of new and existing products.

Specialized and Technical Nonbusiness Information

A patent is an often overlooked source of product information. A patent is a grant issued by the government giving inventors the right to exclude others from making, using, or selling the invention for 20 years. In return, the inventors fully disclose information about their invention to the public. There are three types of patents: utility patents which describe the way something works; design patents which describe the way something looks; and plant patents which are for a new variety of asexually reproduced plants. Patents are an excellent and detailed source of product information including graphics and images. They are also an important part of competitive

intelligence research and general company research. Patent research is essential for research and development so that time and money are not invested in an already existing product. A trademark is a word, name, or symbol that is used to distinguish a product or service from other products and services. Trademarks apply to logos, images, and sounds.

The role of the U.S. Patent and Trademark Office (USPTO), a federal agency founded in 1802 and currently located within the U.S. Department of Commerce, is to promote the progress of science by providing investors the exclusive rights to their inventions or discoveries for a limited period of time. (Article 1, Section 8 of the United States Constitution). In addition to reviewing patent and trademark applications, the USPTO disseminates information through freely available databases on its Web site. The Patent and Trademark Depository Library Program (PTDLP) began in 1871 when a federal statute (35 USC 12) first provided for the distribution of printed patents to libraries for use by the public. Now, all of the patent and trademark information is distributed to these libraries in a variety of formats including print, microform, and DVD. New rules have been and continue to be proposed by the USPTO to improve the efficiency of the patent process; a description of these rules and their status are available on the USPTO Web site. Patents were once available in print only through the PTDLP. Then commercial database services provided access to patents for a fee. Now patents are freely available on the USPTO Web site and through other Web sites. Patent offices in several other countries also offer access to patents through databases available on their Web sites, for example, the Canadian Intellectual Property Office (<http://www.cipo.ic.gc.ca/>), the European Patent Office (<http://www.epo.org/>), and the German Patent and Trademark Office (<http://www.dpma.de/>).

Laws and regulations are the rules and principles governing and regulating various activities. Laws and regulations impact the way companies do business so tracking them is critical to running a business. Legislative information may be of interest to businesses that want to monitor the status of Congressional bills that affect their activities. Proposed rules are of interest to many business information users; it is during the comment period that input can be given before a rule becomes final. Individual agencies that administer the law or regulation in question may also provide access to that information. More generally, the *Congressional Record*, first published in 1873, contains legislative regulations and is the official record of the United States Congress. In addition, The *Federal Register*, a daily publication that was first published on March 14, 1936, contains rules, proposed rules, and notices of Federal agencies and organizations, as well as executive orders and other presidential documents. The *Federal Register* is another example of an effort to provide transparency to the public. The role of the Federal Register has grown over the years and additional information has been added for

dissemination to the public. The *Code of Federal Regulations (CFR)* codifies the rules published in the *Federal Register*. Both the *Federal Register* and the CFR are available on the Internet for free.

Commonly Used General Reference Tools

Business professionals consult a variety of reference tools. There are encyclopedias, dictionaries, almanacs, etc. that focus specifically on business topics. Directories have emerged as a very important reference tool and business directories have evolved over the years to meet business information needs. While directories are listings of people or organizations that include contact information, the amount and type of information included in business directories varies greatly. Some directories may include only public companies or companies with earnings over a certain amount while other directories will include all types of companies, public, private, and nonprofit. Some directories provide contact information only and others will include additional company information such as financial information, detailed product information, historical information, and biographical information. Because people move from one organization to another and organizations may be acquired or go out of business, currency and accuracy is often an issue with directories. Many electronic directories offer field searching that is useful for identifying companies that meet certain characteristics.

General Information Sources

Organizations of all types provide news and press releases to announce business activities in a timely manner. Companies will provide up-to-date information about earnings; merger and acquisition activity; personnel changes; new product announcements; public offerings; and litigation. News releases from government agencies provide current information about economic indicators as well as results from economic and demographic surveys.

Newspapers are a major source of business information. Newspapers come in a variety of formats, covering different geographic areas, with broad or narrow focus. Business professionals are familiar with newspapers and look toward newspapers to answer many business questions. Daily newspapers, such as the *Washington Post*, *New York Times*, and the *Los Angeles Times* are staples for business collections. They provide news, company information, industry information, stock quotes and other financial data, biographical information, and statistics. Other newspapers with comprehensive coverage for a more targeted audience include those focused on a specific topic, such as finance, including the *Wall Street Journal*, the *Financial Times*, and the *Investor's Business Daily*. Other news publications focus on a particular industry, such as the *Cheese Market News* or *Autobeat*

Daily. In addition to national or international news coverage, regional newspapers are an often overlooked but important resource for business information. For information on private companies or people, regional newspapers can provide useful information that will not be found elsewhere.

Closely related to newspapers are business broadcasters on television or radio networks that focus on business news and business topics rather than on general news. These broadcasts are often associated with business portals that provide additional business information through blogs and videos. Business broadcasters provide one-stop shopping for business information and are therefore popular among business professionals.

Various types of magazines and journals are used by business professionals. Business magazines focus on business issues and include such titles as *Forbes*, *Fortune*, and *Business Week*. In addition to the news provided, these magazines also issue rankings such as the Forbes 500, the Fortune 500, or the Business Week's Global 1000. Trade journals are geared to a specific industry such as *Ward's AutoWorld*, *Food Processing Magazine*, or *Variety*. Popular magazines, such as *Time* and *Newsweek*, also provide useful business information as part of their more general coverage; discussions on issues and events in these popular magazines impact business. Some journals are peer-reviewed, also called refereed journals, and publish articles that have been assessed by scholars in the field. While these may be used less frequently among business professionals, they provide useful information. Probably the most popular among the academic journals is the *Harvard Business Review*. Other examples include the *American Economic Review*, a peer-reviewed journal generated by an association, and the *Monthly Labor Review*, a peer-reviewed government publication. These different types of magazines and journals are useful for different types of business information needs. Business magazines are important sources of information, providing news, company information, industry information, statistics, and biographical information. Both business and popular magazines may be read as part of environmental scanning programs to keep up on important trends and events. Business-related peer-reviewed journals are probably most useful for learning about management issues and new research findings.

Newsletters are periodic publications, usually relatively short and narrowly focused. Newsletters are typically underutilized in business research yet they may provide detailed and sophisticated coverage of industry news or subjects of interest to companies (e.g., employee benefits) or individuals (e.g., investment).

In general, monographs are not used heavily by business professionals for decision making and daily business operations. However, business books are an important part of management literature. Throughout the years, key figures have emerged in the area of management, a few of

which will be noted here. An early notable publication related to management is Frederick Winslow Taylor's work culminating in the publication of *The Principles of Scientific Management*.^[11] Taylor's work focused on the scientific approach of management based on work flow and procedures. Peter Drucker was a prolific author of more than 30 books on management issues and is known as the father of modern management. Among other important contributions to management, Drucker introduced the concepts of decentralized decision making and managing for the future in his book entitled *The Concept of the Corporation* which shaped management practice. He also introduced the concept of the knowledge worker and management by objectives.^[12] Michael Porter, one of the leading authorities on competitive strategy, is considered to be the father of the field of modern strategy.^[13] He is often included in lists of the world's most influential thinkers on management and competitiveness.

CONCLUSION

The world of business is broad and varied as is the information available to meet the needs of business information users. Business information is needed in almost every aspect of daily life so there is a wide range of business information users. This entry has focused on business professionals as business users; understanding the information behaviors of business professionals is necessary for librarians to provide suitable business information services. Many business activities are complex, information-intensive, and time-sensitive involving a range of types of information packaged in a variety of ways. Interpersonal communication is common among business professionals who often rely on colleagues, customers, and suppliers for information. Government information, statistics, and indicators are key to business professionals in their work. Increasingly more business information is available to the public due to government demands for more transparency in business operations. New information technologies have begun to blur the distinctions between products and services and have increased information overload. Katzer and Fletcher (p. 251)^[5] summarize the manager's information dilemma and challenge to librarians serving this user group:

... too much information, but not enough of the right information in the right format through the right channel at the right time.

Business Literature: History [ELIS Classic]

Edwin T. Coman, Jr.

University of California, Riverside, California, U.S.A.

Abstract

One of the objectives of the information disciplines is to study the universe of recorded information—that is, to study the documentary products of domains of human activity—and to come to understand such bodies of literature as social and historical phenomena in and of themselves. Coman reviews the development of business from ancient times to the twentieth century, with particular attention to the history of the literatures of business and foreign trade.

—*ELIS Classic*, from 1970

INTRODUCTION

When the first caveman became a skilled manufacturer of arrowheads and traded them for a haunch of eohippus, the seeds of business were planted.

As the population increased, agriculture developed, civilization advanced, and villages arose that later became cities. There are no written records of very early business activities but archeologists have uncovered pottery and other artifacts that indicate trading contacts between the various settlements.

HISTORY

The Mediterranean and Asia Minor were not only the cradle of Western civilization, they were also the site at which the foundations of business were laid. The first business records were the cuneiform clay tablets found at the sites of cities in ancient Babylonia and Assyria. These date from about 2500 to 600 B.C. The tablets record contracts of sale, land titles, wills, trading ventures, lawsuits, and receipts and accounts.

The commercial activities of Babylon were codified in the *Code of Hammurabi* (ca. 2200 B.C.). This code of laws covers the relations between landlord and tenant, wages, the handling of herds and flocks, commercial contracts, wills, trading voyages, banking, and the treatment of slaves. Because it is so extensive, it supplies a large amount of information on the very active commercial life of this period.

The other seat of commercial activity was Egypt. Knowledge of manufacturing and commerce comes down to us from tomb and temple inscriptions, papyri, funerary models, and the writings of Greek authors. Most of these sources date from about 4000 B.C. to about A.D. 100. A Middle Kingdom papyrus describes the making of beer, and inscriptions on a Middle Kingdom tomb depict the making of perfume. Spinning and weaving are pictured

on the walls of Twelfth-Dynasty tombs at Beni Hansan and El Bersheh.

The Greek historian Herodotus traveled extensively in Egypt during the fifth century B.C. and mentions a number of manufacturing and commercial activities in his *History*. In the first century B.C. two other Greeks—the historian Diodorus in his *Historical Library* and Strabo in his *Geography*—make similar references to the commerce and industries of Egypt.

The Greeks and their predecessors, the Mycenaeans, early turned to the sea for their livelihood. The entire Greek peninsula is intersected by bays and inlets. The mountainous character of the country made communication by land difficult and reduced the available amount of arable land. In addition, numerous islands provided harbors of refuge for small vessels and natural sites for the establishment of trading posts. Therefore, it was most natural for the Greeks to become seafarers and traders.

The Greeks were quick to locate the routes of the caravans that brought silk from China; spices from India; and gold, ivory, and slaves from Africa. Early in their history, they established trading colonies at the Dardanelles and in what are now Syria, Lebanon, and Palestine.

Clay tablets discovered near Pylos, Greece, give some indication of the trade of the Mycenaeans. Although these tablets are largely tax receipts and records of military strength, they do indicate that the Mycenaeans were doing a lively trade around the eastern Mediterranean from 1500 to 1400 B.C. This trade consisted of exchanging olives, olive oil, figs, wine, perfumes, and pottery for grain and other foodstuffs, raw materials, and a few luxury items.

When the Dorians, the progenitors of the modern Greeks, took over about 1400 B.C., much of the manufacture and trade of fine pottery lapsed because the Dorians were a vigorous but ruder people, less civilized and less interested in artistic goods.

While the Greek economy was being rebuilt, the Phoenicians began to emerge as a commercial force. They probably were the branch of the Canaanites mentioned

repeatedly in the *Old Testament*; a seafaring people, they were centered around Tyre, Sidon, and Byblos in what is now Syria and Lebanon. Later, the Carthaginian branch extended its control to Sicily, Spain, and Cyprus—in fact, to the entire western Mediterranean. The seat of its power was Carthage, near the present city of Tunis, in Algeria. Despite various wars and invasions, the commercial and business operations of the Phoenicians flourished from about 1400 B.C. up to 146 B.C., when the Romans razed Carthage completely during the Third Punic War.

The first accounts of the activities of the Phoenicians occur in the Egyptian papyrus *Anastosi I* and the Amarana tablets from 1500 to 1400 B.C. The *Old Testament* describes the trade between Hiram I, King of Tyre, and King Solomon (1 Kings 9: 11; Ezek. 27), and Josephus mentions this same trade in his *Antiquities of the Jews* (xiv, 10, 6, and elsewhere). Herodotus makes numerous references to the seafaring and trading abilities of the Phoenicians in his *History*. Homer, in the *Iliad* (xxii, 744), speaks of the Phoenicians trading in Greek waters, and Xenophon, in his *Oeconomicus*, describes the skill of the Phoenicians as sailors and the high quality of their ships. Plato, in his *Republic* (lv, 435E), refers to the avariciousness of the Phoenicians and the hard bargains they drove.

The inhabitants of the towns on the Phoenician coast were occupied not only with trade but also with manufacturing. They had a monopoly on the production of a purple dye obtained from the gastropod *Murex*, and the manufacture of textiles and dyeing were important industries (Homer, *Iliad*, vi, 289). Metalwork in silver, gold, and electrum was also important (Homer, *Odyssey*, lv, 615 et seq.; xv, 458 et seq.). In addition, the Phoenicians were noted for their glass, and they mined iron and copper on the island of Cyprus.

During the Carthaginian period, which was the height of this civilization, the Phoenicians developed silver and copper mines in Spain and traded with the Britons for tin. The Greek writer Polemo records a special treaty regarding woven fabrics produced in Carthage that were a recognized luxury of the ancient world. In Sicily, Italy, and Greece, the Carthaginians sold black slaves, ivory, metals, precious stones, and all the products of central Africa that came to them by caravan.

The Phoenicians were the preeminent businessmen of the period from 1000 to 146 B.C. If they did not invent the alphabet and weights and measures, they improved these necessary adjuncts to business. They were the first to develop a system of accounts. Their skill and daring as seamen enabled them to be the first to venture into the Atlantic from the Mediterranean. In so doing they developed a regular trade with England and explored portions of the coast of western Africa. For a considerable length of time the Carthaginians completely controlled the trade of the western Mediterranean.

In addition to the works already cited, there are references to the business and commercial affairs of the Phoenicians

and Carthaginians in the writings of Polybius, Diodorus, Livy, Appian, Justin, and Strabo.

As the Greek civilization revived from the shock of the Dorian invasion, a lively trade began in the eastern Mediterranean that competed strongly with the Phoenicians. Athens became the center of commercial activity. In addition to the earlier exports of wine, olives, olive oil, and figs, the Athenians began to export objects of art. In addition, the Laurium mines supplied them with silver as a medium of exchange. Xenophon in his *Oeconomicus* throws much light on the commerce and industry of Athens. In one passage he states that the Assembly at Athens was composed of fullers, shoemakers, blacksmiths, farmers, merchants, and shopkeepers. He also refers to the litigious tendencies of the Greeks. There is also much material on economic activities in Plato's *Republic* and in Aristotle's *Politics*, his *Constitution of Athens* and his *Nicomachean Ethics*. Aristophanes in his plays makes caustic references to the workmen and commercial customs of the Athenians. Strabo also refers to Greek business.

The conquest of Greece, first by the Macedonians and then by the Romans, shattered Greek trade and practically destroyed the industry of the country. Greece was stripped of its artistic treasures, shipping came under the control of the Romans who took over the trade from the Far East, and pirates from Crete practically destroyed the local shipping.

The Romans were interested in conquest, administration, and public works. As a matter of fact, they looked down on trade and industry. They left trade in the hands of the Greeks and other foreigners, and industry was largely performed by slave labor under the direction of foreign overseers. Cicero in his letters (*Familiares*; *ad Atticum*; *ad Quintum*; and *ad Brutum*) throws some light on commercial and manufacturing activities, of which he speaks very grudgingly. Livy's *History of Rome*, Strabo's *Geography*, and Pliny's *Natural History* all contain references to business and commerce.

Agriculture did interest the Romans and was regarded as an honorable occupation. After the very early period, farming was based on the operation of large estates (latifundia system) worked by slaves under the direction of overseers. In order to keep track of this business, the Romans worked out a fairly complete accounting system. A highly romantic account of Roman agriculture is found in the *Eclogues* and *Georgics* of Vergil.

The break-up of the Roman Empire destroyed the peace and communications in the Mediterranean basin. This curtailed the large trade with the Far East. The importation of spices, perfumes, silks, ivory, precious stones, and pearls from India, Persia, and China amounted to 100 million sesterces (\$4 million) annually in the time of Pliny.

As the barbarian invaders took over, commercial activities were gradually acquired by the Italians, Provençals, and Catalans. The most active in this trade were the

Venetians, the Genoese, and the Florentines. It was largely a revival of the old trade in spices and luxury goods of the Far East. The development and extent of this trade is described in detail in W. Heyd's *Histoire du Commerce du Levant au Moyen Age* (Leipzig, 1885).

There are many references to the trade of these cities in the treaties and other records in their archives. Venice and Florence became very wealthy centers of manufacturing, trade, and shipping. The Venetians profited immensely from the Crusades; they furnished supplies, funds, and transportation to the Crusaders in return for trading rights in the conquered territories as well as cash payment for their services.

As a result of these activities, the Venetians, Florentines, and Genoese accumulated large financial resources and became the bankers of Europe during the thirteenth, fourteenth, and fifteenth centuries.

The invention of printing from movable type around 1450 made it possible to make information more readily available. The first book dealing with business was that by Lucca Paccioli, *Summa de Arithmetica, Geometrica et Proportionalta* (Venice, 1494), which had a section on double-entry bookkeeping. This method of accounting was soon dubbed the Italian system and spread very rapidly. Schools were established in Venice and merchants sent their sons there to be taught this method. Soon rival schools were set up in Antwerp and Augsburg, and later in London and Paris.

In the sixteenth and seventeenth centuries, commerce and industry arose in France, England, Holland, and Germany. This was the period of the demise of the feudal system, the coming to power of the merchants, and the freeing of the artisans from the control of their feudal masters.

An early work that describes commercial developments in Antwerp and Amsterdam is Ludovico Gucciardini's *Descrizione de Paesi Basse* (Antwerp, 1567). Sir Walter Raleigh wrote *Observations Touching on Trade and Commerce with Holland* about 1616. A work by John de Witt, which probably was the English translation of a French book by M. Delacourt, was *True Interest of Holland*, which appeared in 1667. The *Richesse de la Holland* was published anonymously in Amsterdam in 1678.

The records of treaties, suits, and business alliances of the powerful Fugger family provide insight into the operations of the Hanseatic League in the Baltic. A good résumé of this area and period can be found in Richard Ehrenberg's *Capital and Finance in the Age of the Renaissance: A Study of the Fuggers and their Connections* (New York, 1928?).

The stirrings of commercial life were very active in England at this time, and much light is thrown on commerce and industry through the various petitions, suits, and requests for charters that appear in *British State Papers—Domestic* and the records of the Privy Council, of the City of London, and of the various guilds.

Under the stimulus of developing trade, British merchants strove to improve and better control their operations. They were most interested in books that would be helpful to them. The earliest of these business books was Hugh Oldcastle's *A Profitable Treatyce: called the Instrument or Boke to learn to know the good order of keepyng of the famouse reconyng called in Latyn Dare and Habere and in Englyshe, Debtor and Creditor* (London, 1543). This was followed at a considerably later date by Richard Dafforne's *The Merchants Mirror: or directions for the perfect ordering and keeping of his accounts* (London, 1635). This book went through four printings and encouraged Dafforne to publish *The Apprentice's time enter-tainer accomptantly: or a methodical means to obtain the equisite art of accomptantship* (London, 1640). There is no record as to how this book was received by the apprentices but it did go through three editions.

The honors for popularity of books on accounting goes to George Fisher's *The Instructor: or young man's best companion. Containing... merchant's accompts, and a short and easy method of shop and book keeping* (Dublin, 1736). It took 31 printings to satisfy the demand.

Books on specialized accounting soon began to appear; the earliest of these was John Brown's *The Merchant's Avizo, very necessaire for their sonnes and servants when they first send them . . . to Spaine and Portugal* (London, 1589). Another popular book was one by Richard Hayes entitled *The Ship and Supercargo Bookkeeper* (London, 1731). There were other books on accounting for trade with British America, India, and for ships, banks, and estates. B. S. Yaney, et al., in *Accounting in England and Scotland: 1543 to 1800* (London, 1963) give a very full history of accounting and its literature.

The late seventeenth century and all of the eighteenth century was a period of ferment. Not only were commercial rivalries bitter between England, France, Holland, and Spain, but new methods and new products were coming onto the market. This caused serious dislocation of earlier industries and was also reflected in national policies. In England, an acrimonious controversy went on concerning the extent of governmental control, whether free trade or protection was best for the country, and what was best for the national interest. This debate went on to a lesser extent in other countries, but in France it was suppressed under the mercantilistic policies of Colbert under which the state closely controlled commercial and industrial activities. This period is described in part by Germain Martin's *La Grande Industrie en France sous Règne de Louis xiv* (Paris, 1898). A very comprehensive account of the state of industry and technology appearing in the latter part of the eighteenth century was the *Encyclopédie ou Dictionnaire des Sciences, des Arts et des Métiers* by Denis Diderot (Paris, 1751–1772; 17 vols.). An earlier French publication, *Dictionnaire Universel de Commerce* by Jules Savary des Brulons (Paris, 1723–1730), was of more interest to merchants. Malachy Postlewayt published

his *Universal Dictionary of Trade and Commerce* in London in 1751–1755; this was largely a translation of des Brulons's *Dictionnaire*.

There was a groping toward the development of economic theory from 1650 to 1750, especially in England. Publications, particularly tracts, appeared in increasing numbers. One of the earliest of these was *A Discourse of the Common Weal of Thys Realm of England* by Richard Hales (London, 1549). In 1581 Hales published in Cambridge an anonymous tract, *A Compendious or briefe examination of certayne ordinary complaints of diuerse of our countrymen in these our days: which although they are somewhat uniust & friuolous, yet are they all by way of dialogues thoroughly debated and discussed by W.S. Gentleman*. Hales held forth on the causes of poverty and the high cost of living, which he attributed to foreign trade and the debasement of the currency. He advocated restriction of the exportation of raw materials and of the importation of trifles (nonessential goods).

Gerald de Milynes (fl. 1568–1641), the assayer at the Royal Mint, was, as might be expected, very much concerned with monetary questions. His three books, *A Treatise on the Canker of England's Commonwealth* (London, 1601), *England's View in the Unmasking of Two Paradoxes* (London, 1603), and *Consuetudo* (London; several editions, the last in 1686), all dealt with monetary problems.

Edward Misselden (fl. 1608–1654) did battle with Hales, poking holes in his reasoning and conclusions in *Free Trade or the Means to make Trade Flourish* (London, 1621) and *Circle of Commerce* (London, 1629).

Thomas Mun (fl. 1571–1641) in his writings was an unconscious influence on Adam Smith in his works on foreign trade. These were *A Discourse on Trade from England unto East-Indies* (London, 1621) and *England's Treasure: by Forraign Trade: or the Ballance of our Forraign Trade is the Rule of our Treasure* (London, 1664), published after his death.

Nehemiah Grew (1641–1712), a British physician, pointed the way to the concept of utilitarianism and brought in ideas on consumption and distribution—in other words, he was the first to recognize the place of the consumer in economics and business. Grew's contribution was a tract, *The Meanes of a Most Ample Encrease of the Wealth and Strength of England in a Few Years Humbly represented to her Majestie in the Fifth Year of Her Reign* (London, 1707).

A highly acrimonious war was waged for a short period by two publications. The *Mercator: or Commerce Retrieved, Being Consideration on the State of British Trade* (London, 1713–1714) was one. This was a free trade sheet issued twice a week for a penny. Daniel Defoe was the editor. The opposition protectionist sheet, edited by Charles King, was *British Merchant: or Commerce Preserved; In Answer to the Mercator or Commerce Retrieved* (London, 1713–1714).

The English philosopher, Thomas Hobbes (1588–1679), held the theory that all human conduct is affected by environment, especially the drive for self-preservation. His books, *Leviathan* (London, 1651) and *De Cive* (London, 1651), influenced Mill and Bentham. The Frenchman François Quesnay (1694–1774) put forth the theory that agriculture was preeminent and land was the only source of wealth. His book, *Tableau Économique* (Versailles, 1758), epitomizes the theories of the Physiocrats. Bernard de Mandeville in his *Fable of the Bees: or Private Vices Public Benefits* (London, 1714–1729) espoused for the first time the notion that the self-interest of the individual is important to the economy.

Jeremy Bentham (1748–1832) was a leading exponent of utilitarianism, i.e., that happiness is the end of human existence. He had an influence on Mill, Adam Smith, and others. Sir James Steuart (1712–1780) was one of the first to begin to draw these strands of economic thinking together and the first to use the title “political economy” in his *An Inquiry into the Principles of Political Oeconomy: being an essay on the science of Domestic Policy in Free Nations in which are particularly Population, Trade, Industry, Money, Coin, Interest, Circulation, Banks, Exchange, Public Credit and Taxes* (London, 1767; 2 vols.). David Hume (1711–1776) added the theory of utilitarianism in international trade to the growing body of works on this subject. Mill and Ricardo were both indebted to Hume.

The time was ripe in the middle of the eighteenth century to weave all these strands of economic thought into a composite whole. Adam Smith (1723–1790) was familiar with these earlier writings and many of these men were his friends. His *An Inquiry into the Wealth of Nations and Causes of the Wealth of Nations* (London, 1776) laid the cornerstone of modern economics and became the bible of the supporters of *laissez faire*.

During this period, there were a number of articles on economics, trade, and commerce appearing in the *Philosophical Transactions of the Royal Society* (1665–). A publication of interest to businessmen was *The Annual Register* (London, 1758–), which carried much information on the political situation and the state of trade and industry in foreign countries. The Society for the Encouragement of Arts, Manufactures, and Commerce began publishing its *Transactions* in 1761. Other information of interest to businessmen was published in the *Journals of the House of Commons*, the *Journals of the House of Lords*, and the reports of committees made in response to petitions of businessmen or labor groups.

The forerunner of the British Board of Trade was formed as a committee of the Privy Council by Oliver Cromwell in 1660. This was designated as the Commission of Trade and Plantations. After being abolished in 1679, it was revived by William III in 1679 and was made a permanent body in 1786. Almost from the beginning, the Board of Trade compiled and published abstracts,

memoranda, tables, and charts relating to trade and industrial conditions in the United Kingdom, its colonies, and foreign countries. It now supervises trade accounts and provides monthly and annual data on shipping and navigation; labor, cotton, and emigration statistics; and foreign and colonial customs tariffs. The Board of Trade also provides individual businessmen with accurate information, and on occasion, confidential data. The *Board of Trade Journal* (1886–) provides businessmen with current trade information.

The first businessman to write on business and economic subjects was David Ricardo (1772–1823). After making a fortune in the stock market, Ricardo retired and devoted himself to studying the economy. He studied the actual operations of business and the economy and based his observations on firsthand knowledge. He established the principle that the amount of labor expended on a product determines its worth. His major publication was *Principles of Political Economy* (London, 1817).

One of the strongest advocates of the theory of utilitarianism was John Stuart Mill (1806–1873) of the Manchester School. His views were set forth in his books, *Essays on Some Unsettled Questions of Political Economy* (London, 1843) and *Principles of Political Economy* (London, 1848; 2 vols.).

The Frenchman Jean-Baptiste Say (1767–1832) must be included here, for in his *Cours complet d'économie politique pratique* (Paris, 1828–1829), Say was the first economist to stress the importance of the entrepreneur.

The Englishman Alfred Marshall (1842–1924) was the foremost economist of his time and was largely responsible for the development of modern economics. His *Principles of Economics* (London, 1890) went through many editions, and his *Industry and Trade* (London, 1919) and *Money, Credit and Commerce* (London, 1923) are highly respected works.

As the Industrial Revolution reached full flower in the 1880s, there was a divergence between the economic theorists and the businessmen. This was partly because the businessmen were busy transforming the economy and felt that many of the older precepts were outmoded, and partly because business was developing its own literature. Businessmen were relatively unaffected by the writings of the later economists, with two notable exceptions: Karl Marx's *Das Kapital* (Hamburg, 1867) and John Maynard Keynes's *The General Theory of Employment, Interest and Money* (London, 1936). The former laid the groundwork for the formation of labor unions and emphasized the class struggle; the latter became the handbook of the inflationists.

To return for a moment to the earlier period, there are some rather interesting accounts by travelers of economic conditions and commerce in England. Among these are Daniel Defoe's *A Tour through the Whole Island of Britain, divided into circuits or Journeys* (London, 1724–1727; 3 vols.); J. Campbell's *A Political Survey of Britain,*

being a series of reflections on the Situation, Lands, Inhabitants and Commerce of this Island (London, 1774; 4 vols.). Two foreign visitors recorded their observations in books. These were Erik T. Svedenstjerne, *Resa igenom en del af England och Scotland aren 1802 och 1803* (Stockholm, 1804) and F.A. Wendeborn, *Beitrag zur Kenntniss von Grossbritannien* (Lemgo, 1780). John Smith in his *Chronicum Rusticum: or Memoirs of Wool, Woollen Manufacture and Trade* (London, 1747?) reprinted a number of rare pamphlets on this subject.

What was perhaps the first biography of a businessman appeared in 1597. This was Thomas Deloney's *The Story of John Winchcombe, commonly called Jack of Newberry* (London, 1597). This biography of a woolen manufacturer and cloth merchant ran through many printings as it was extremely popular.

Up to this point, this entry has been concerned with developments in England and on the Continent, with no references to those in the United States. During the period 1750–1870 there was little indication in the United States of the wealth of information for the businessman that was to become available during the twentieth century.

Up until the Civil War, ships' captains and newspapers were the major sources of information aside from correspondence from agents and other businessmen. When they returned from voyages to all parts of the world, the captains had firsthand information on markets and economic and political conditions. The waterfront coffee-houses of Boston, New York, Baltimore, and Charleston were much frequented by businessmen and newspapermen. News from the interior of the United States was scanty and unreliable.

During the period 1700–1860 the businessman, depending on his locality, read the following newspapers: Boston had the *Boston Gazette* (1704–1754), a new *Boston Gazette* (1755–1836), and the *Evening Transcript* (1836–1960?); in Connecticut there was the *Hartford Courant* (1764–); Pennsylvania was served by the *United States Gazette* (1789–1847), which was absorbed by the *North American* (1830–); New York City was well supplied with newspapers, which included the *New York Gazette* (1725–1840), the *New York Herald* (1835–1964), the *New York Mercury* (1752–1783), the *New York Tribune* (1841–1964), and *The New York Times* (1851–). Perhaps the first newspaper directed to the businessman was the *Journal of Commerce and Commercial Bulletin*, founded in 1827 as the *Journal of Commerce* and in 1893 consolidated with the *Commercial Bulletin* (1865–).

In 1811 an attempt was made by Hezebiah Niles to provide a national news periodical. The *Niles Weekly Register* survived until 1849. Niles, its editor, strove for accuracy and gleaned his news from the captains of ships and merchants patronizing the Baltimore Coffee-House and the Merchants' Coffee House, also in Baltimore. He also reprinted articles from other newspapers; among those from which he drew material were the

Baltimore American and the *Commercial Advertiser* of New York. Niles published the full text of major laws, regulations, and important speeches, and he interviewed travelers. While his primary aim was to provide a weekly account of news and politics, the *Register* contained much commercial information of interest to the businessman. As an example, Niles warned businessmen that upon the conclusion of the War of 1812, their prosperity would collapse in the face of renewed competition from the British.

In the 1830s, 1840s, and 1850s, the United States was embarking on the Industrial Revolution. Factories were springing up all over the country, especially in New England and the Middle Atlantic states, and railroads were reaching out to the South and Middle West and later to the Far West.

Many issues of railroad stocks and bonds were being sold, especially in the 1870s, 1880s, and 1890s. It was most difficult to obtain information on the operations and finances of these companies. John Moody in 1870 undertook to publish a compilation of data on railroads; this appeared as *Moody's Manual of Railroad Securities*. For many years this was the only volume published each year. Eventually other volumes were added. Today, *Moody's Manual on Railroads* (renamed *Moody's Manual on Transportation* to include air and steamship lines, buses, and trucking); *Moody's Manual on Industrials*; *Moody's Manual on Public Utilities*; *Moody's Manual on Banks, Insurance Companies, Real Estate and Investment Trusts*; and *Moody's Manual on Governments and Municipals* are published annually. Moody was the first person to supply businessmen with accurate current information.

Credit was another troublesome factor to the businessman. This was particularly the case with wholesalers dealing with country storekeepers in the South and Middle West. In 1841, a young man in New York named Richard D. Dun undertook to supply merchants with credit information. In a large number of the smaller cities and towns, a merchant or banker whom he could trust would give him reliable information on the credit standing of individuals in their locality. R.G. Dun and Company soon had competition from the Bradstreet Company, which was formed by John M. Bradstreet in Cincinnati, Ohio, in 1849. At first, both these firms supplied credit information on a fee basis for each individual inquiry. This was later supplemented by *Dun's Reference Book*, which became, on the merger of the two firms in 1933, *Dun & Bradstreet Reference Book*. This volume supplies information on the type of business and capital resources of the firm or individual and gives some indication as to how promptly bills are paid. Originally issued annually, it is now kept up-to-date with bimonthly supplements. Dun & Bradstreet will, upon request, issue individual credit reports. To provide general information on credit, business conditions, and failures, Dun started *Dun's Review* in 1893. This publication has continued as *Dun's Review and Modern Industry*.

An earlier publication that is most useful to businessmen is the *Commercial and Financial Chronicle* (New York, 1865–). This periodical provides very complete stock, bond, and commodity quotations along with articles on national finance, business conditions, and foreign trade.

The businessman has always tried to obtain up-to-date information on matters affecting his operations. This includes data on economic conditions, business trends, new improvements in methods and technology, discoveries of natural resources, and recently enacted laws and regulations. In short, statistics are highly important to his business.

The British government was quick to recognize this need of the businessman for accurate information with its Board of Trade publications, including the *Board of Trade Journal*. Its Department of Overseas Trade for many years published detailed studies of various foreign countries and colonies. These publications are supplemented by the *Royal Statistical Society Journal* (London, 1838–); the *Economic Journal* (London, 1891–) of the Royal Economic Society; and the London School of Economics and Political Science's *Economica* (London, 1921–). Although much of the material in these latter publications is concerned with methodology and theory, they do contain a number of articles of interest to the businessman.

Publications in France and Germany of a similar nature are *Journal des Économistes* (Paris, 1841–1940); *Revue Économique* (Paris, 1950–); and *Finanz-Archiv* (Stuttgart, Tubingen, 1884–1943, 1948–).

In contrast to the interest of the British government in providing information for businessmen, the U.S. government, up until 1880, provided little assistance or information to business. The first census, in 1790, was little more than an enumeration of the inhabitants. It was not until the census of 1880 that useful data on business, manufacture, finance, agriculture, and foreign commerce became available. The utility of this publication was reduced by the delay in its issuance; the last volumes did not appear until almost 10 years after the census was taken. There were earlier publications on shipping and foreign trade, but businessmen needed the bringing together of data in the decennial censuses. The situation was much improved when the Bureau of the Census began to publish *The Statistical Abstract of the United States* (1878–). This brings together a large number of statistics from governmental and other sources.

The situation was improved with the establishment of the Department of Commerce and Labor in 1903. However, the Department of Commerce did not really begin to be effective until it became a separate organization with a secretary of cabinet rank in 1913. Publications on foreign and domestic commerce were issued at this time and a modest quantity of other information was supplied to businessmen.

The Department of Commerce truly became a help to business when it was reorganized by Herbert Hoover, who

was secretary of commerce from 1920 to 1927. A large number of reports, special studies, and periodicals began to be issued from that time on. Most notable of these is the *Survey of Current Business* (Washington, 1921–). This periodical with its *Weekly Supplement* supplies statistics from a wide variety of sources on every aspect of the economy, with pertinent comment.

With the establishment of the Federal Reserve System in 1915, much greater stability was given to the American banking structure. In that year the *Federal Reserve Bulletin* began to be issued and at a later date, the *Chartbook on Financial and Business Statistics* was issued on an annual basis. Another useful source for statistics is *Business Statistics*, published since the late 1940s by the U.S. Bureau of Foreign and Domestic Commerce. The Departments of Commerce and Labor and their various bureaus issue catalogs and checklists of their publications. The bulk of these are listed in the *United States Government Publications Monthly Catalog* of the U.S. Superintendent of Documents (Washington, D.C., 1895–).

Similar compilations of statistics are published in other countries, notably *Economic Trends* and the *Monthly Digest of Statistics* (Great Britain); the *Canadian Statistical Review*; *Economic Statistics* and the *Oriental Economist* (Japan); the *Monthly Abstract of Statistics* (India); and *Boletim Estatístico* (Rio de Janeiro, Brazil).

The advent of international organizations after World Wars I and II has resulted in the compilation of data on a worldwide basis. The League of Nations published annually the *Statistical Yearbook of the League of Nations* (Geneva, 1927–1945) and the *World Economic Survey* (Geneva, 1927–1945). These publications have been continued by the United Nations in its *Statistical Yearbook* (New York, 1948–), the *United Nations Monthly Bulletin of Statistics*, the *United Nations Economic Bulletin for Asia and the Far East*, and the *United Nations Economic Bulletin for Europe*; the two last-named periodicals appear quarterly.

Nongovernmental compilations of statistics and data on business are *Statesman's Year-book* (London, 1863–); *Whitaker's Almanac* (London, 1868–); *World Almanac and Book of Facts* (New York, 1885–); Standard and Poor's Corporation's *Trade and Securities Statistics* (New York, 1928–); and the National Industrial Conference Board's *The Economic Almanac* (New York, 1939–).

All the general periodicals directed toward the business reader, as well as trade publications, carry statistical and other data. The larger newspapers have much valuable information, especially the *London Times*, *The New York Times* and the *Wall Street Journal*. These three have the additional advantage of being thoroughly indexed.

The material contained in the publications listed dealing with statistics is of prime importance to businessmen and therefore has been discussed at some length.

Trade associations were formed in Great Britain early in the nineteenth century; these included associations of

the cotton spinners and the woolen manufacturers. Trade associations did not appear in the United States until 1870. In 1896, the National Association of Manufacturers was established by men in manufacturing and business. The objectives of this association are 1) promotion of the industrial interests of the United States; 2) fostering of the domestic and foreign commerce of the United States; 3) the betterment of relations between employers and employees; 4) protection of the individual rights of employers and employees; 5) the dissemination of information among the public with respect to the principles of individual liberty and the ownership of property; and 6) the support of legislation to these ends.

The National Association of Manufacturers and the individual trade associations were originally concerned with protecting their interests through lobbying for legislation favorable to them, particularly protective tariffs, and defeating legislation regarded as unfavorable to business. The number of trade associations has increased enormously and there are now not only trade associations for every industry but also for subdivisions of that industry and regional associations. As an example, there are 10 associations for the leather industry, ranging from the Tanners Council of America and the National Hide Association to the Last Manufacturers Association and the National Association of Slipper and Playshoe Manufacturers. Many of these associations put out publications containing news of the trade, statistics, remarks on the general state of the economy, and references to books and articles of interest to their members. The larger associations maintain research staffs that can help members with problems. Among these are the American Iron and Steel Institute, the Copper and Brass Research Organization, the American Petroleum Institute, and the National Association of Wool Manufacturers.

The chamber of commerce has flourished in the United States as nowhere else in the world. No town is too small to have this organization beating the drums on its special economic, commercial, and cultural advantages. These developed independently until 1912 when the Chamber of Commerce of the United States of America was formed with headquarters in Washington, D.C. Its membership was made up of local chambers of commerce and some trade associations. The constitution of the Chamber of Commerce of the United States of America proclaims its purposes to be (1) to study national problems and define current questions; (2) to ascertain the views of business and to determine what business feels is the best solution of national problems; and (3) to voice and explain the views of business to government and the public. The chamber is subdivided into a number of departments that do research and publish many useful reports on special subjects and national issues. These departments are agriculture, construction and civil development, domestic distribution, finance, foreign commerce, foreign policy, insurance, manufacture, transportation and communication, economic

research, education, and labor relations. The chamber publishes *Nation's Business* (Washington, D.C., 1912–).

In addition to the official publications of trade associations, there are magazines put out by commercial publishers as organs of general interest to the businessman or for specific industries. In the main, these periodicals have a broader scope and more complete coverage than do the publications of the trade associations. A very useful feature is their annual survey numbers, which sum up the state of the industry. The McGraw-Hill Book Company publishes the largest number of these trade magazines; one of general interest is *Business Week* (New York, 1929–). Other periodicals of general interest are *Nation's Business*, already mentioned, and the *U.S. News and World Report* (Washington, D.C., 1936–).

Many large companies publish magazines for their stockholders which supply information both on the operations of the company and on the industry as a whole. The larger brokerage firms put out large numbers of financial studies of firms and industries.

Schools of Business

As businesses grew in size and scope, thoughtful businessmen recognized the need for objective, scientific study of business and its operations. This thinking led to the establishment of schools of business in colleges and universities. The first of these was the Wharton School of Business at the University of Pennsylvania, which received its first students in 1881. This was followed by schools of business at the University of California and the University of Chicago in 1898. The Amos Tuck School of Administration and Finance was established at Dartmouth College in 1900, as were schools at the University of Wisconsin and New York University. The Harvard Graduate School of Business Administration came into being in 1908 and was the first to offer entirely graduate instruction. The Stanford Graduate School of Business opened its doors in 1924. Now there is scarcely a large educational institution that does not have a school of business.

This marriage between business and education has proved to be a happy one. It has provided the means to do competent and scientific research on the operations and methods of business without the pressure of day-to-day business operations and has trained a body of excellent business executives. Splendid reports, studies, and books are constantly being published by the faculties of schools of business; these are too numerous to be included. The librarians connected with the schools of business have been of immense assistance to business with their compilation and publication of bibliographies and checklists on all phases of business. A few of the excellent periodical publications of schools of business are the *Harvard Business Review* (Boston, 1922–); the *Journal of Business of the University of Chicago* (Chicago, 1928–); the *London and Cambridge Economic Services Report on Current*

Economic Conditions (London, 1923 – 1951); and the *Michigan Business Review* (Ann Arbor, Mich., 1949–).

Two institutions do business research independently of the academic world. These are the National Industrial Conference Board in New York and The Brookings Institution of Washington, D.C. The former is supported by firms and businessmen and supplies a large number of special reports, largely drawn from the experience of its members, to its membership. It publishes two periodicals, *The Conference Board Record* (New York, 1944–) and *The Conference Board Management Record* (New York, 1939–). The board also prepares the data for the *Economic Almanac* published by *Newsweek*. The Brookings Institution is engaged in long-range studies in depth dealing with the economy as a whole and also socioeconomic problems. The results of these studies appear at irregular intervals in the form of books. A foundation that is also on occasion concerned with research in business, with a slightly antibusiness bias, is the Twentieth Century Fund of New York.

Study of Scientific Management

After World War I, business increased greatly in scope and complexity and has continued to do so to the present day. From about 1915 on, there has been the tendency to break down business into its components, that is, finance, production, marketing, advertising and sales management, management, and personnel relations. This trend was given impetus by the studies in scientific management conducted in Europe and the United States by Oliver Sheldon (England), Henri Fayol (France), Frederick Winslow Taylor (United States), Henry Lawrence Gantt (United States), Frank B. and Lilian Gilbreth (United States), Mary Parker Follett (United States), and L. Urwick (England). This pioneering work has been continued in the United States by Wallace Clark, Harry Arthur Hopf, Ralph C. Davis, Leon P. Alford, Dexter S. Kimball, and Paul E. Holden.

Since the work of these men has been an important influence on business and industry throughout the world, it is only proper to list some of their books in this area. Frederick Winslow Taylor's books, *Shop Management* (New York, 1903) and *Principles of Scientific Management* (New York, 1911), started the trend to scientific management. Other important books in this field are Henry Lawrence Gantt's *Work, Wages and Profits* (New York, 1910) and his *Industrial Leadership* (New Haven, 1915); Harrington Emerson's *Twelve Principles of Efficiency* (New York, 1911); Frank B. Gilbreth's *Primer of Scientific Management* (New York, 1911) and his and Lilian M. Gilbreth's *Applied Motion Study* (New York, 1917). The work of these early pioneers is summarized in Frank Barkley Copley's *Frederick W. Taylor, Father of Scientific Management* (New York, 1923) and Leon P. Alford's *Henry Lawrence Gantt, Leader in Industry*

(New York, 1934). Oliver Sheldon in his *Philosophy of Management* (London, 1923) brought out the British aspects of scientific management, as did Henri Fayol in his *Industrial and General Administration* (Paris, 1920) for the French.

Later works in this field are the following: Paul E. Holden, Lounsbury Fish, and Hubert L. Smith, *Top Management, Organization and Control* (Stanford, California, 1948); A. Filippetti, *Industrial Management in Transition* (Homewood, Illinois, 1953); L. Urwick, ed., *The Golden Books of Management, An Historical Account of the Life and Work of Seventy Pioneers* (London, 1956); A. Rathe, ed., *Gantt on Management: Guidelines for Today's Executive* (New York, 1961). Other works in this important field are the following: W. B. Cornell, *Organization and Management in Industry and Business*, 4th ed. (New York, 1958); R. C. Davis, *Industrial Organization and Management* (New York, 1957); W. R. Spriegel and E. C. Davis, *Principles of Business Organization and Operation*, 3rd ed. (Englewood Cliffs, New Jersey, 1960). These books by no means exhaust the list of excellent books in this field and its subdivisions.

It was only natural that persons working in specific phases of business should join together in associations. Mechanical and civil engineers formed professional organizations at an early date. The first business professional group to organize were the accountants. The American Institute of Accountants was formed in 1887 and is now known as the American Institute of Certified Public Accountants. This American society was preceded by the Society of Accountants in Edinburgh (1854), similar societies in Glasgow (1855) and Aberdeen (1867), and the Institute of Accountants, formed in London in 1870. Scientific management was represented by the Taylor Society (1914), which in 1934 combined with the American Management Association (1923). The National Office Management Association (1919) has now changed its name to Administrative Management Society.

Other associations interested in improving business operations are the American Accounting Association (1916), the American Marketing Association (1915), and the National Association of Accountants (1919).

All these organizations publish periodicals and research collegiate schools of business, provide a most important body of business literature.

This treatment of business literature is already overlong; hence in the following list, references to the literature in specific fields of business are limited to those works that supply the greatest amount of information in the smallest compass.

Banking, Finance, and Investments

American Bankers Association. *Present Day Banking*; New York, 1954–1958; Vol. 6.

Bogen, J.I., et al. Eds. *Financial Handbook*, 3rd Ed.; New York, 1957.

Garcia, F.L.; Munn, G.G. *Encyclopedia of Banking and Finance*, 6th Ed.; New York, 1962.

Gerstenberg, C.W. *Financial Organization and Management*, 4th Ed.; Englewood Cliffs, NJ, 1959.

Jordon, D.F.; Dougall, H.E. *Investments*, 7th Ed.; Englewood Cliffs, NJ, 1960.

Prentice-Hall History of Money and Banking, Englewood Cliffs, NJ, 1962–1963; Vol. 18.

Real Estate and Insurance

Best's Insurance Reports (Fire and Marine) and (Casualty and Surety); New York, 1899–.

Dodge Statistical Service; New York, 1925?– (real estate).

Huebner, S.S.; Black, K. *Property Insurance*, 4th Ed.; New York, 1957.

Husband, W.H.; Anderson, F.R. *Real Estate*, 3rd Ed.; Homewood, IL, 1960.

The Insurance Almanac; New York, 1912–.

North, N.L.; Ring, A.A. *Real Estate Principles and Practices*, 5th Ed.; Englewood Cliffs, NJ, 1960.

Riegel, R.; Miller, J.S. *Insurance Principles and Practices*, 4th Ed.; Englewood Cliffs, NJ, 1959.

Spectator Insurance Yearbooks, Fire and Marine volume; Philadelphia, PA, 1928–.

Accounting

Barker, M., Ed., *Handbook of Modern Accounting Theory*; Englewood Cliffs, NJ, 1955.

Dickey, R.L. ed.; *Accountant's Cost Handbook*, 2nd Ed.; New York, 1960.

Lasser, J. K. *Handbook of Accounting Methods*, 2nd Ed.; New York, 1954.

Personnel and Industrial Relations

Aspley, J.C., Ed. *The Handbook of Employee Relations*; Chicago, IL, 1957.

Heyel, C., Ed. *The Foreman's Handbook*, 3rd Ed.; New York, 1955.

Yoder, D. et al., *Handbook of Personnel Management and Labor Relations*; New York, 1958.

Marketing, Sales Management, and Advertising

Aspley, J.C. Ed. *The Sales Manager's Handbook*, 8th Ed.; Chicago, IL, 1959.

Aspley, J.C. Ed. *The Sales Promotion Handbook*; Chicago, IL, 1954.

Barton, R. *Advertising Handbook*; Englewood Cliffs, NJ, 1950.

- Beckman, T.N. *Marketing*, 7th Ed.; New York, 1962.
- Canfield, B.R. *Sales Administration, Principles and Practices*, 4th Ed.; Englewood Cliffs, NJ, 1961.
- Hepner, H.W. *Modern Advertising, Practice and Principles*, 3rd Ed.; New York, 1956.
- Nystrom, P.H. Ed. *Marketing Handbook*; New York, 1948.
- Philips, C.F.; Duncan, D.J.; *Marketing Principles and Methods*, 3rd Ed.; Homewood, IL, 1960.

Public Relations

- Aspley, J.C.; Houten, L.L., Eds.; *The Dartnall Public Relations Handbook*, 3rd Ed.; Chicago, IL, 1961.
- Cutlip, S.M.; Center, A.H.; *Effective Public Relations*, 2nd Ed.; Englewood Cliffs, NJ, 1958.
- Lerley, P. Ed.; *Handbook of Public Relations*, 2nd Ed.; Englewood Cliffs, NJ, 1960.

FOREIGN TRADE

- Chamber of Commerce of the United States of America. *Foreign Commerce Handbook: Basic Information and Guide to Sources*, 14th Ed.; Washington, DC, 1960.
- Customs House Guide*; New York (issued annually with monthly supplements).
- Exporters' Encyclopedia*; New York (issued annually).

This is but a sampling of the books available, not to mention the many periodicals. For more detailed information on where to locate publications, see Coman.^[1]

The most pressing need of the businessman is for up-to-date information. This is most readily available in the newspapers, periodicals, and loose-leaf services. Fortunately, there are indexes that enable one to locate data in periodicals and other media. The three newspaper indexes have already been mentioned. Indexes to a broad range of publications are as follows: *Business Methods Index* (Ottawa, Canada, monthly); *Business Periodicals Index* (New York, monthly); *Applied Science and Technology Index* (New York, monthly); *Readers' Guide to Periodical Literature* (New York, monthly); *UNESCO International Bibliography of Economics* (Paris, monthly). More specialized indexes are as follows: *Index of Corporations* (Detroit, weekly); *Statistical Sources* (Detroit, monthly); *Management Index* (Ottawa, Canada, monthly); and *Accountants' Index* (New York, monthly).

The loose-leaf services that supply a stream of information daily are most popular in the United States. Commerce Clearing House, the Bureau of National Affairs, and Prentice-Hall (Englewood Cliffs, New Jersey) all have services on labor relations, taxation, and corporation law.

The tremendous amount of material being published creates a problem for the businessman as it becomes more

and more difficult for him to keep abreast of information vital to him. Various abstracting services have been devised to give the businessman a quick view of the literature in general. The most complete coverage is in *Economic Abstracts: A Semi-monthly Review of Abstracts on Economics, Finance, Trade and Industry, Management and Labour* (The Hague, 1953–). The coverage is extremely broad in that it includes abstracts of books, periodical articles, and reports of governments and international organizations published in Europe, North America, and Great Britain. The American Economic Association publishes the *Journal of Economic Abstracts* (Cambridge, Mass., 1963–), which tends to cover the more theoretical aspects of economics and business.

Specialized abstracting seems to be largely confined to personnel and industrial relations. These include *Issues & Ideas: Abstracts of the Current Literature in Management, Organization and Industrial Relations* (Chicago, 1954–); *Employment Relations Abstracts* (Detroit, 1950–); *Industrial and Labor Relations: Abstracts and Annotations of Current and Periodical Literature* (Ithaca, N.Y., 1948–1957); and *Management Abstracts* (Ann Arbor, Mich., 1955–).

One other publication, which should have been mentioned earlier, is *International Encyclopedia of the Social Sciences* (New York, 1968).

Reference has been made to the excellent bibliographies and other publications of the librarians in business libraries. This work was greatly encouraged when these librarians joined together in 1909 to form the Special Libraries Association. Various committees and chapters of this association have published many studies and very complete bibliographies on general and special subjects. The members have done much to increase the availability of business information.

Mechanization of business office operations began with the acceptance of the typewriter as a business tool in the 1890s; this was followed not too much later by the adding machine and the comptometer. Here progress rested until the advent of the computer. Now, in the larger firms, payroll and dividend checks, insurance claims, and much of the accounting for customers of banks and retail stores is done by computer. The military, the Bureau of the Census, and the Internal Revenue Service have gone heavily into the computerization of their activities. The various stock exchanges are striving to gain control of their paperwork through the use of computers.

There are still a number of problems, technical and especially economic, to be worked out before computerized retrieval of information works satisfactorily. The MEDLARS program for the retrieval of medical data and the current plans of NASA give promise of developing workable systems that will spread to other subject areas. There are two business-related computer information retrieval systems now in operation on a commercial basis. The *Standard Statistics Compustat Service*, Standard and Poor's Corporation, New York, supplies either magnetic

tapes or punched cards to subscribers. Fifty-one types of basic pertinent information, updated 10 to 12 times a year, are supplied on leading industrial and utility corporations. All this material is in machine-readable language.

The *Dun and Bradstreet Sales and Marketing Identification Service* is a roster of U.S. manufacturing and commercial establishments on magnetic tape of its IBM 1401 and 1410 systems. This computerized file of 300,000 firms provides the name, address, and up to 20 "identifiers" for each company. Information includes, in addition to the name and address, the name of the chief executive, the line of business, the Standard Industrial Classification (SIC), the number of employees, information on branches, etc., and for commercial subscribers, net worth and credit rating. Data is updated quarterly and is available on computer printouts, on 3 by 5 cards, or printed on tabulating cards.

Another useful but less sophisticated service is *Thomas Register of American Manufacturers*, *Thomas Micro-Catalog*. The complete catalogs of all the firms listed in *Thomas Register* are available on microfiche and each subscriber is given a microfiche reader.

The literature on computer operations falls into three parts: 1) the adaptation and utilization of computers in business; 2) the impact of the computer on business and personnel; and 3) the hardware and operation of the computer.

The following books are in the first category: C.C. Barnett, et al., *The Future of Computer Utility* (New York, 1967); Alexander Blanton, et al., *Computers and Small Manufacturers* (New York, 1967); J.R. Bright, *Automation and Management* (Boston, 1958); R.G. Canning, *Electronic Data Processing for Business and Industry* (New York, 1956); and R.L. Sisson and R.G. Canning, *A Manager's Guide to Computer Processing* (New York, 1967).

Books in the second group include the following: R.A. Brady, *Organization, Automation and Society* (Berkeley, California, 1961); J. McLaughlin, *Information Technology and Survival of the Firm* (Homewood, Illinois, 1966); and L. Ricco, *The Advance against Paperwork, Computers, Systems and Personnel* (Ann Arbor, Michigan, 1967).

Works in the third category, dealing with hardware and programming, are as follows: Gille Associates, Inc., *Data Processing Handbook* (Detroit, 1960; 13 vols.); Gille Associates, Inc., *Data Processing Equipment Encyclopedia: Electro-Mechanical Systems, Punched Card, Punched Tape, Related Systems* (Detroit, 1961; 2 vols.); E.M. Grabbe, et al., eds., *Handbook of Automation, Computation and Control* (New York, 1958–1960; 3 vols.); D.B. McCracken, H. Weiss, and T.H. Lee, *Programming Business Computers* (New York, 1959); J.G. Truxal, ed., *Control Engineer's Handbook* (New York, 1958); and J.R. Ziegler, *Time-Sharing Data Processing Systems* (Englewood Cliffs, New Jersey, 1967).

Application of computers to specific segments of business operations can be found in the following books:

R.H. Brown, *Office Automation: Integrated and Electronic Data Processing* (New York, 1958, plus extra sheets to update); R.H. Brown, *Office Automation Applications* (New York, 1959; 2 vols.); E.A. Johnson, *Accounting Systems in Modern Business* (New York, 1959).

The computer industry and its application are advancing so rapidly that a bibliography is obsolete almost as soon as it is published. A good bibliography, up to its date of publication, is C.P. Bourne's *Bibliography on Mechanization of Information Retrieval* (Menlo Park, California, 1958). The best and most current bibliography is the *International Bibliography of Automatic Control* (Brussels, 1962–), which appears monthly.

Periodicals are the best source of information on this ever-changing industry. Among these are *American Documentation* (Washington, D.C., 1937–); *IBM Journal of Research and Development* (New York, 1957–); *Information Processing Journal* (Cambridge, Massachusetts, 1962–); and *Progress in Automation* (New York, 1960–).

CONCLUSION

It is difficult to compress the very large body of excellent material published on business within the compass of this entry. Many worthwhile books and other publications have been omitted, as have certain topics. Among these are directories and the large mass of material published on particular industries.

Canada: Libraries and Archives

Ian E. Wilson

Librarian and Archivist of Canada 2004–2009, Ottawa, Ontario, Canada

Sean F. Berrigan

Policy, Library and Archives Canada, Ottawa, Ontario, Canada

Abstract

Canada's libraries and archives have evolved from the first library in 1605 to become modern knowledge and cultural heritage institutions in the twenty-first century. Key developments in this evolution are outlined in this entry together with a profile of 13 major Canadian archives and libraries. The roles and issues of national library and archival associations and groups are examined as well as the development of professional education in Canada. It concludes with a discussion of a number of challenges and issues facing Canada's libraries and archives.

THE CANADIAN CONTEXT: AN INTRODUCTION

Canada's extensive geography, small but diverse population, federal system of government, and relatively late appreciation of the value of libraries and archives have all shaped how Canada's libraries and archives have developed. Canada is the second largest country in the world with an area of 9,984,670 km² with lengthy coastlines on the Atlantic Ocean to the east, the Arctic Ocean to the north, and the Pacific Ocean to the west. It has a population of 36.2 million largely concentrated in a ribbon close to its southern border with the United States with whom it shares close cultural and professional links. It has a G7 economy. Its diverse multicultural population now includes 4.3% aboriginal peoples and 22% who were born elsewhere with the largest number arriving from Asia and the Middle East. Its largest metropolitan area, Toronto, has more foreign-born residents than Canadian-born ones.

Canada has two official languages, English and French, but Chinese is the mother tongue of more than one million Canadians followed by Italian, German, and Polish. Algonquian languages including Cree and Ojibway together with Inuktitut are the largest language group for Canada's indigenous peoples. Canada's federal government and the Province of New Brunswick are officially bilingual (French and English); Québec is officially francophone and the remainder anglophone, but often services are available in both languages to serve substantial minorities. Canada's northernmost territory, Nunavut, created in 1999, has four official languages, Inuktitut, Inuinnaqtun, English, and French, and a population of some 29,000 occupying one-fifth the land mass of Canada. The 2011 census in fact lists over 100 maternal languages in the country. The Conference Board of Canada reported in 2013 that Canada ranked 8th out of 13 countries on the percentage of adults scoring low on adult literacy rates and that four out of 10 adults have literacy skills assessed as

too low to be fully competent in most jobs in a modern economy.^[1]

Canada is a federation formed in 1867 and now includes 10 provinces and three northern territories. The governments are based on British parliamentary traditions. The Government of Canada comprises the governor general as representative of HM the Queen of Canada, the Supreme Court, and Parliament with bicameral legislature: an elected House of Commons and an appointed Senate. Each of the provinces has one elected level of legislature, with a lieutenant governor representing the Crown and provincial courts. The "Constitution Act, 1982" and its predecessor, the "British North America Act 1867," divide responsibilities between the central or federal government and provincial governments. Features of the 1982 legislation include a Canadian Charter of Rights and Freedoms, provisions for the Rights of the Aboriginal Peoples of Canada, as well as a section on Equalization and Regional Disparities. The latter provisions address discrepancies among provinces with varying economies and resources. Libraries and archives are not specifically mentioned in the sets of powers ascribed to either the federal or the provincial governments. Education, however, which usually includes public libraries under its broad umbrella, is a provincial responsibility. Municipalities and school boards are created by provincial statute. All levels of government are responsible for their own administrative archives. Canada is generally acknowledged to be one of the most decentralized federations in the world.

THE FIRST NATIONS

The comments that follow reflect the imported European approach for the transmittal of authoritative knowledge across generations, emphasizing written records and print materials. There are other forms of library and archives embodied in the culture of Canada's First Nations. The

observation that “When an elder dies, a whole library burns” is simply attributed as an African proverb. It describes the reality of other oral cultures as their traditional continuity in both language and memory is disrupted by modern urban culture. Oral history programs have been earnest and well intentioned over the past century, but they have largely been sporadic, reflecting short-term research interests. Much has been lost. Recently, the power of the formal oral tradition has been renewed as the Supreme Court recognized the legitimacy of aboriginal oral traditions^[2] and a Truth and Reconciliation Commission has reached out to the indigenous victims of the residential school system to ensure their memories and their experience remain part of the national memory. The testimony and extensive documentation gathered by this Commission (2007–2015)^[3] is now preserved and becoming accessible at the newly established National Research Centre for Truth and Reconciliation hosted at the University of Manitoba.^[4]

NEW FRANCE 1605–1763

Archives and libraries have a long history in Canada beginning with the first French settlements in what is now eastern Canada. French territory grew to include the Ohio and Mississippi river valleys down through Louisiana to the Gulf of Mexico. Marc Lescarbot is credited with bringing a modest collection of books from France to what is now Annapolis Royal, Nova Scotia, then *Acadie*, in 1605. The *Collège des Jésuites* in Quebec City, established in 1635 to teach theology, classical studies, and sciences, had a library that included books from an earlier *Bibliothèque de la Mission Canadienne de Jésuites*. The extensive archives gathered by the *Séminaire de Québec*, dating from 1623 to 1800, are inscribed in UNESCO’s Memory of the World Register. A law library supported the *Conseil supérieur du Québec* and was located in the Intendant’s Palace in Quebec City. The Canadian archival tradition under the French regime included proposals for the appointment of a custodian of archives in 1724 and for a special archive building in 1731. When Canada became a British colony in 1763, French administrative state papers were returned to an uncertain fate in France, while the records required to support the judiciary, the church, and resident notaries were retained.

THE HUDSON’S BAY COMPANY, 1670–1870

The “Governor and Company of Adventurers of England trading into Hudson’s Bay” was incorporated by Royal Charter in 1670. This granted the company a monopoly on trading for furs in all the watershed draining into the Bay. In time, as trading posts were extended inland seeking supplies of beaver pelts, the Company’s lands encompassed the whole of the Northwest Territories, with settlements in the Red River Valley, and posts

scattered across the prairies, up through the Peace River Country, into the mountains and down to the mouth of the Columbia River. The Royal Charter included an obligation to search for the fabled Northwest Passage but also granted the company most of the rights of the Crown, including making and enforcing laws, alienating land, and the use of armed forces. These powers continued for 200 years, until in 1870, they were surrendered back to the Crown, and the territory became part of the new Canadian Confederation.

From its earliest days, the governors of the Company, based in London, instructed its factors to maintain a careful daily record of weather, trade, exploration, and peoples. Records were sent back to London annually and were scrutinized by the governors. The resulting documents constitute an extraordinarily detailed and continuous record of the administration of a major portion of Canada over two centuries, in effect the national archives for that region. These records are essential now for the study of environmental change and have been used for legal matters involving land ownership, borders, and sovereignty as well as its unique insights into people and culture. The Hudson’s Bay Company Archives were moved from London, United Kingdom, to Winnipeg in 1974 and then donated to the Government of Manitoba in 1994. The archives have received deserved international recognition being inscribed in the UNESCO Memory of the World Register.

BRITISH NORTH AMERICA 1763–1867

Governments in the various British colonies that eventually became Canada were increasingly publishing various official documents. The first press was established in Halifax, Nova Scotia, in 1752. The first issue of the *Halifax Gazette*, Canada’s earliest newspaper, appeared the same year. In 1779, Governor Frederick Haldimand established a bilingual subscription library at Quebec City supported by membership and annual fees as a way of “combating the ignorance of the populations and of encouraging good relations between the former French populations and the new British one.” What is now the Legislative Library of New Brunswick began when the Province of New Brunswick was created and separated from Nova Scotia in 1784. In 1787, the governor of Quebec, Lord Dorchester, appointed a commission to survey the archives of Quebec. The Legislative Council of Quebec passed an ordinance in 1790 “For the Better Preservation and Due Distribution of the Ancient French Records” to gather records concerning property and to improve access to them; Quebec Legislative Council. 30 Geo III. C8. Legislative libraries for the provinces of Upper and Lower Canada were established around 1792. Subscription libraries such as the Montreal Library were started in

1796 and the Niagara-on-the-Lake Public Library in Niagara in 1800 and at Kingston in 1804.

The development of libraries and archives in the British North American colonies prior to Confederation in 1867 was uneven, driven by different economic, administrative, social, linguistic, and educational factors. The period to the creation of Canada in 1867 witnessed waves of immigrants—from the United States and from England, Scotland, and Ireland. They brought with them increased levels of literacy and interest in books, newspapers, and other publications as well as a strong desire to better themselves in areas such as agriculture. Garrison libraries created by the large contingents of British troops stationed in Canada gave access to their collections to local residents by subscription. The libraries of legislatures in Upper Canada and Lower Canada were united in 1841 but in 1849 were destroyed when the Parliament buildings in Montreal were burned. Libraries in support of emerging medical and legal professions developed. There were also increasing levels of wealth as witnessed by the development of important private book collections. The precursors of free public libraries had their roots in a variety of community libraries. The first Mechanics' Institutes were organized in St. John's, Newfoundland, in 1827, Montreal in 1828, Toronto in 1830, and Halifax in 1831. The Atwater Library of the Montreal Mechanics' Institute is the oldest lending library in Canada. Member supported Mechanics' Institutes were located in most major population centers to provide libraries of "useful knowledge" in support of adult education including fiction, science, reference, essays, and travel accounts. Some of these received government grants in recognition of their strong support from the public. There were also school-district libraries in Nova Scotia, Ontario, and New Brunswick prior to Confederation. Association or social libraries were much in evidence. Canada's first learned society, the Literary and Historical Society of Quebec, was established in 1824 in Quebec City with a mandate to collect, preserve, and publish Canadian records. It received government support to locate and transcribe records and for publishing. Its library remains as both a research and tourist attraction.

Various governments were putting important parts of the information infrastructure in place—an "Act for the Protection of Copyright" in Lower Canada was passed in 1832 and required the deposit of a printed copy of books, charts, maps, or prints to secure copyright. In 1836, Newfoundland passed "An Act to prevent the mischief arising from the printing and publishing books, newspapers and papers of a like nature by persons unknown and to regulate the printing and publishing the same." In 1841, the United Canadas approved "An Act for the protection of Copyrights in this Province," which required the deposit of two copies of published materials with one of these copies destined for the Library of the Legislative Assembly. The year 1851 saw the first "Public Libraries and Mechanics'

Institute Act" passed by the government of the United Canadas followed shortly by the first "School Libraries' Act." In 1857, Nova Scotia appointed a records commissioner, the first provincial archivist. To support the new federal government, the Library of the Legislative Assembly, some 55,000 volumes, was moved by barge to Ottawa. By the time of Canada's Confederation in 1867, there were a number of types of libraries and archives in place in support of cultural, social, educational, and professional pursuits.

CANADA'S LIBRARIES AND ARCHIVES TO THE END OF WORLD WAR II

With Canadian Confederation in 1867, responsibility for education and, by extension, public libraries rested with the provinces. This period is one of building the library infrastructure in the provinces with very different patterns of support and development and an aspiration throughout for the establishment of a national library. At the same time, the federal government saw the need for the establishment of archival programs. The creation of Canada in 1867 with a federal government and provincial governments in place resulted in a significant scaling up of the role of the government in Canadian society. The federal Department of the Secretary of State became responsible for the keeping of "all State records and papers and papers not transferred to other Departments," and a keeper of the records was appointed. The Library of Parliament continued the functions that had earlier been put in place with the United Canadas in 1841, and legislative libraries were established in the new provinces of Ontario, Quebec, Nova Scotia, and New Brunswick. The Library of Parliament, serving the needs of federal Members of Parliament and senators, was housed in the new Parliament buildings in Ottawa in a magnificent octagonal structure designed by Thomas Fuller and Chilion Jones.

The Literary and Historical Society of Quebec had lobbied the federal government to establish a cultural archive to assist authors and others. In response, the government established an archives branch in the Department of Agriculture in 1872, and Douglas Brymner who is considered to be the first Dominion Archivist was hired. Brymner undertook to build collections and established programs to hand copy important archival materials related to the history of Canada in London and Paris. A survey and report in 1897 on the state of federal records drew attention to what the governor general described as the "most lamentable disregard for the archives of the Dominion." In response, the government consolidated responsibilities for administrative and cultural archives, and in 1904 Dr. Arthur Doughty (later Sir Arthur) was appointed Dominion Archivist and keeper of the records, a post he was to occupy for 31 years. He accelerated the program to copy Canadian records in Paris and London

and had extraordinary success in acquiring the original papers of former colonial officials documenting all aspects of the Canadian experience. The first purpose-built archives building was opened in 1907, and its exhibition rooms attracted a wide range of visitors. Doughty began the national documentary art and portrait collections, systematically worked to document the war effort (1914–1918), and added maps, photographs, pamphlets, posters, portraits, documentary art, film, and even historical artifacts to create a multimedia comprehensive record of the country. Through active programs of publication, teaching, and exhibitions, the Public Archives of Canada became an active cultural presence, encouraging the universities to study and teach Canadian history. In the 1920s, faculty from universities across the country gathered in the Archives' reading room, exploring the original record often for the first time and providing leadership to the modern historical profession. Doughty remains today the only federal public servant honored by an official statue in Ottawa.^[5] Several provinces followed the federal public-private model for their archives, with Ontario establishing its provincial archives in 1903 and with legislation confirming the Public Archives of Nova Scotia in 1929.

The Province of Ontario passed the "Act to Provide for the Establishment of Free Libraries" in 1882 following an investigation of Mechanics' Institutes in the province and set the pace for other jurisdictions to follow suit, which they did in British Columbia (1891 "Free Libraries Act"), Manitoba (1899 "Free Public Libraries Act"), Saskatchewan (1906), and Alberta (1907). The 1882 legislation in Ontario gave a framework for citizens to ask their municipal councils to establish and maintain public libraries. The Toronto Public Library (TPL) opened in 1884. A year later, Ontario went further with an amendment to this legislation designating Mechanics' Institutes as public libraries. By 1901, there were estimated to be over 130 public library boards in Ontario. As towns and cities across the country put their public library organizations in place, Andrew Carnegie, a Scottish-American philanthropist, began to support the construction of public library buildings. One hundred and twenty-five Canadian public libraries were constructed with Carnegie Foundation assistance, some \$2.5 million, between 1901 and 1925. Archives slowly advanced in several provinces, with a new provincial archives building opened in Nova Scotia in 1931.

In collaboration with the American Library Association, the Carnegie Corporation of New York also supported a major study of the library situation in Canada, *Libraries in Canada: A Study of Library Conditions and Needs*, which was published in 1933. This Commission of Enquiry was headed by John Ridington, the librarian at the University of British Columbia (UBC), together with George Locke, the chief librarian of the TPL, and Mary Black, chief librarian of the Fort William Public Library. Their report was the result of a nationwide study, which

saw every province of the country being visited in 1930 and interviews conducted with ministers, premiers of provinces, presidents and librarians of universities, public librarians, educators, and newspaper editors—a wide net was cast. The idea for such an examination of the state of libraries was born in meetings held by Canadian librarians attending American Library Association conferences in 1925 and the conference of 1927 that was held in Toronto. The Commission concluded after some 18 months of study that "though you can find books, there is no real library service, and nearly 80% of the people of Canada have nothing that could, by any stretch of the imagination, be called library service of any kind."^[6] They proposed the creation of a Dominion Library, a national library for the country, and a Dominion Librarian who would have "general charge" of the federal government's libraries whose collections should be cataloged under one common scheme. Among other duties, the Dominion Library was intended to be the recipient of the books deposited under the terms of the Copyright Act. The Commission recognized the very diverse nature of the provinces and their very different approaches to library development and support. They saw "five Canadas, each with differing backgrounds, conditions and outlooks" with only the provinces of Ontario and British Columbia recognizing "the principle that the library is an integral part of a people's welfare and educational programme." They set out some essential requirements for public library policy and legislation in the provinces and urged the formation of a national library association.^[7]

While the findings of the Commission were positively received, the harsh reality of the Depression made consideration of enhanced library development very difficult. As evidence of difficult times, in 1938 an Order in Council was passed by the federal government that authorized the destruction of materials that had been received for copyright registration purposes because there was insufficient storage space. The collection had previously been offered to the Library of Parliament and the Public Archives. In 1941, the Rockefeller Foundation of New York commissioned a study of the state of Canadian libraries, which was undertaken by Charles McCombs of the New York Public Library. He, like members of the 1930 Commission of Enquiry, visited libraries and archives in all parts of the country. He made observations about the state of libraries and archives and had a number of recommendations to make for the Rockefeller Foundation to guide them in making grants to Canadian projects. These included support for the newly organized Canadian Library Council, aid for the establishment of a National Central Library, as well as support for microphotography (equipment for microfilming newspapers, manuscripts, and archival materials), and a summary guide to the manuscript collections in Canadian libraries and archives.^[8] As World War II was ending, the new Canadian Library Council, with its national voice for libraries, submitted a brief to the federal Special

Committee on Reconstruction and Re-establishment that stressed the value of libraries for adult education and recommended the establishment of a Dominion Library Program “to guide, co-ordinate and encourage provincial, local and special efforts,”^[9] as well as national library services, library standards, and library consultation services. The notion of national library services included the establishment of a national library.

LIBRARY AND ARCHIVAL DEVELOPMENT TO THE TWENTY-FIRST CENTURY

There are a number of milestones in the post–World War II era when Canada’s archives and libraries came of age in a period of rapid economic expansion and cultural maturity. Vital leadership came with the federal government’s decision to name Dr. W. Kaye Lamb as Dominion Archivist in 1948 with responsibility for preparing the way for a national library. A Canadian Bibliographic Centre was established in 1950 under his direction, which began to assume national responsibilities for the preparation of a national bibliography and for the building of a national union catalog. The Royal Commission on Arts, Letters, and Sciences reported to the federal government in 1951 on their examination of national institutions and functions, which included a general survey of the arts, letters, and sciences. This was a landmark study and led to the strengthening of a number of federal institutions including the Public Archives of Canada and the establishment of a National Library in 1953. Dr. Lamb continued as Dominion Archivist but was also named as National Librarian. Legal deposit with the new National Library also began in 1953. The Archives addressed the government’s pressing need for effective records management and opened the first federal records center in 1956. In the provinces, the pace of change increased. The Saskatchewan Archives Act (1945) provided a model for archives control over the disposition of official records. Public library development was guided by the publication of the 1957 *Report on Provincial Library Service* in Ontario by Dr. William Stewart Wallace and then less than a decade later *Ontario Libraries: A Province-Wide Survey and Plan* by Francis R. St. John. “An Act Respecting Public Libraries” was passed in Quebec in 1959, as well as the establishment by statute of the Newfoundland Archives in 1959.

The expansion of universities and a growing interest in the study of Canada led to a number of influential studies at the national level. These included *The Humanities in Canada* by Watson Kirkconnell and A.S.P. Woodhouse (1947), *Resources of Canadian University Libraries for Research in the Humanities and Social Sciences* by Edwin E. Williams (1962), *Research in the Humanities and in the Social Sciences in Canada* by Bernard Ostry (1962), and F.E.L. Priestley’s *The Humanities in Canada; a Report Prepared for the Humanities Research Council of Canada*

(1964). *Resources of Canadian Academic and Research Libraries* was undertaken by Robert B. Downs for the Association of Universities and Colleges of Canada in 1967, reflecting the essential role of libraries in support of the academic mission. In 1975, Professor Tom Symons’ seminal *To Know Ourselves: The Report of the Commission on Canadian Studies* was published. Symons devoted a chapter to Canadian archives and the need for Canadians to be better aware of archival resources and the development of a national and regional plan to coordinate archival activity. The newly formed Social Sciences and Humanities Research Council carried forward Dr. Symons’ work with the influential 1980 report of their Consultative Group on Canadian Archives. These studies reflected the professionalization of library leadership and influence in national initiatives for a society seeking to understand its own culture and experience. More recently, the journal of the Association of Canadian Archivists, *Archivaria*, has been recognized as one of the leading international journals in the field. The writings of Hugh Taylor, Tom Nesmith, Terry Cook and Tom Delsey have advanced theory informed by practical experience. The InterPARES Project, led by Luciana Duranti has provided a productive research center for digital recordkeeping. The three volume *History of the Book in Canada* will stand as a celebration of its subject and the scholarship of a generation. (Eds: P.L. Fleming, Y. Lamonde, G. Gallichan, C. Gerson, J. Michon, and F.A. Black. University of Toronto Press, 2004–2006). Through the initiative of L’association des archivistes du Québec, the International Council of Archives and then UNESCO adopted the Universal Declaration on Archives, 2011. Two Canadians have served as President of the ICA: Jean-Pierre Wallot and Ian E. Wilson and Ingrid Parent served as President of the International Federation of Library Associations.

MAJOR LIBRARIES AND ARCHIVES

Library and Archives Canada/*Bibliothèque et Archives Canada*

Library and Archives Canada (LAC) is the country’s national library and national archives. This federal knowledge institution was created by the “Library and Archives of Canada Act” in 2004, amalgamating the former National Library and National Archives. This innovative integration resulted from the close collaboration between National Librarian Roch Carrier and National Archivist Ian E. Wilson. Parliament gave the new institution an ambitious mandate, seeking to ensure that the multimedia documentary heritage of Canada, from manuscript to print to electronic, is systematically acquired, preserved, and described and is as available as possible to all citizens. It strives to be “a source of enduring knowledge accessible to all, contributing to the cultural, social, and economic

advancement of Canada as a free and democratic society,”^[10] in the words of the legislative preamble. The vision was the creation of an integrated knowledge institution as a strategic response to the challenges of the twenty-first century. Ian E. Wilson was named the first librarian and archivist of Canada, responsible to the Minister of Canadian Heritage.

LAC incorporates all the functions of both a national library and a national archives, plus the portrait gallery of Canada and working in the context of the networks of libraries and archives serving communities throughout the country. Through consultation and coordination, the LAC is seeking to integrate holdings, services, description, and preservation to create a new type of comprehensive knowledge-based resource, relying increasingly on electronic means to deliver services. Coordinated acquisitions build on both legal deposit of print and electronic publications; the government recordkeeping programs; donations of the papers of prime ministers, artists, writers, and business and labor leaders; occasional purchases of Canadian documentary materials; agreements with broadcast media and filmmakers; and legal authority to preserve Canadian websites. The state of the art Preservation Centre in Gatineau, Quebec, across the river from Ottawa, opened in 1997 for the National Archives, provides a shared resource for secure storage and for conservation treatment. Nitrate photographic collections have now been accommodated in a new low temperature environment in a purpose-built building opened in 2011. And the extensive military service files of the twentieth century have been moved to a newly renovated secure storage building near the Preservation Centre.

The 2004 legislation and the ambitious vision for LAC remain to be realized. Financial pressures since 2009 have resulted in the loss of experienced staff, the reduction of the public exhibition programs, the cancellation of the building for the portrait gallery, the reduction of the interlibrary loan program, and the diminution of its international leadership role, together with service reductions and severe limitations on its website. The LAC’s budget was reduced by 10% between 2012 and 2015, eliminating some 215 staff positions. The Canadian Council of Archives (CCA), established in 1985, lost its funding base. The systematic digitization of significant Canadian content shifted to a consortium of research libraries through *Canadiana.org*. The LAC’s cataloging in publication program for Canadian imprints continues as do programs for reading and literacy for youth and persons with print disabilities. Information on its current policies and activities is available on its website: <http://www.collectionscanada.gc.ca>.

The reductions to LAC reflected a broader government policy closing or consolidating departmental libraries. In the period 2012–2014, departmental libraries serving Fisheries and Oceans Canada, Agriculture and Agri-food Canada, Environment Canada, Canada Immigration and

Citizenship, Canada Revenue Agency and Parks Canada, among others, were closed, or substantially constrained. Ministers explained that holdings were offered to others, often university libraries, before disposing of materials and the remainder “recycled in a ‘green way’.”^[11] It was expected that online services would be sufficient to replace professional library services. The full impact of these closures on research and on evidence-based governance has not yet been determined. For the first time in Canadian history, library and archives services became a partisan issue.

The changes alarmed the research community. Researchers and archivists came together in a unique Canadian Archives Summit in January 2014, with over 600 participating at the University of Toronto and across the country via live streaming. The Summit was intended as a creative participative process to engage allies and inform the two expert panels established by the Royal Society of Canada and the Council of Canadian Academies to study and make recommendations on the future of libraries and archives in Canada. Their reports were issued in November 2014 and February 2015, respectively. Both provided an eloquent and compelling defense of the continuing importance of memory institutions in a rapidly evolving content-rich, technology-enabled mobile society. Their reports stressed the changing context of information services encouraging leadership and collaboration in responding to the challenges and potential of digital technology coupled with public expectations for convenient access. Both were heavy laden with advice, with the Royal Society offering 70 specific recommendations to governments, institutions, and the professions. The Council of Canadian Academies discussed the available literature and drew on international initiatives to urge adaption to a digital environment, collaboration with others, and developing strong relationships with user communities. Both were thoughtful and strongly supportive but both were published in the final months of the then Conservative Government. Both provide useful inspiration and guidance for the future but neither organization launched an advocacy campaign and neither appears to have had a significant impact.

In both the library and archives communities, nationally and regionally, initiatives are increasingly led by consortia. Following the 2014 Canadian Archives Summit, a national working group continued the discussion, circulating a discussion paper *Canada’s Archives: A vision and areas of focus for 2015–2025*, and building on that, the institutions and associations formed the Steering Committee on Canada’s Archives (April 2016). The Canadian Association of Research Libraries (CARL) (www.carl-abrc.ca) has provided strong leadership in addressing the challenges of the digital era, supporting the Canadian Research Knowledge Network (www.crkn-rcdr.ca), providing university access to subscription-based scientific databases and the energetic *Canadiana.org* undertaking

large-scale digitization efforts are two such partnerships. As the federal government shifted resources to advance Open Government and establishing a public–private partnership, the Open Data Exchange (2015), CARL has effectively represented the library perspective.

Space permits examination of only a representative sampling of major Canadian libraries and archives. Many of these are examples of the increasing convergence that is occurring with knowledge and documentary heritage institutions and educational programs.

Bibliothèque et Archives nationales du Québec

Under the dynamic leadership of its first president, Lise Bissonnette, the *Bibliothèque et Archives nationales du Québec* (BAnQ) has been through a major process of transformation and development over the last decade. In 2006, a new provincial legislation took effect that created the BAnQ by combining the former *Bibliothèque nationale du Québec* (BNQ) and the *Archives nationales du Québec*. This had been preceded in 2002 with legislation that combined the functions of a national library (legal deposit, national bibliography, preservation of Quebec imprint materials, and other services) with the public service functions of the municipal library in Montreal. The public face of this institution was given an enormous profile with the opening of a major new building in 2005 for public services in Montreal. The building, called *la Grande Bibliothèque*, was the result of an international architectural competition and provides an impressive new flagship for library services.

Legal deposit of materials published in Quebec started with the creation of the BNQ and the passing of regulations for legal deposit, which took effect in January 1968. The *Règlement sur le dépôt légal* required the deposit of two copies of books, pamphlets, newspapers, periodicals, artists' books, and sheet music. In 1969, the "*Bibliographie du Québec*" started as the bibliographic record of everything that was published in the province. In 1992, legal deposit was extended to prints, posters, reproductions of works of art, postal cards, sound recordings, software, and microforms.

The BAnQ is located in a number of buildings throughout the province. A preservation center was inaugurated in 1997 in Montreal. The building houses technical services staff together with a number of vaults with stringent environmental controls to support the long-term preservation of one copy of Quebec imprint materials received under the legal deposit requirements of their legislation. Archival services are headquartered in Quebec City, in a beautifully renovated heritage building adjacent to the Université Laval campus, and in Montreal in another renovated heritage building. Regional services are provided through a network of centers located in nine major population areas in the province. BAnQ offers expert and effective leadership for libraries and archives throughout

Quebec and at the international level, especially in "La Francophonie."

The Provincial Archives of Quebec/Bureau des archives du Québec had been established in 1920. The BNQ had been created by the Province of Quebec in 1967. The BNQ inherited the collections and the building (*la bibliothèque Saint-Sulpice*) used to house the collections created by a religious order in 1915 and purchased by the Quebec government in 1941. The public library of the City of Montreal had been started in 1917 and included the Phileas Gagnon collection of Canadiana. The fusion of the collections and services of these diverse library and archival institutions has resulted in the creation of one organization dedicated to the acquisition, preservation and making known Quebec's published and archival heritage. For further information see the BAnQ's website at <http://www.banq.qc.ca>.

BAnQ and LAC have developed a close working relationship, respecting the national roles each performs. This was exemplified as they cohosted first the annual roundtable (CITRA) of the International Council on Archives in 2007 and then more than 3000 librarians attending the annual conference of the International Federation of Library Associations in 2008.

National Science Library Formerly the Canada Institute for Scientific and Technical Information (NRC-CISTI)/Institut Canadien de l'Information Scientifique et Technique (ICIST-CNRC)

The Canada Institute for Scientific and Technical Information (NRC-CISTI) has been recognized as Canada's National Science Library (NSL), as an integral part of the Knowledge Management Division in the National Research Council (NRC). It holds extensive print and electronic information resources in all areas of physical and life sciences, technology, engineering, and health sciences. Canada's NRC was founded in 1916 in the midst of World War I, and a librarian hired in 1917. Margaret Gill, the first chief librarian, was appointed in 1928 and through almost three decades of service developed the collections, the services, and the reputation as the basis for the NSL. The NRC Research Press started in 1929 and merged with CISTI in 1994 but in 2010 became a private company, Canadian Science Publishing.

Budget reductions and organizational changes have substantially impacted collections development and required new approaches to service delivery. While innovation and technology have always been major forces at NRC-NSL, these have been tested in the past few years. Working as a key partner with six other government's science libraries, NRC-NSL has helped establish a digital repository and coordinated acquisitions and has implemented both mobile services and a broad federated search system to facilitate public use. While headquartered in Ottawa in a purpose-built building opened in 1974, it

provides services across the country linked with installations of the NRC so that in Vancouver it is part of the NRC Institute for Fuel Cell Innovation and in St. John's, Newfoundland, with the NRC Institute for Ocean Technology.

Library of Parliament/*Bibliothèque du Parlement*

The Library of Parliament traces its roots to the legislative libraries established in the 1790s for Upper and Lower Canada (now the provinces of Ontario and Quebec) and the subsequent legislative library created in 1841 for the United Province of Canada. Moves of Parliament and its Library to different Canadian cities as well as fires in 1813 (fire started in York, now Toronto, by invading American troops in the War of 1812), 1849, and 1854 meant that many materials were lost or destroyed by the time the permanent home of the Library of Parliament in Ottawa was opened in 1876. The circular building is famous for its distinctive Victorian Gothic architecture with its flying buttresses, stone exterior, and ornamental ironwork. It was designed by architects Thomas Fuller and Chilion Jones with the active involvement of the first parliamentary librarian, Alpheus Todd. Fires continued to dog the Library with the Centre Block of the Parliament Buildings burning down in 1916 (with the miraculous exception of the Library that was separated by a fire corridor) and in 1952 when thousands of books were water damaged. The magnificent Victorian structure has recently reopened after a 4-yr restoration and expansion project.

For many years until the creation of the Canadian Bibliographic Centre in 1950 and the National Library of Canada in 1953, the Library of Parliament acquired collection materials in anticipation of a national library being established. Then when the National Library was established, over 250,000 volumes and a large collection of print newspapers were transferred from the Library of Parliament. The Library of Parliament served as a deposit for materials being registered for copyright purposes in Canada. The first legislation requiring deposit for copyright registration purposes was in 1832 with the then Legislative Library in Lower Canada. Then in 1841 copyright deposit was required with the Legislative Library of the United Province of Canada and confirmed in 1868 with the new Library of Parliament of Canada. The materials required for deposit included books, maps, charts, musical compositions, photographs, prints cuts, and engravings. This provision for copyright deposit remained in place until 1921 and then returned in 1931 until 1969. From 1885 to 1956, there were two equal administrative heads of the Library, an English-speaking parliamentary librarian and a French-speaking general librarian. This arrangement ended in 1956.

In a parallel with the development of substantial collections and in the absence of a national library, the Library of Parliament was open for use by the general public until 1961 when access became limited to

parliamentarians, the governor general of Canada (Canada's head of state), members of the Privy Council, justices of the Supreme Court, and members of the Press Gallery. Since that time, the focus has been on the development of collections and specialized research and reference services in support of the House of Commons and the Senate of Canada. It has an important rare book collection including a set of John James Audubon's *Birds of America* and early Canadian, British, French, and American imprints of note. The Librarian of Parliament is an officer of Parliament. The "Parliament of Canada Act" includes provisions for the appointment of the parliamentary librarian and an associate parliamentary librarian. This legislation dating from 1988 replaces a previous standalone "Library of Parliament Act" whose roots date back to 1802.

The Library has a wide range of responsibilities. Staff from the Library support the information and research needs of individual members of the House of Commons, senators, and parliamentary committees and groups. PARLMEDIA is an important media monitoring service, among many Web services provided to parliamentarians. The Library has an extensive publishing program that is made available to the public. The former Research Branch of the Library (now the Information and Document Resource Service) was an important initiative created by parliamentary Librarian Erik J. Spicer, parliamentary librarian from 1960 to 1994. There is also a position of parliamentary budget officer within the Library. The mandate of this office is to provide objective analysis to the Senate and to the House of Commons about the state of Canada's finances and trends in the national economy, to undertake research into the nation's finances and economy, and to provide estimates of the costs of proposals contained in legislation introduced by Members of Parliament. The Parliamentary Poet Laureate with eminent poets serving for 2-yr periods is part of the Library's responsibilities. In addition, the Library is responsible for educating the general public about the institution of Parliament and for giving orientations and tours to visitors to the Parliament Buildings in Ottawa.

Archives of Ontario/*Archives Publiques de l'Ontario*

The Archives of Ontario was established in 1903 as the Bureau of Archives. It preserves extensive collections for the study of the history and people of the Province of Ontario, Canada's largest province. Holdings include official records of the Ontario Government, and original source documentation on Loyalists, African-Canadian settlement, various cultural communities, provincial politics, and business and labor organizations, as well as key sources for genealogy and records relating to indigenous peoples. It also has a large collection of vital statistics materials largely now online. There are significant

collections of photographs (1,700,000), documentary art, architectural records (200,000), and cartographic records (40,000). Ontario Government records include land, court, and business registrations and the records of the Premiers of Ontario and many of their ministers. In terms of cultural archives, it holds records from some 2600 private individuals, businesses, clubs, and associations, the archives of large national businesses such as the T. Eaton department store chain and impressive architectural archives.

The Archives legislative mandate was renewed in 2006 with an emphasis on recordkeeping within the government. The Archives moved from downtown Toronto into its impressive new facility on the campus of York University in 2009. This has enabled a renewed public exhibition program and improvements to services for academic researchers and genealogists.

Bibliothèque de l'Université Laval

The University was founded by the *Séminaire de Québec* in 1852 that made its collection of some 15,000 volumes available to the new university. The two institutions continued to make their collections available together until the University moved in 1964 to its current campus at Sainte-Foy and the collections were separated. Collections exceed five million documents that include subscriptions to some 24,000 newspapers and serials of which almost 18,000 are electronic. There are 450 databases available on the Web. They have 20,000 sound recordings and 216,000 slides; 1.3 million microforms; 16,500 films, videos, and DVDs; more than 5,000 atlases; and 125,000 maps. More than half of the 2015–2016 collection budget of \$12.1 million (Canadian) is dedicated to the acquisition of electronic resources. The Library has been a pioneer in the digitization of materials and making digital resources available on the Web. It has worked in collaboration with the libraries at *Université de Montréal* and the *Université du Québec à Montréal* on an important project called *Érudit* (www.erudit.org). The consortium's mandate is to provide a digital platform to assist in the transition and free circulation of more than 150 scholarly social science and humanities journals available and to support the world of scholarly publishing in French. They are also partners in *Nos Racines/Our Roots*, a national project to digitize local and regional history materials. This project is carried out in partnership with the University of Calgary, Dalhousie University, and the University of Toronto. They have also been an early collaborator with LAC's Theses Canada program to produce electronic theses, which then form part of the Theses Canada Portal and the Networked Digital Library of Theses and Dissertations (NDLTD). Also in partnership with LAC has been Laval's ongoing development of *Répertoire de vedettes-matière* (RVM), which provides access to more than 200,000 French subject headings and their English equivalents and is used in libraries around the world.

Bibliothèques de l'Université de Montréal

The *Direction des bibliothèques* at the *Université de Montréal* is made up of some 18 libraries and one associated library. It has collections of over four million documents and serves a number of professional faculties in areas such as library and archival science, medicine, and law, as well as humanities, social sciences, and science to students in the French language. Special collections of note include the Collection Gilles-Blain of Jean Cocteau, the Collection Louis-Melzack, and the Collection Baby, which include important early Canadian materials.

McGill University Library

McGill College was incorporated in 1821 and included a library for the Medical School. It was not until 1843 that a Faculty of Arts was in place, and in 1855 a library for the college opened with slow growth of collections primarily through donations. In the 1890s, land was donated for a library by J.H.R. Molson and funds provided for a building as well as ongoing maintenance and salaries by Peter Redpath. With a new building came centralized ordering by the library and adoption of the Cutter classification scheme under the direction of Charles H. Gould, McGill's first full-time university librarian. By 1894 there were 54,000 volumes in the main library and departmental libraries and in 1898 some 90,000 volumes. By 1898 it had collections of an almost complete set of Canadian documents dating from 1840 and publications of five provinces. An early president of the American Library Association and friend of Charles Cutter and Melvil Dewey, Charles Gould promoted the idea of the annual conference of the American Library Association being held in Montreal. This took place in 1900 and brought many Canadian and American librarians together for the first time. Gould also pioneered the publication of McGill University Papers that were used for exchange purposes by the Library and as well promoted the research carried out within the University. He is also known for the establishment of a traveling libraries project in 1901 where small collections of special materials were made available to villages, towns, and rural areas where library services were unavailable.

Today, McGill University Library is known for the quality of its rare collections including a William Blake collection, the Lawrence Lande Canadiana Collection, a collection of Napoleon-related materials, the Redpath Tracts, a collection of some 20,000 British tracts and pamphlets, and the Osler Library of the History of Medicine. It has over six million items in its collections including almost one million electronic books and 38,000 electronic journals. It operates 13 branch libraries and several specialist collections open to the public. Like other university libraries, it is fostering the growth of electronic theses, digitizing increasing amounts of its analog collections,

and actively seeking ongoing financial resources for the library.

Toronto Public Library

Canada's largest public library system traces its roots to the York Mechanics' Institute founded in 1830 established "for the mutual improvement of its members in useful scientific knowledge. . . A library of reference and circulation will be formed." It now has some 100 branches and 11 million items in its collections. In 2015, the library recorded 18 million visits on site plus 31 million virtual visits. The significant progress of the TPL can be measured in some ways by the growth of its buildings as public spaces from a major building built in 1861 with a lecture theater, reading room, and music hall to the enormous support that Andrew Carnegie gave the TPL. In 1903, funds were received from Carnegie that paid for a new central library and three branches to be built. This was followed in later years by funds for another six branches for Toronto. In the greater Toronto area, Carnegie supported the construction of another 10 public libraries and one university library (Victoria College, University of Toronto). The Toronto Reference Library is a major landmark opened in 1977. Seventy percent of the city's population uses the library. The system now bills itself as "the world's busiest urban public library." (<http://www.torontopubliclibrary.ca/media/key-facts/>)

The TPL branches have research and reference libraries serving the whole city, district libraries serving large areas, and smaller neighborhood libraries. Examples of the research and reference libraries with extended hours for extensive research and reference would be the Toronto Reference Library and the North York Central Library. There are some 17 district branches in medium-sized buildings that normally have collections of more than 100,000 items and multilingual materials for the communities in the particular area. There are 78 TPL libraries designated as neighborhood branches with smaller collections. Some of the collections for which TPL is noted include the Osborne Collection of Early Children's Books; the Merrill Collection of Science Fiction, Speculation and Fantasy; and the Arthur Conan Doyle Collection, all of which are supported by their own friends' organizations. The Toronto Public Library Foundation raises funds for endowments and for particular initiatives such as the Toronto Dominion (TD) Summer Reading Program and Keep Toronto Reading Program. Collections in many languages serving a very diverse population and innovation in Web services such as the Virtual Reference Library/*Bibliothèque de Référence Virtuelle* and KidsSpace are hallmarks of this rapidly evolving institution.

The success and strong public support for the TPL is indicative of the essential role played by municipal public libraries across the country. Ontario, for example, decided in the 1980s not to build a provincial library but to link

more than 1000 public library branches as a provincial library network, reinforced by support services, electronic connections, and interlibrary loan. Impressive new public libraries have been built by progressive municipalities concerned about the quality of life and access to knowledge. These cities include Vancouver, Halifax, Winnipeg, Edmonton, Calgary, and, in 2020, Ottawa.

University of Alberta Libraries

The University of Alberta celebrated its 100th anniversary in 2008. Its library is the third largest research library collection in the country. The chief librarian has the responsibility of the University of Alberta Libraries, Museums and Collections Services, as well as the University of Alberta Archives and Records Management, the Bookstore, Printing and Duplicating Services, and the University of Alberta Press. The University of Alberta Libraries include the Bruce Peel Special Collections Library, the Data Library, and a Music Library. Collections of note in the special collections library include the papers of the legendary Mountie, Sam Steele, the Alberta Folklore and Local History Collection, a Dime Novel Collection, and the Pierre Ouyard Collection of some 300 fine bindings. There is also the Book and Record Depository (BARD). The BARD is a facility modeled on the Harvard Archives Depository, which opened in 1994 to house lesser used materials of the University and those of other institutions. With a capacity for 3.2 million books and almost 40 km of shelving, it is located in a former big-box store that was converted for collection storage purposes with constant temperature and humidity levels.

The University of Alberta Libraries has taken the lead in making regional publications available in digital form such as through the Peel's Prairie Provinces site, which makes available Bruce Peel's *Bibliography of the Prairie Provinces*, as well as the contents of many of the items from the bibliography and a wealth of other materials celebrating the history and culture of the Canadian Prairies.

University of British Columbia Library

The UBC Library has the second largest research library collection in Canada. It has more than 20 branches and divisions including the recently established UBC Okanagan Library. The main library was renovated with the addition of the Irving K. Barber Learning Center in 2009. The collections of special materials include the Wallace B. Chung and Madeleine H. Chung Collection of rare materials related to the discovery of British Columbia, the development of the Canadian Pacific Railway, and Chinese immigration to Canada. Its collections total more than 5.5 million volumes with some 260,000 e-books and more than 65,000 serial subscriptions. It has a number of important digital collections including its Bookplate

Collection, collections of photographs (Japanese–Canadian Photograph Collection, MacMillan Bloedel Photograph Collection, Peter B. Anderson Photograph collection, and the Rosetti Studios–Stanley Park Collection), and the UBC Historical Documents Collection, which includes copies of important records and publications documenting UBC’s history. It has established cIRcle, UBC’s information repository (www.circle.ubc.ca), which is an open-access repository for published and unpublished research, teaching, and other materials created by the UBC community.

University of Toronto Libraries

The University of Toronto Library houses the largest research library collection in Canada and third largest in North America after Harvard and Yale. The University of Toronto Library is made up of 44 libraries located on three university campuses. The Library dates from the opening of the University of King’s College in the former parliament buildings in Toronto in 1841. In 1849, the university was secularized and the name changed to the University of Toronto. In 1850 the Library had approximately 4500 volumes, and as of 2015, it had holdings of 12 million books and 160,000 serials, 5.4 million microforms, and 1.9 million CD-ROMs, computer files, manuscripts, cartographic materials, graphic materials, sound recordings, film and videos, and other materials with a collection budget of some \$31.8 million (Canadian). It has major partnerships with the U.S.-based Internet Archive and the Microsoft Corporation to digitize collection materials and was a founding member of the international Open Content Alliance. It has also scanned materials out of copyright from other institutions. It provides access to more than 28,000 full-text electronic journals, almost 900 indexes and abstracts, over 350,000 electronic books, and over 3000 electronic newspapers. The University of Toronto Archives and Records Management Services is a part of the Library. Its distinctive John P. Robarts Research Library for social sciences and humanities resources was originally designed by Mathers and Haldenby of Toronto and has recently been renovated to include a large Information Commons. It also houses the Thomas Fisher Rare Book Library, which includes major collections of Canadian holdings including the Northwest and the Arctic maps and atlases as well as Canadian poetry, fiction, and drama. The intention with the latter is to be comprehensive in all editions and translations as well as literary manuscripts from past and present icons of Canadian culture including Northrop Frye, Margaret Atwood, and Leonard Cohen.

Vancouver Public Library

The Vancouver Public Library (VPL) dates from 1869 with the start of the New London Mechanics Institute,

later renamed the Hastings Literary Institute. It is the third largest public library system in Canada. Over 10 million items are borrowed each year and a million reference requests answered. Its landmark central branch, Vancouver Library Square, opened in 1995 and was designed by architect Moshe Safdie. The Central Library succeeded an earlier Carnegie building opened in 1903 and a later building in 1957. The Vancouver Library Square building, which seats some 1200 patrons, includes retail space as well as a day care. The VPL has 22 branches. The VPL serves a diverse multilingual community. It maintains collections in languages other than English such as in Chinese, Farsi, German, Hindi, Italian, Japanese, Korean, Polish, Portuguese, Punjabi, Russian, Spanish, Tagalog, and Vietnamese. The use of the library as public space is important with library facilities being used for a wide variety of purposes. It has a number of innovative programs—One Book, One Vancouver, a citywide book club, is an example together with its leadership role in the AskAway program, a province-wide virtual reference service. It has a writer in residence and hosts the Vancouver’s Poet Laureate.

LIBRARY AND ARCHIVAL ASSOCIATIONS AND GROUPS

Canada has a wide range of national and provincial and territorial associations and groups who support libraries, archives, librarians, library technicians, and archivists. National associations and groups include the following:

Canadian Association of Research Libraries/ *Association des Bibliothèques de Recherche du Canada*

The CARL is a national association with institutional members made up of 27 major Canadian university libraries as well as LAC, the NRC’s National Science Library, and the Library of Parliament. Established in 1976, most of CARL’s member universities offer doctoral programs in both the arts and the sciences. Its Mission is “to increase the capacity of individual member libraries to be effective academic partners in support of research and scholarship at the national, regional and local levels.” It has a number of committees in place for copyright, effectiveness measures and statistics, government policies and legislation, and scholarly communication. It has working groups for data management, e-learning, and library education. CARL plays strong national leadership and advocacy roles in areas such as copyright, open access to digital resources, and digitizing cultural resources. *A Canadian Approach to Digital Copyright* was published in 2008 focusing on key copyright reform issues including fair dealing, damages and fair dealing, technological protection measures, and education use of

the Internet. It has been instrumental in obtaining financial support from the federal government for the indirect costs of research that its members provide in support of research undertaken at their university. In the absence of a national program for library statistics, it collects important data on collections, budgets, and expenditures from its members. CARL's Education Working Group has surveyed members to develop a set of national research priorities including how to move institutional repositories to become Trusted Digital Repositories, open access and the impact of new technologies on delivering library services, and the rationalization of print collections. They have also taken the lead in the LibQUAL Canada Project to assess the quality of services provided in CARL and other academic libraries. CARL has also taken an active leadership role in advancing cooperative initiatives for the systematic digitization of unique Canadian documentary content and in providing access to digital resources internationally through the Canadian Research Knowledge Network.

Canadian Federation of Library Associations (CFLA)/Federation Canadienne des Associations de Bibliothèques (FCAB), Formerly the Canadian Library Association/Association Canadienne des Bibliothèques

The Canadian Library Association (CLA) was a national voice and advocacy organization for the Canadian library community. Founded in 1946, it was dissolved in 2016. The Association replaced the earlier Canadian Library Council, which had been established with Carnegie Corporation and Rockefeller Foundation's financial support. Its first priority was to lobby for the establishment of a national library for Canada. CLA also continued work that the Canadian Library Council had begun to microfilm significant Canadian newspapers first with funding from the Rockefeller Foundation and later from other sources such as the Canada Council. The *Canadian Index to Periodicals and Documentary Films* later the *Canadian Periodical Index* and important directories and other publications followed. Over the past decade, increasingly active provincial and other library associations and declining membership resulted in the CLA being unable to continue as a viable organization.

After months of consultation, discussions, and recommendation, a proposal was presented in the fall of 2015 to dissolve the CLA, and in May 2016 the CFLA/FCAB was formally incorporated. The new organization represents eighteen Canadian member associations and will transition a number of the CLA's activities. The CFLA/FCAB brings together the provincial, territorial, and national associations across Canada and will focus on a unified and coordinated voice for the Canadian library community on both national and international issues. Its purpose is to advance library excellence, champion library values and

the value of libraries and to influence national and international public policy impacting libraries and their communities. Key priorities for the new organization include continuing the building of the new federation, copyright review, and international representation.

L'Association pour l'Avancement des Sciences et des Techniques de la Documentation (ASTED)

ASTED is the national association of French language librarians and libraries. It was founded in 1973 based on the earlier *Association canadienne des bibliothécaires de la langue française* and the *Association canadienne des bibliothèques catholiques*, established in 1943. Its mandate is to promote excellence in the services and personnel of libraries and information and documentation centers as well as to promote the interests of libraries to governments and to represent the interests of North American French library science. It has an advocacy role at the provincial level primarily with the Province of Quebec and at the federal level with the Government of Canada. Federally, it speaks on issues such as copyright and the Library Book Rate. It has two periodicals, *Documentation et bibliothèques* issued quarterly and *Nouvelles de l'ASTED* issued five times a year. It has an important annual conference and publishes a wide range of professional literature ranging from the French editions of AACRII and Dewey to a union catalog of serials in Quebec health libraries. It also provides ongoing professional development.

Provincial and Territorial Public Library Council (PTPLC)/Conseil Provincial et Territorial des Bibliothèques Publiques (CPTBP)

This Council is made up of the directors of public library services in Canada's provinces and territories. Established in 1978, it was formerly known as the Provincial and Territorial Library Directors Council (PTLDC). Given the diversity of provincial and territorial legislation and programs for libraries, the agencies represented on PTPLC vary in their mandates and responsibilities. The Council exists to provide a vehicle for sharing information on policy issues and development for public library services and to act collaboratively on national issues such as literacy, services to aboriginal communities, the library book rate, persons with disabilities, and resource sharing. It facilitates cross-jurisdictional initiatives and serves as a point of contact with national library organizations and the federal government. In 2005, the PTPLC commissioned a major examination of the role of public libraries called "Public libraries in the priorities of Canada: Acting on the assets and opportunities." The PTPLC reports to a committee of provincial and territorial deputy ministers responsible for public libraries and facilitates meetings of federal, provincial, and territorial ministers responsible for public libraries.

Canadian Urban Libraries Council (CULC)/ Conseil des Bibliothèques Urbaines du Canada (CBUC)

The CULC is a national organization of Canada's largest public library systems, serving more than 40% of Canada's population. Each system serves a city of more than 100,000 people. It was formerly called the Council of Administrators of Large Urban Public Libraries (CALUPL). The organization's mission is "To work collaboratively to build vibrant urban communities by strengthening the capacity of Canada's urban libraries." Its priority issues include social inclusion of new immigrants, established multicultural groups, and youth for which it has developed an Urban Library Social Inclusion Audit for the use its members, youth and civic engagement, organizational cultural changes, and technology. It is building an Urban Library New Immigrant Programs and Services Inventory. The CULC has an advocacy role on behalf of libraries in areas such as federal copyright reforms, open access, and service standards. CULC took over the administration of the former CLA's Library Materials Shipping Tool and leads the advocacy of e-books access and pricing issues.

CULC was instrumental in the establishment of LibraryNet, a program of the federal government, to provide public Internet access with a report called "Connecting Canadians." When LibraryNet was ending in 2004, CULC responded with "Sustaining Canada's Digital Capacity: An Urban Library Strategy to Sustain Socially Inclusive ICT Networks." It collects and publishes the *Canadian Public Library Statistics* and a separate *Branch Library Activity Statistics* on an annual basis. These provide important data on expenditures, revenue sources (provincial, municipal, others), collection budgets, size of collections, number of professionals and other staff, use of electronic resources, numbers of registered users, in-person visits, number of locations, and populations served for members of CULC and other library systems that are not members. While public libraries are the responsibility of Canadian municipalities, the Council provides a forum for the discussion of the issues facing large public libraries—literacy, digital literacy, resource sharing, equity of access through public Internet facilities, social cohesion, services to aboriginal peoples, and services and meeting the information needs of an increasingly multilingual and diverse population.

Canadian Council of Archives/Conseil Canadien des Archives

The CCA was founded in 1985 to encourage and facilitate the evolution of an archival system in Canada. A national organization, it has representation from provincial and territorial archival councils, LAC, the Association of Canadian Archivists (ACA), and the *Association des*

archivistes du Québec. The Council has a mandate to improve the administration and effectiveness and efficiency of the Canadian archival system and to identify national priorities. It has a number of Standing Committees and Working Groups for Standards, the Canadian Committee on Archival Description, Copyright, and Preservation. It had several funding programs supported by the federal government—including the Control of Holdings Program, the Professional Development and Training Program, the Special Projects Program, the Conservation Plan for Canadian Archival Records (CPCAR), and Preservation Management Program coupled with a training program. With support from the provincial councils, the CCA funded traveling archives advisors to encourage local institutions and their communities in preserving their archives. The CCA led the development of ArchivesCanada.ca as the national portal to access the holdings of more than 800 archives. This includes virtual exhibits, as well as digitized photographs, maps, and documents in projects supported by the former Archival Community Digitization Program. Federal funding for the CCA and the National Archival Development Program was canceled in 2012. With support from the archival community, the CCA has persevered and refocused and maintains the national database of archives holdings: <http://www.archivescanada.ca>.

More recently, the CCA has launched the ARCHIVESCANA Digital Preservation Service to provide memory institutions with an affordable digital preservation service maintained in an environment to ensure sustainability, long-term accessibility, usability, and authenticity of electronic records and digital information objects.

Steering Committee on Canada's Archives (SCCA)

Following the January 2014 *Canadian Archives Summit: Towards a New Blueprint for Canada's Recorded Memory*, organizers continued to develop the ideas and deliberations raised during the Summit though the annual meetings of the CCA, the ACA, and the *Association des archivistes du Québec* (AAQ). Building on the discussions over the summer of 2014, the ACA, AAQ, CCA, and the Council of Provincial and Territorial Archivists (CPTA) and LAC came together as a working group in September 2014 to develop a renewed vision and road map to guide the Canadian Archival System. A draft Strategy entitled *Canada's Archives: A vision and areas of focus for 2015–2025* was circulated for comment in the summer of 2015 with the final version of the Strategy launched at a national event in Ottawa that November. The SCCA was established to guide the implementation of the Strategy with representatives from each of the ACA, AAQ, CCA, CPTA, and LAC.

Association of Canadian Archivists (ACA)

The Association was established in 1975 and evolved from the Archives Section of the Canadian Historical Association. It has a number of standing committees such as education, membership, ethics, and public awareness. Special interest sections provide a forum for discussion in areas such as aboriginal archives, privacy and access, government records, municipal archives, technology and archives, personal archives, religious archives, sound and moving images, and university and college archives. It seeks to provide leadership, encourage awareness of archival activities, advocate on behalf of the needs of professional archivists, and communicate to further understanding and cooperation among members of the Canadian archival system and other information and culture-based professions. In addition to organizing a major annual conference, it publishes a newsletter, the *ACA Bulletin*, as well as *Archivaria* and monographs and occasional papers. Back issues of *Archivaria*, one of the leading English language archival journals in the world, are available online.

Association des archivistes du Québec/Association of Archivists of Québec (AAQ)

The Association was founded in 1967 and reflects the distinctive qualities of the archival discipline, history, and profession in Québec, Canada's francophone province. The AAQ represents more than 600 members: archivists, archival educators, and information specialists who work in both public and private sector organizations. The unique nature of the Québec archival practice marries both European archival theory and practices with the North American methodology and profession of records management.^[12] Joining management and conservation of historical archival documents with the document life cycle is reflected in both Québec archival discipline and the pedagogy developed and taught in the curricula used in university archival education programs. The Québec archival system is also characterized by its decentralization: archival records are managed and stored in the regions where they have been created.^[13]

The AAQ publishes a biannual publication *Archives*, established in 1969, which focuses on scholarly research and reflections on the theory and practices of the archival and information management professions in Québec.

Canadiana.org

Canadiana.org is a national not-for-profit organization that was established in 1978 with its initial funding coming from the Canada Council for the Arts. It was set up in response to concerns from librarians and scholars about the preservation of Canada's earliest printed heritage, as well as increased demands to have access to these

materials for research and study purposes for Canadian Studies programs. Since its establishment, it has completed several large projects to locate and film (to preservation standards set out the *Guidelines for Preservation Microfilming in Canadian Libraries*) and produce bibliographic descriptions of these materials. This national initiative has had the effect of pulling together Canada's early published materials, some unique, some deteriorating, from scattered collections in libraries and archives in Canada and abroad and making this content available through subscribing institutions. For the past 15 yrs, Canadiana.org has focused on shifting its method of access from microform to digital. With assistance from the Andrew W. Mellon Foundation and working in partnership with the then National Library of Canada and the libraries of the University of Toronto and Université Laval, it began its Early Canadiana Online project. With the support of its members, primarily research libraries and the Department of Canadian Heritage, it has completed a major digitization project, Canada in the Making, to make pre-1900 Canadian official publications available on the Internet. It successfully completed another multiyear digitization project, Early Canadian Periodicals to 1920. In 2008 Canadiana.org merged with AlouetteCanada.ca, a national collaborative initiative on the part of Canadian research libraries and LAC. AlouetteCanada.ca, in turn, had absorbed the work of the Canadian Initiative on Digital Libraries (CIDL), a collaborative effort to coordinate digitization projects and standards in Canada. Canadiana.org will be the focus of major projects to aggregate current digitized contents and to digitize Canada's rich cultural heritage including materials from libraries, archives, and museums. With the sustained support from the CARL and a contract with the LAC, Canadiana.org is embarking on an ambitious initiative. The Héritage Project is a 10-yr commitment to digitize and make accessible online some of Canada's most popular archival collections encompassing roughly 60 million pages of primary-source documents.

DEVELOPMENT OF CANADIAN LIBRARY AND ARCHIVAL EDUCATION

Formal library and archival education takes place at a wide range of institutions across Canada. The year 2004 marked the 100th anniversary of the first formal library education program in Canada. Prior to that time, librarians and archivists learned through experience or through attendance at courses in the United States. Charles H. Gould, the then university librarian at McGill University, laid the groundwork for early librarian education in Canada. He started with an in-house training course for staff, which was also open to outside applicants. This was followed with the first McGill University Library Summer School in 1904, which was directed to people that were

already in the workforce. There was a curriculum consisting of classification; cataloging; accessioning; shelving, charging, and ordering systems; reference work; and bibliography and included lectures, field trips, and special lectures including those delivered by Melvil Dewey and James Bain, the chief librarian of the TPL. Courses were in place from 1904 to 1911 and then in 1913 and 1914. Stimulated by the McGill experience, Ontario's Department of Education began to offer similar summer programs in 1911 in Toronto. The program in Montreal evolved to summer programs in 1927 at McGill accredited by the American Library Association then to a sessional graduate Bachelor of Library Science program at McGill University in 1930. In Toronto, a one-year academic program for university graduates leading to a Bachelor of Library Science at the Library School was jointly administered by the University of Toronto and the Ontario Department of Education and the Ontario College of Education in 1937. In 1937, the *École de bibliothéconomie* at the *Université de Montréal* was established for French language education. The University of Ottawa opened a bilingual French and English evening program for librarians in 1938 that evolved to offering a Bachelor of Library Science program in 1942.

Due to the rapid expansion of libraries in the 1960s, new graduate program library schools were created at the UBC (1961 School of Librarianship), University of Alberta (1965 School of Library Science), University of Western Ontario (1969 School of Library and Information Science), and Dalhousie University (1969 School of Library Service). The program at the University of Ottawa, *École de bibliothécaires/Library School*, closed in 1972. Carleton University began to offer a Canadian archives training course in 1959 that became a 6- to 8-week program at the Public Archives in 1969. Graduate librarian programs were accredited (and continue to be accredited) by the American Library Association. Over the last 50 years, these programs have evolved from offering Bachelor of Library Science (as a graduate degree program) to a 2-yr Master of Library Science degree program as well as doctoral programs. Changes to the programs and names of the various faculties reflect more specialization and the inclusion of other disciplines and a broader view of information management. The UBC introduced a Master of Archival Studies (MAS) program in 1981 as part of what became known as the School of Library, Archival, and Information Studies in 1984. They also introduced a First Nations concentration in 1998 and a Master of Arts in Children's Literature program in 1999. Today, the University of Toronto has a Faculty of Information with a Master of Information degree program, including eight areas of concentration together with a PhD program and a Master of Museum Studies program. Similarly, what is now the *École de bibliothéconomie et des sciences de l'information* at the *Université de Montréal* offers a Master of Information Science degree program, a doctoral program, and certificates in Archival

Studies and Digital Information Management. The program at the University of Western Ontario, now Western University, is combined with journalism as the Faculty of Information and Media Studies. The UBC was exploring a similar approach in January 2017. McGill University's program is now the School of Information Studies and offers areas of specialization in archival studies, knowledge management, and librarianship. The history department at the University of Manitoba established a master's degree program in archival studies in 1991. Finally, a new graduate program, the School of Information Studies, was launched at the University of Ottawa in 2009 as a bilingual program designed for students who want to work in the fields of archives, librarianship, and information centers.

The development of library technician programs mirrored the rapid expansion of libraries, graduate library programs, and the opening of community colleges across the country. In the late 1960s and early 1970s, library technician programs were opened at Red River Community College in 1962 in Winnipeg, Vancouver City College (now Langara College) in 1966, Southern Alberta Institute of Technology in Calgary in 1967, and Ryerson Polytechnical Institute in 1967 in Toronto. In Ontario a number of colleges of Applied Arts and Technology established programs at the same time. St. Clair College of Applied Arts and Technology and Seneca College of Applied Arts and Technology were the first in 1967. Core competencies were defined by the CLA in 1982 with their *Guidelines for the Training of Library Technicians*. There are currently programs in place in three Ontario community colleges down from a peak of eight institutions in the late 1980s, which reflect a number of closures of technician programs in the early 2000s. These colleges in Ontario were matched by a similar province-wide development of *Collèges d'enseignement général et professionnel* (CEGEPs) in the Province of Quebec intended for graduates of secondary schools. There are now some 48 CEGEPs in all regions of the province, primarily offering their courses in French with library technician programs in place in seven of these. The Nova Scotia Community College's program began in 1985. Core competencies for library technicians working in school libraries were defined in CLA's *Qualifications for Library Technicians Working in School Systems*. Library technician programs are also in place primarily to support the training of teacher-librarians at the University of Winnipeg, Lakehead University, Concordia University, Memorial University of Newfoundland's School of Continuing Education, and the University of New Brunswick's Library Assistant Program. Normally, these training programs are for 2 years.

THE CANADIAN LIBRARY AND ARCHIVAL LANDSCAPE: CHALLENGES AND ISSUES

Canada's archives and libraries share a range of issues and challenges. These include dealing with an increasingly

digital environment, preservation, access, description and resource discovery, and management of government information. The continuing issues are of standards development, copyright, resource sharing, national planning, and coordination; the revitalization and replenishment of their professional ranks; convergence; working collaboratively; serving both increasingly diverse multicultural populations and indigenous peoples; and providing services for people with disabilities. Canadian libraries have some challenges and issues that archives do not share in quite the same way. These include diminishing collection budgets to address the burgeoning number of electronic resources to be acquired (while at the same time witnessing increased numbers of analog materials) and services for people with disabilities and literacy. Archives with their unique multimedia collections place high emphasis on preservation of and access to all forms of documentation. Meanwhile, they must cope with the increasingly complex legal environment for the selection and preservation of official documents, legal discovery in class action litigation together with escalating freedom of information responsibilities, and the imperatives of copyright and privacy protection.

Digital

Canada's libraries and archives have been in the forefront of adapting to an increasingly digital environment. In the 1990s, Canada's federal government established an Information Highway Advisory Council that set the stage for a range of federal initiatives including digitization programs and LibraryNet and SchoolNet programs. The National Archives launched a multiyear initiative to digitize the key records of the 660,000 Canadians who served in World War I. The National Library established a pilot project in 1993–1994 to begin the acquisition of Canadian born-digital publications. Canadian publishers, particularly publishers at the federal and provincial governments, have made a major shift to producing their publications in digital formats. Canadian libraries and archives are actively engaged in digitizing parts of their collections. Some large digitization projects such as *Our Roots/Nos Racines*, which pulls together local histories and genealogical materials from across the country, were financially supported by the Department of Canadian Heritage. This same program has also supported the transfer to digital formats of important cultural resources from the National Film Board of Canada/*Office national du film du Canada*, and Canada's public broadcaster, CBC/Radio-Canada, LAC, BAnQ, and other research libraries have shifted resources to support digitization initiatives and have been active partners internationally to harvest and preserve significant websites. Canadians have been concerned about seeking to have a critical mass of Canadian digital content in order to provide a strong Canadian voice with the Canadian experience, culture, and heritage easily available on the Internet. Mass digitization on a national scale through

Canadiana.org supported by the CARL is advancing, with minimal assistance from the federal government. Libraries, archives, museums, broadcasters, publishers, and other stakeholders came together in 2006 to develop a cohesive Canadian Digital Information Strategy, which articulated a vision:

Canada's digital information assets are created, managed and preserved to ensure that a significant Canadian digital presence and record is available to present and future generations, and that Canada's position in a global digital information economy is enhanced.^[14]

Despite many efforts, this vision for a modern knowledge society and evidence-based decision-making has not been shared by the government. Libraries and archives are advancing this agenda through reallocation of their own limited resources. In June 2016, LAC announced the launch of the National Heritage Digitization Strategy, the objective of which is to reposition Canada and provide a cohesive path toward the digitization of Canadian memory institutions' collections by encouraging the long-term viability of documentary heritage records through quality standards-based efforts and ensuring a national plan of action will be in place (www.bac-lac.gc.ca/eng/about-us/Pages/national-heritage-digitization-strategy.aspx).

Public libraries and other institutions are concerned about a growing digital divide, between those Canadians who have easy access to computers and appropriate training and computer literacy skills and those who do not. Programs such as the Bill & Melinda Gates Foundation's Library Program's gifts of computer equipment, improving Internet access, and providing computer training facilities to public libraries across Canada have made a very large contribution to addressing the digital divide. Public, government, and university libraries are in the forefront in terms of offering digital services and collections.

Preservation

In terms of preservation, the CCA released a national strategy for archives in 1994, *The Preservation Strategy for Archives in Canada*. The National Archives established an expert national task force and released an alarming report in 1995 entitled *Fading Away* to raise awareness of the need to preserve the nation's audio-visual heritage in radio, television, film, and sound. In 1993, the then National Library working in collaboration with a national committee developed a national preservation strategy for libraries, *A National Strategy for Preservation in Canadian Libraries* and *Guidelines for Preservation Microfilming in Canadian Libraries* were developed and published. The mass deacidification program of LAC has treated more than a million items in their collections. LAC also moved forward on permanent paper standards adopted by the federal government, which has largely eliminated the use of inappropriate, acidic paper by Canadian print publishers. Generally, the interest and

support of preserving analog materials in paper, compact discs, tape, CD-ROMs, and other media has ebbed as digitization to ensure access has become prevalent at many custodial institutions. The LAC Preservation Centre and the new nitrate storage facility provide the best possible secure environments as do the many new library and archives buildings across the country. Several libraries have developed digital facilities meeting international standards for trusted digital repositories, but unique Canadian digital content and recordkeeping grows faster than the institutional capability. This remains a concern for institutions and the public who are coming to realize that their own digital legacy is transitory.

Access

In an environment where research is increasingly interdisciplinary and the point of access is via the Internet, researchers pay less attention to where their information needs are being met. “Access is the driver” has become a direction in many archival institutions, and while this is a natural sentiment in libraries to facilitate and support access to all collection materials, it has been less willingly embraced in many archival institutions where the training and practice has been to protect access in order to preserve materials. In Canadian libraries and other libraries, there is an increasing move to have open access for digital materials, particularly those that are publicly owned and non-exclusive licenses with private sector digitizing partners. The Simon Fraser University Library in partnership with the UBC hosts the development and provides support for the Public Knowledge Project’s open-source software for scholarly publishing and communication. CARL and its members have worked with Canada’s three federal research granting councils, first on endorsing open-access principles for the publication of scientific research (2010) and subsequently in encouraging the agencies to adopt an open-access policy on publications (2015). The intent is explicit: “The objective of this policy is to improve access to the results of Agency-funded research, and to increase the dissemination and exchange of research results” (http://www.science.gc.ca/eic/site/063.nsf/eng/h_F6765465.html). Similarly the three agencies adopted a *Statement of Principles on Digital Data Management*, requiring responsible stewardship with plans for metadata, preservation, and data sharing (http://www.science.gc.ca/eic/site/063.nsf/eng/h_83F7624E.html).

Archives and libraries are concerned about standards and best practices in digitization from analog and in creating born-digital materials to ensure long-term access. They are also concerned about integrity and authenticity of the originals and, given the Canadian context, how to see more materials online that speak to increasing multi-lingual and aboriginal audiences. To be truly useful, digital information resources have to be organized for seamless and more open access in a bilingual

environment. Access for archivists also speaks to access to information and privacy concerns with the large volumes of records of federal, provincial, and municipal governments. Equitable and ubiquitous access from wherever in the country is viewed as critical to the nation’s economic and cultural growth and innovation.

Description

The Canadian library community and, to some extent, the archives are implementing new standard for bibliographic description, *RDA: Resource Description and Access*, which is replacing the *Anglo-American Cataloging Rules 2nd Ed.* (AACR2). Description of published materials has been under review for some years by the Canadian Committee on Cataloguing, a national advisory committee and member of the Joint Steering Committee for Revision of AACR (JSC). The work of Dr. Tom Delsey, a Canadian, on the conceptual models Functional Requirements for Bibliographic Records (FRBR) and Functional Requirements and Numbering of Authority Records (FRNAR) prepared for the International Federation of Library Associations and Institutions (IFLA) have led the way for an overhaul of bibliographic description. He is also the editor of the new *Anglo-American Cataloging Rules 3rd Ed.* (AACR3), which has reassessed the fundamentals of bibliographic description. The AACR3 has been developed and is being implemented jointly by LAC, the Library of Congress, the British Library, and the National Library of Australia. Archival description in Canada is carried out under the “Rules for Archival Description (RAD)” developed and updated by the Canadian Committee on Archival Description (CCAD). The RAD was revised in October 2005 and the rule revisions took effect in 2007. In 2016, CCAD convened a meeting on The Future of RAD in Ottawa and reached a consensus regarding the future of archival descriptive standard in Canada and the possible revision or replacement of RAD (<http://archivescanada.ca/FutureOfRAD>).

Management of Government Information

The effective management of the administrative records of all levels of government, federal, provincial, territorial, and municipal, has become a major challenge across the country. Access to information and privacy protection coupled with public expectations and political commitments to accountability and transparency has provided incentive for all levels of government to improve their recordkeeping. As in the private sector, the stringent requirements for legal discovery in class action lawsuits have lent urgency. Most jurisdictions now recognize information and records as assets, which are formally the responsibility of all managers. The federal government in particular has had a number of major inquiries and auditors’ reports highlighting deficiencies in recordkeeping.

The Auditor General's Report of Fall 2014 concluded that LAC was not adequately fulfilling its responsibilities for acquiring, preserving, and providing access to government documentary heritage and had a considerable backlog of records for processing. A dedicated task force was put in place to assess and process 10 additional kilometers of archives so that they will be discoverable for users. Given the volume of government records being produced and the embrace of digital information and e-mails, government archives have been under significant pressure to put the infrastructure in place for improvements—guidelines, best practices, use of automated systems for the handling of electronic information, and more rigorous monitoring. The 2004 “Library and Archives of Canada Act” incorporated a number of new specific measures to strengthen the role of archivists in acquiring and describing Government of Canada records as well as identifying records at risk. To cope over the past two decades, the LAC pioneered risk-based functional analysis approach to the appraisal and selection of records. On a more positive note, governments have begun to make significant amounts of their published information and datasets available on the Internet to improve access by the public. The federal government is committed to the precepts of open data and in 2014 announced the formation of an Open Data Institute with the private sector.

Copyright

Canadian libraries and archives have taken a strong leadership and advocacy role as successive Canadian governments have moved to update and reform Canadian copyright legislation and to bring Canadian law into conformance with international copyright treaties. Acting collectively, library and archival groups have asserted views on the necessity of a balanced approach to copyright changes, which factors in users as a counterweight to creators. They also look to implement technology neutral approaches and technological protection measures and protection of educational use of the Internet. In 1986 Canada established the Public Lending Right Commission/*Commission du droit de prêt public*, which compensates registered authors on an annual basis for the use of their books (print format only) held in Canadian libraries. The advent of large digitization projects has put a renewed focus on securing copyright permissions and ensuring that copyright restrictions are respected. Libraries and archives in most Canadian jurisdictions operate under copying licenses from a number of copyright collectives.

In 2004, the Supreme Court of Canada clarified and expanded the scope of a “fair dealing” defense, seeking to balance the public interest with the rights of copyright holders (2004 SCC 13: *CCH Canadian Ltd vs the Law Society of Upper Canada*). The *Copyright Modernization Act* of 2012 recognized education as a permitted purpose, provided it is reasonable and fair. CARL is preparing to

participate in a Parliamentary review of the Act scheduled for 2017.

Resource Sharing

Equitable access by the public to collections held in libraries in Canada has been a public policy issue for many years. There is an assumption in Canada that the investment in building collections with public funds means that Canadians in principle should have access to these materials. This has manifested itself in many ways. The national union catalog maintained by LAC is one manifestation of this. With the creation of the National Library of Canada in the early 1950s, one of its first priorities was the microfilming of holdings of significant libraries across the country. Over the years, this has become a highly automated process but with the same purpose to permit library users in one library to have access via interlibrary loan to materials in other collections. Similarly, Archives Canada has brought access to the resources of participating Canadian archives and increased the ability of Canadians to know what had been collected and where it was available and possibly to seek access via interinstitutional loan. These national services and resources are bolstered by a series of agreements and provincial and regional union catalogs across the country. In 2017 LAC entered into an agreement with the Online Computer Library Center (OCLC), the massive international library cooperative, to move the Canadian National Union Catalogue to the OCLC database by the end of 2018. The Library Book Rate, a program of the Department of Canadian Heritage through Canada Post, subsidizes the transport of library materials from library to library. This is particularly important in rural and more remote parts of the country. A recent manifestation of this continued interest in resource sharing is the Resource Sharing Agreement agreed to by the Council of Prairie and Pacific University Libraries (COPPUL), the Ontario Council of University Libraries (OCUL), the *Conférence des recteurs et des principaux des universités du Québec* and the Council of Atlantic University Libraries/*Conseil des bibliothèques universitaires de l'Atlantique*. This permits students, faculty, and staff of Canadian universities standardized reciprocal interlibrary loan and document delivery privileges across Canada. Standards developments such as Z39.50 protocols and the Virtual Union Catalogue of Canada have all supported this sharing of resources.

National Planning and Coordination

Given the decentralized situation with respect to libraries and archives in Canada, it is important that there be planning and coordination mechanisms in place on a national level. The Canadian Digital Information Strategy, discussed earlier, was an important initiative of LAC in working nationally across different disciplines to achieve

a common purpose. Resource sharing is another area where coordination and leadership has been critical to cut across different types of libraries (public, university, college, school, special, government) and archives (government, private, university) to ensure equitable access to information holdings for Canadians. The CCA provides a mechanism for leadership and direction for Canadian archives. The Council on Access to Information for Print-Disabled Canadians was established to give advice, identify funding requirements monitor progress and make recommendations regarding the implementation of "Fulfilling the Promise: The Report of the Task Force on Access to Information for Print-Disabled Canadians." National library associations and groups provide leadership but are more fragmented and there is no coordinated program for library development. They come together to address contentious issues but are less engaged in working collaboratively in a proactive way to support critical research, develop public policy and plans on a national scale. The lack of national library and archival statistics gathering by Canada's national statistical agency, Statistics Canada, makes coordination and information gathering and policy development much more difficult.

Human Resources

Archives and libraries in Canada share major concerns about their workforces, which will be changing dramatically over the next few years. Libraries and archives witnessed great expansion in the 1970s and grew rapidly. The demographics of Canada's workforce in archives and libraries are such that there will be many leaving their professions over the next 5–10 yrs. The Cultural Human Resources Council, a federal body, has recently completed a "Training Gaps Analysis for Librarians and Library Technicians." Competencies and training for professional and non-professional staff in libraries and archives are evolving rapidly in response to the demands of a digital environment and the needs of an increasingly diverse Canadian public. The CLA's President's Council on the 8Rs (the Rs referring to recruitment, retirement, retention, rejuvenation, repatriation, reaccreditation, remuneration, and restructuring) has collaborated with CARL and the University of Alberta to analyze library staff trends over a decade from 2004 on and has informed workforce planning (the studies are available at <http://www.ls.ualberta.ca/8rs/reports.html>).

Convergence

With the dramatic growth in electronic resources, there is growing recognition that Canadian researchers and users of libraries and archives are increasingly unconcerned about whether it is archival or library materials that have been used to provide information or whether it is a library or an archives that has provided the information they require. Professional education and training at graduate

programs across the country reflect an increased emphasis on offering programs where students at the same faculty can specialize in archives or library studies or more generally for information as a discipline. Similarly, trainings at postsecondary institutions offering programs for technicians are blending both library and archival training. Joint exhibits with museums and galleries have become common, evidence of the recognition that Canadian governments are giving to an integrated approach to knowledge and our collective memory.

Working Collaboratively

In the past decade, collaboration has become the rule; not the exception. In the Canadian library world there are several approaches to collaboration. Consortia are well established with research libraries having a particularly close relationship in a number of regional consortia, the COPPUL, the OCUL, *Bureau de Coopération Interuniversitaire* (BCI) [formerly the *Conférence des recteurs et des principaux des universités du Québec* (CREPUQ)], and the Council of Atlantic University Libraries/*Conseil des bibliothèques universitaires de l'Atlantique* (CAUL/CBUA). The Partnership, which is the provincial and territorial library associations of Canada working together, offers programs and services to members of these associations. These include continuing education through the Education Institute, the Career Centre, and the electronic journal initiative, *Partnership: The Canadian Journal of Library and Information Practice and Research*. The Library Subcommittee of BCI supports cooperative collection development across the 17 French and English university libraries of Quebec, sharing cataloging resources and the development of the *Bibliothèque de recherche virtuelle québécoise* (BRVQ), the gathering of statistical data, and training and professional development. The Capital Smart Library/*la Bibliothèque de la Capitale* is a consortium of libraries, archives, and museums in the cities of Ottawa and Gatineau including the Ottawa Public Library, LAC, NRC-CISTI, and the libraries of Carleton University, the University of Ottawa, Algonquin College, and the Dominican University College as well as the Canadian Museum of History, the Canadian War Museum, and the National Gallery. All of these institutions' online catalogs have been added to the SmartLibrary Z39.50 gateway for federated searches to facilitate direct loans. Canada's archives have collaborated to establish ArchivesCanada as the search portal for access to fonds level description and increasingly to more detailed finding aids. The Toronto Public Library, the Regina Public Library, the Halifax Public Libraries, and the Vancouver Public Library have been working collaboratively on a joint project called Working Together: Library–Community Connections funded by the federal government. The project is seeking to develop better ways of serving socially excluded

communities and individuals who have not traditionally used library services. In Vancouver, the focus of the project is on the poor, in Toronto on immigrants, in Regina on indigenous peoples, and in Halifax on a socially disadvantaged community. For more than a decade, the Toronto–Dominion Bank has worked with the TPL, LAC, and, now, almost 2000 public libraries to offer the successful TD Summer Reading Club to engage school children in improving reading skills each summer.

Multilingual Services

Given the diversity of Canada's population and its multilingual and multicultural character, Canada's libraries have recognized for some years the importance of building collections and providing services that better respond to information needs.

Indigenous Services and Collections

The range of services provided to Canada's indigenous peoples and the kind of collections and information they need to access are very broad. In Nunavut, the only jurisdiction in Canada with a majority of the population being of indigenous descent, a consortium of the legislative, college, public, and court libraries has worked together on a common integrated library system to provide information in a shared Web-based public access catalog with Inuit syllabics. Many of Canada's indigenous peoples live on reserves where there are a variety of services provided. School libraries play a particularly strong role. Some First Nations' territories are in the remote parts of the country, with little access to books. In 2004, Honorable James Bartleman, then lieutenant governor of Ontario, issued a call for books. The public response was overwhelming and 850,000 quality used books were delivered to remote northern communities. This initiative has continued under his successors and is now the lieutenant governor's aboriginal literacy program (see <http://www.johnschofield.com/index.php/portfolio/lieutenant-governors-literacy-programs/>). Given the challenges provided by a strong oral tradition and insufficient numbers of published materials for and about indigenous peoples, there has been a major attempt both to stimulate publishing and to build libraries and library infrastructure in ways most relevant to First Nations peoples. Library education has been a concern, and for many years the National Library supported a program to send indigenous students to graduate library programs. Services to indigenous youth and adults living in urban settings are also a particular challenge.

Services for People with Disabilities

Roch Carrier, National Librarian of Canada from 1999 to 2004, established the Task Force on Access for Information for Print-Disabled Canadians. Their report, "Fulfilling the

Promise: the Report of the Task Force on Access to Information for Print-Disabled Canadians," made recommendations in a broad number of areas. In response to these recommendations, as well as the Federal Disability Agenda of the federal government, a number of significant achievements are being put in place including an Electronic Clearinghouse for Alternative Format Production. The pilot project for the Clearinghouse was supported by the Council on Access to Information for Print-Disabled Canadians (an advisory group to the Librarian and Archivist of Canada), the Canadian Publishers' Council, the Association of Canadian Publishers, *l'Association nationale des Éditeurs de Livres*, and leading Canadian alternative format producers with funding from Social Development Canada.

CONCLUSION

Libraries and archives in Canada have come of age in the digital era. While operating in a decentralized federation, Canada's libraries and archives and their various consortia, associations, and councils actively pursue opportunities to advance services and awareness. It is an exciting time: challenging but dynamic as technology and public expectations must be balanced with resources and capacity. New approaches thrive. The Public Service of Canada was recently encouraged to respond to this changing environment through collaboration, innovation, and courage.^[15] Librarians and archivists have been doing precisely this for some time.

APPENDIX: CHRONOLOGY

1. 1635—Collège des Jésuites organized the first university library in North America.
2. 1752—First press established in Halifax, Nova Scotia.
3. 1779—First bilingual subscription library established in Quebec City.
4. 1790—Ordinance "For the Better Preservation and Due Distribution of the Ancient French Records."
5. 1832—"Act for the Protection of Copyright" required deposit of printed books, charts, maps, and prints to secure copyright.
6. 1851—First Public Libraries and Mechanics' Institute Act passed by the Government of the United Canadas.
7. 1857—Appointment of Thomas B. Akins as Nova Scotia's Commissioner of Public Records.
8. 1867—Creation of the Canadian federation with the "British North America Act."
9. 1872—Appointment of Douglas Brymner and founding of the national archives.
10. 1876—Opening of the Library of Parliament building, Ottawa.
11. 1901—Ontario Library Association organized.

12. 1912—National archives detached from the federal Department of Agriculture and recognized by statute.
13. 1920—Provincial Archives of Quebec established and “Public Libraries Act” in Ontario revised.
14. 1923—“Canadian Catalogue of Books” started.
15. 1933—Carnegie Corporation supports a national study of library conditions and needs.
16. 1941—Rockefeller Foundation examines Canadian libraries.
17. 1943—Canadian Library Council incorporated.
18. 1946—Canadian Library Association formed.
19. 1948—W. Kaye Lamb appointed Dominion Archivist and given responsibility for preparing the way for a national library.
20. 1950—Canadian Bibliographic Centre established to compile a national catalog of the holdings of Canadian libraries and to publish bibliographies of current and retrospective Canadian publications.
21. 1951—Report of the Royal commission on National Development in the Arts, Letters, and Sciences 1949–1951 has a number of recommendations with respect to the archives and libraries.
22. 1952—“National Library Act” passed.
23. 1967—Opening of Public Archives National Library building in Ottawa.
24. 1967—Passage of “Bibliothèque nationale du Québec Act.”
25. 1975—Publication of *To Know Ourselves: the Report of the Commission on Canadian Studies*.
26. 1980—“Canadian Archives”—Report to the Social Sciences and Humanities Research Council of Canada.
27. 1985—Creation of the Canadian Council of Archives.
28. 1986—Creation of Public Lending Right Commission.
29. 1987—“National Archives of Canada Act.”
30. 2004—“Library and Archives of Canada Act” proclaimed merging the National Archives and National Library of Canada.
31. 2006—Establishment of the Bibliothèque et Archives nationales du Québec (BAnQ).
32. 2015—Final Report of the Truth and Reconciliation Commission of Canada: Honouring the truth, reconciling for the future.

Canadian Heritage Information Network (CHIN)

Shannon Ross

Paul M. Lima

Canadian Heritage Information Network (CHIN), Gatineau, Quebec, Canada

Abstract

A national center of museum excellence, the Canadian Heritage Information Network (CHIN) enables Canada's museums to engage audiences through the use of innovative technologies.

The Canadian Heritage Information Network (CHIN) supports an active network of more than 1350 not-for-profit member heritage institutions of all sizes and disciplines. Since 1972, this special operating agency of the Department of Canadian Heritage has been connecting museums with Canadians, enabling the creation, management, presentation, and preservation of digital heritage content for current and future generations.

To achieve this, CHIN pursues three strategies: mobilize and support collaborative networks of heritage institutions and research partners; provide skills development resources for heritage professionals; and support the development and presentation of digital heritage content.

Through its programs and online services, CHIN makes it possible for heritage professionals and volunteers to:

- interact and learn with colleagues through <http://www.pro.chin.gc.ca>;
- explore and share collection records through a growing online national inventory titled *Artefacts Canada*;
- reach and captivate their audiences, including youth, through virtualmuseum.ca—Canada's virtual national museum and the Department of Canadian Heritage's most popular online destination;
- engage teachers and students through the collaborative development of interactive online spaces and accompanying digital learning resources.

OVERVIEW

With the rapid development of new technologies, the heritage community is being presented with new and important opportunities. The Internet, more than just another medium, is a new environment in which heritage institutions have an active role to play. In order to adapt to and lead by example in this new domain, they must develop the necessary skills and abilities while making themselves relevant and meaningful to the world's online audiences.

In this regard, CHIN, in close collaboration with its members, is increasing the creation of Canadian online

content displaying the diversity of our heritage. As of today, more than 1350 Canadian heritage organizations are actively engaged in the network.

Through its professional Web site and related activities, CHIN helps to strengthen the knowledge and abilities of the Canadian heritage community with respect to the creation, presentation, management, and preservation of digital content. The CHIN site provides heritage professionals with easy access to extensive resources that draw from CHIN's own work and research as well as other centers of expertise around the world.

These online resources include:

- A national inventory of more than 3.5 million museum objects, including cultural and historical artifacts and natural science specimens.
- A forum in which heritage professionals and volunteers can learn, exchange knowledge and ideas, and collaborate.
- Bibliographies and data dictionaries.
- Research and reference tools.
- Publications on intellectual property, digital content, collections management, and standards.
- Courses on image digitization and automated collections management systems.
- Information on professional events and career opportunities.

In addition to its online services, CHIN works nationally and internationally, offering workshops, convening meetings on subjects of common interest to its membership, as well as sponsoring and attending conferences and events that provide opportunities for heritage professionals to increase their expertise. Underlying all of CHIN's activities is a continued, collaborative research program designed to advance our collective understanding of issues associated with new technologies and digital content, particularly in the areas of intellectual property and online audiences.

CHIN also represents the Canadian heritage community internationally in projects that facilitate access to

heritage information, and has been recognized for its work in developing standards for museum documentation. This work encompasses a broad range of information types and the technical protocols necessary for the exchange of information in a widely distributed environment.

CHIN's internationally recognized and most commonly accessed initiative, the Virtual Museum of Canada (VMC), showcases Canadian museums and their collections to a worldwide public audience. Through online exhibits, free games, and images, the VMC integrates art, culture, and heritage from Canadian museums. Designed in part to support classroom learning, it includes interactive lesson plans and learning resources for teachers and students. At the same time, anyone can access the site to learn about and explore the treasures of Canada's museums or browse listings of museums, events, and live exhibits across Canada.

CHIN also manages the international Bibliographic Database of the Conservation Information Network (BCIN), the Web's most complete bibliographic resource for the conservation, preservation, and restoration of cultural property. While previously part of CHIN's subscription-based research and reference resources, BCIN is now offered free-of-charge.

BACKGROUND

The 1970s: Founding of the National Inventory Programme

CHIN began as the National Inventory Programme (NIP) in 1972. It was created in response to the 1970 UNESCO Convention on Means of Prohibiting and Preventing the Illicit Import, Export, and Transfer of Ownership of Cultural Property, of which Canada was an early signatory. The 1972 National Museums Policy proposed the creation of an inventory of the cultural and scientific collections held by public institutions in Canada. The mandate of NIP was to create a computerized national inventory of Canadian cultural and scientific collections, to facilitate the sharing of collections information, to conduct applied research and development on information management standards and technology, and to advise museums and the heritage community in these areas.^[1] Later policies extended the mandate to include other online resources.

The establishment of the National Inventory Programme resulted in the compilation of Canadian heritage information in three National Inventories—databases of humanities and natural science collections, as well as archeological sites. At first, museums sent their paper collections catalogs to CHIN for automation, but as technology advanced the National Inventories were maintained by the participating museums through dial-up access to CHIN's mainframe computer, with support from CHIN.

The National Inventories became an important resource, used for research, comparative cataloging, and exhibition planning, but also as a tool for individual institutions to manage their collections. CHIN also provided museums with the capability to share information through electronic mail long before the Internet made this a common practice.

In support of these activities, CHIN became active in the development and implementation of documentation standards, promoting the consistent documentation of museum information at the institutional and national level, and contributing to the development of international standards initiatives (Fig. 1).

The 1980s: Expansion of Services

In 1987, CHIN added the Conservation Information Network (CIN) and a series of other reference databases to its list of resources. CHIN's resources were offered by dial-up access, free of charge to Canadian heritage institutions, and as a subscription service to others. Beginning in the late 1980s, CHIN began to work with the Canadian heritage community to assess emerging technologies for disseminating museum information. Several projects involving CD-ROM and CD-I production were completed, providing valuable experience to all participants.

The 1990s: A New Mission

In 1995, CHIN engaged in a major review of its programs, in consultation with its client community. With the improvements in desktop technology and the advent of the Internet, CHIN and Canadian museums visualized an environment where museums would create rich public information resources which would be available electronically. CHIN developed a new mission to promote the development, presentation, and preservation of Canada's digital heritage content for current and future generations of Canadians.^[2]

In October 1995, all of CHIN's products and services, previously available only by dial-up access to CHIN contributors and subscribers, were launched on the Web. CHIN, working with the Canadian heritage community, also developed new collaborative products. CHIN's first virtual exhibition, "Christmas Traditions in France and Canada," released in 1995, served to bring museum content to new audiences while increasing the participants' experience in providing content for the Web.

Another new product that took advantage of the Internet to promote museums and reach new audiences was the Guide to Canadian Museums and Galleries. The Guide enabled museums to maintain their own institutional information in a searchable Internet directory—this was especially important for small museums that would not otherwise have had a presence on the Internet. CHIN also provided Internet accounts and training to museums as a

Fig. 1 A timeline of CHIN's most significant initiatives between 1972 and 2007.

means to participate in the Internet initiatives that were available, and to take advantage of the growing pool of resources for museums on the Web.

Also in 1995, as personal computers became more powerful and commercial collections management software became widely available, CHIN began assisting museums with the transition of their collections data from the CHIN mainframe to in-house collections management systems. This assistance included an assessment of a wide range of available software packages, conducted by CHIN and a team of museum professionals. The transition to in-house collections management software was accomplished by spring of 1998.

CHIN continued its participation in the development, promotion, and implementation of information standards, within the Canadian museums community and internationally. CHIN's participation in the Consortium for the

Computer Interchange of Museum Information (CIMI) and the International Committee for Documentation (CIDOC) of the International Council of Museums enabled the international community to benefit from the expertise of Canadian museums while yielding important results that could be applied to the interchange and management of museum information in Canada.

As museum information became more accessible on the Internet, CHIN began producing publications to address issues of copyright and protection of museum data and images on the Web. CHIN also began to provide information to museums on image digitization and collections management through a series of publications, online resources, and workshops.

In 1996, CHIN developed the Heritage Forum, a searchable online journal for heritage professionals with content contributed online by CHIN and users alike.

In 1999, the National Inventories were redesigned for the Web and renamed Artefacts Canada. Canadian museums contribute collections data and images to Artefacts Canada over the Web, and it has become a valuable professional resource.

The 2000s: Enriching the Virtual Experience

In 2004, following feedback from the Canadian heritage community, the Archaeological Sites section of Artefacts Canada was removed. Learning With Museums, launched in 2000, was developed by CHIN with the goal of enabling museums to promote their online educational materials to teachers and students.

In 2001, CHIN launched the VMC. CHIN works with the museum community in a collaborative effort to enable the creation, management, and presentation of digital content.

CHIN maintains two Web portals: the CHIN Web site at <http://www.chin.gc.ca>, which provides professional resources to the heritage community and the VMC at virtualmuseum.ca, which showcases Canadian museums and their collections to a worldwide public audience. CHIN also administers the Virtual Museum of Canada Investment Programs, which support museums in the creation of digital content for the VMC.

The museum information from the Guide was repurposed in the Find a Museum and Calendar of Events sections of the VMC. The rich resource that began as the National Inventories, which represents the results of nearly 40 years of collaboration between CHIN and the museum community, was also incorporated into the VMC—the Artefacts Canada collections records with images became part of the Virtual Museum of Canada Image Gallery. Learning With Museums was made part of the Virtual Museum of Canada Teachers' Centre.

Since the debut of the VMC, people from around the world have embraced this gateway to the exciting multimedia content created by Canadian museums. In its inaugural year, the VMC attracted almost 3 million visitors from more than 140 countries.

To coincide with the launch of the public-oriented VMC site in 2001, the focus of the CHIN Web site shifted to become exclusively a resource for heritage professionals. Artefacts Canada and the Heritage Forum remained on the CHIN site as professional resources, in addition to the publications, courses, and reference databases that CHIN offers.

PROGRAMS AND ACTIVITIES

Artefacts Canada

A growing national inventory, Artefacts Canada (also at <http://www.chin.gc.ca>) provides access to more than

3.5 million collection records from hundreds of museums, as well as more than 600,000 accompanying images. All images accompanying records are also accessible through the Virtual Museum of Canada's Image Gallery. The ongoing contributions of Canadian heritage institutions strengthen Artefacts Canada's value as a research and reference resource for the museum community, while increasing each participating museum's online profile through the VMC.

CHIN Web Site and the Knowledge Exchange

By providing heritage professionals with the means to share their collections and expertise, CHIN helps Canadian museums establish themselves as world leaders in the effective use of information and communication technologies.

CHIN members also access comprehensive products and services that address all aspects of the digital content process. Through its professional Web site and related activities, CHIN helps strengthen the knowledge and abilities of the Canadian heritage community with respect to the creation, presentation, management, and preservation of digital content. Welcoming nearly 4 million visits each year, the CHIN site at <http://www.chin.gc.ca> provides easy access to extensive resources that draw from CHIN's own work and research as well as other centres of expertise around the world.

In May 2006, CHIN launched the Knowledge Exchange, a new section of the CHIN Web site that fuels creativity, communication, and collaboration among heritage professionals by providing self-paced e-learning products, peer-to-peer online communities of practice, and engaging presentations by experts. On subjects ranging from collections management to intellectual property and other topics, the Knowledge Exchange provides museums with a wealth of knowledge on how they can better serve Canadians through emerging technologies. In 2009, the Knowledge Exchange section was expanded to include the entirety of CHIN's professional development resources. Rebranded as the Professional Exchange, the website can be freely accessed at <http://www.pro.chin.gc.ca>.

The VMC

For CHIN and its member institutions, the VMC is by far one of the network's proudest accomplishments. Administered by CHIN, Canada's national online museum brings a rich collection of engaging high-quality online content into Canada's homes, schools, and workplaces.

Through the VMC's digital content, heritage institutions can present their collections to a much wider audience than ever before, while showcasing their innovative use of digital technologies to the world. The Virtual Museum of Canada currently features over 500 online

exhibits that bring to life Canada's treasures and stories; nearly 600,000 images of museum objects; more than 140 interactive games for children of all ages; and detailed listings for nearly 3000 Canadian heritage institutions.

In 2007, the VMC began enabling museums to further engage Canada's educators and learners in active learning through a new pilot project entitled the Agora Research Initiative. Responding to the growing use of the Internet by educators and students, the VMC is adding innovative tools and content (in the form of texts, audio and video files, and animations) that enable teachers to create their own lesson plans and projects, interact with students online, and provide interactive learning experiences.

Virtual Museum of Canada Investment Program: Virtual Exhibits Component

CHIN supports the development of multimedia online exhibits, games, and learning resources to be showcased on the VMC. Under a competitive process, heritage organizations submit proposals to the Virtual Museum of Canada Investment Program to produce bilingual virtual exhibits, interactive games, and educational tools that engage diverse audiences through quality research and appealing presentation.

Proposals are reviewed by an Editorial Board composed of representatives from the museum community, as well as other sectors such as the publishing, education, library, and new media.

Virtual Museum of Canada Investment Program: Community Memories Component

The Community Memories Program helps smaller museums to engage and involve their communities in the sharing of their local history through simple technology. The range of possible subjects for a Community Memories exhibit is endless. Examples include a town's main industry, a historical event, traditional crafts, or a way of life. These productions allow communities to rediscover the people and events that shaped their past and present, bringing otherwise dispersed records into a coherent, engaging narrative. As well, these online exhibits provide Canadians from coast to coast with insight into the values and experiences that have shaped the country's collective identity. Museums with successful proposals are supplied with user-friendly software, and museums with five or fewer full-time employees also receive a standard investment.

Research

CHIN conducts research into how museums can best approach issues such as information management, digital technologies, intellectual property, and standards. It draws on this knowledge to provide research and reference

resources, as well as training opportunities for heritage professionals and volunteers, online and in-person.

CHIN is committed to staying on the leading edge of digital heritage research and technology that enhances public engagement and participation. Accordingly, it mobilizes and supports collaborative networks of heritage institutions and research partners, which leads to the publishing of original research. CHIN also works to improve heritage information management, maximize benefits for knowledge creators and distributors, and increase the ability of museums to capitalize on new business opportunities.

International Activities

CHIN works nationally and internationally, offering workshops, convening meetings on subjects of common interest to its membership, as well as sponsoring and attending conferences and events that provide opportunities for heritage professionals to increase their expertise. Underlying all of CHIN's activities is a continued, collaborative research program designed to advance our collective understanding of issues associated with new technologies and digital content, particularly in the areas of intellectual property and online audiences.

CHIN also represents the Canadian heritage community internationally in projects related to access to heritage information, and has been recognized for its work in developing standards for museum documentation. This work encompasses a broad range of information types and the technical protocols necessary for the exchange of information in a widely distributed environment.

Amongst other international initiatives, in recent years CHIN has taken a leading role in the digital Cultural Content Forum (dCCF), a partnership that brings together government agencies around the world that are dedicated to enabling heritage institutions in the fields of information and communications technologies.

MEMBERSHIP

CHIN and Canadian heritage institutions work together to strengthen our collective ability to create, present, and manage Canadian online content. This collaboration has resulted in the internationally valued Web site for heritage professionals at <http://www.pro.chin.gc.ca>, www.chin.gc.ca, and the highly successful VMC portal at virtualmuseum.ca.

Public, not-for-profit, Canadian museums and other heritage organizations are eligible to reap the many benefits of CHIN membership, including participation in the VMC. Membership is available at no cost to eligible institutions. Membership benefits include, but are not limited to:

- Extensive marketing support to heighten the collective profile of member institutions in schools and among

the domestic and international Web surfing public (e.g., billboard campaigns, press relations, online marketing, contests, search engine optimization).

- Access to CHIN's multifaceted expertise and ongoing technical support.
- Ability to have an important voice in shaping CHIN initiatives, and to participate in the development of programs.
- Presence on the VMC.

CONCLUSION

For over 35 years, CHIN has been an international leader in the enabling of heritage institutions to engage audiences through the use of innovative technologies. CHIN has a strong and privileged relationship with hundreds of heritage institutions and organizations across Canada, and around the world; and it actively nurtures its partnerships in an effort to leverage resources and expertise for the benefit of the Canadian and international heritage community.

CHIN will continue to work closely with the heritage community in the coming years to further enhance and enrich online communication, collaboration, creativity, and access to heritage information. As emergent technologies take hold of public use and interest, CHIN will continue to assist museums and heritage institutions in finding ways to take part in these new phenomena. For instance,

the growing use of iPods and other MP3 players as educational tools enables museums to reach both wider audiences and target demographic groups. We are presently offering presentations from technical experts, as well as step-by-step instructions for transforming heritage content into effective podcasts.

CHIN is also continuing to facilitate knowledge transfer among information and heritage experts. As our members take part in new digitization projects and the development of digitization standards for museums, CHIN will continue to support the transfer of this insight to all members so that their institutions can benefit from broader knowledge.

Finally, CHIN continues to support a cultural environment where museums can create rich public heritage experiences which integrate the virtual world with real-life exhibits and experiences. The organization's longstanding mission to promote the development, presentation, and preservation of Canada's digital heritage content for current and future generations of Canadians will remain a top priority.

Canadian Library Association (CLA)

Donald I. Butcher

Canadian Library Association, Ottawa, Ontario, Canada

Abstract

The Canadian Library Association/*association canadienne des bibliothèques* is a national, not-for-profit voluntary organization composed of librarians, information professionals, libraries, and information services. It is Canada's largest broad-based national organization focusing on and serving the Canadian library and information community through advocacy, continuing professional development, and the provision of direct products and services.

INTRODUCTION

The Canadian Library Association/*association canadienne des bibliothèques* (CLA) is a national, not-for-profit voluntary organization composed of librarians, information professionals, libraries, information services and suppliers to the library and information sector. It is Canada's largest broad-based national organization focusing on and serving the Canadian library and information (LIS) community. The Canadian Library Association was established in Hamilton, Ontario, Canada in 1946, and was incorporated in 1947.

Canadian Library Association's mission is to be the national voice of the LIS community and to build a stronger LIS community by providing services to its members. The Canadian Library Association provides a mix of tangible services such as continuing professional development, and intangible services such as building the Canadian LIS community by facilitating networking among members. While predominately English-language, CLA provides some services in French.

To assist in providing these services, the association has created five divisions based on type-of-library or role within the LIS community; 24 interest groups based on areas of practice; and numerous and ever-changing committees and task forces to undertake specific work. The five divisions are the Canadian Association of College and University Libraries, including the Canadian Technical and College Libraries section; the Canadian Association of Public Libraries, including the Canadian Association of Children's Librarians section; the Canadian Association of Special Libraries and Information Services, with chapters in Calgary, Edmonton, Manitoba, Ottawa, Toronto, and Atlantic Canada; the Canadian Library Trustees Association; and the Canadian Association for School Libraries.

ROLES AND ACTIVITIES

The Canadian Library Association has developed into a sectoral association, with activities combining the classic

roles of professional and trade associations. The strategic plan adopted in 2004 focused on advocacy and government relations, and continuing professional development, while maintaining direct member services and building a sense of community among practitioners. A new strategic plan is to be released in 2008.

As the major national association, CLA liaises extensively with other national library associations, including the *Association pour l'avancement des sciences et des techniques de la documentation* (ASTED), the Canadian Association of Research Libraries, and the Canadian Urban Libraries Council; other associations in related heritage fields such as the Canadian Museums Association and the Canadian Council of Archives; and with other national and international associations such as the American Library Association (ALA), the United Kingdom's Chartered Institute of Library and Information Professionals (CILIP), and the International Federation of Library Associations and Institutions.

As the main national voice of the Canadian LIS community, CLA advocates for and defends the core values of librarianship such as, for example access to information or freedom of expression. The Canadian Library Association advocates on policy issues that impact library users, including federal legislation on intellectual property rights, right to privacy, and other public policy debates.

The Canadian Library Association also advocates on behalf of libraries and librarianship themselves, particularly on federal programs that directly or indirectly provide funding for library services. Examples of this are the Government of Canada's Community Access Program and Canada Post's Library Book Rate.

In its role as a provider of continuing professional development, CLA holds Canada's largest national library conference, which is moved around the country to facilitate access by those with limited professional development funding. Not wishing to duplicate the conferences of Canada's provincial and regional library associations, CLA's conference is a high-level, "pinnacle" conference targeted at the leaders and senior management in the

Canadian LIS community. Also to advance the profession, CLA publishes a bimonthly magazine that provides in-depth exploration of topics in librarianship.

The Canadian Library Association has taken a leading role in fostering and disseminating research into human resources in LIS services, both by supporting a research project led by the University of Alberta's 8Rs Research Team, and by gaining funding from the Cultural Human Resources Council (a federally supported agency) for an analysis of the gaps between the sector's human resources needs and the training available. This work follows up on an earlier CHRC-funded study of human resources in the heritage community proposed by CLA, ASTED, the Canadian Museums Association, and the Canadian Council of Archives.

To help build the LIS community, CLA provides scholarships to attend library school, grants for research and education in library and information science, awards for excellence in literature for children and young adults, and awards for professional excellence and innovation in the field of library and information science.

The Canadian Library Association also provides direct services to libraries. Since 1996, CLA has administered funding under Young Canada Works in Heritage Institutions (part of the Government of Canada's Youth Employment Strategy) for summer student employment in libraries. Since 2005, CLA has hosted and administered the database of libraries eligible to access Canada Post's Library Book Rate, a set of reduced postal rates for interlibrary loan.

Along with the ALA and the CILIP, CLA copublishes the *Anglo-American Cataloguing Rules*; CLA is a member of the Committee of Principals, established in 1989 to oversee the development of the code. A new online version of the code called *RDA: Resource Description and Access* is under development for release in early 2009. Since 1993, CLA has been the exclusive Canadian distributor of all ALA Editions titles (selected titles were handled prior to that date); and CLA publishes or distributes other works.

GOVERNANCE

The Canadian Library Association is governed by a 12-person Executive Council, with six directly elected members, five division presidents sitting as voting members *ex officio*, and the Executive Director/Secretary serving as a nonvoting member *ex officio*. Each of the five divisions has its own executive boards.

EARLY HISTORY

The pre-establishment history of CLA and an account of the first 25 years could take an entry on its own. Readers

may wish to consult *The Morton Years: The Canadian Library Association, 1946–1971* by Elizabeth Hulse.^[1] and several articles by Basil Stuart-Stubbs published in *Feliciter* and on the CLA Web site.^[2–9] The program of activities developed in 1946 included assuming the duties of the Canadian Library Council, established in 1941. The council had an executive office in Ottawa, published the *Canadian Library Bulletin* and other publications, presented briefs to the government, began microfilming Canadian newspapers of historic importance, and coordinated a library clearinghouse.

In addition to these activities, the priorities outlined in 1946 for the CLA/*Association canadienne des bibliothèques* (the name was changed in 1969 to Canadian Library Association, but the original name was brought back in 2006) included the establishment of a national library for Canada and continuing the microfilming program.

As well, CLA established an indexing service for Canadian periodicals and documentary films (*Canadian Periodical Index*, subsequently sold), supported the publication of Canadian reference materials, developed a recommended salary scale for librarians, and created standards for libraries. A triumph of advocacy, the National Library of Canada was established by an Act of Parliament in 1953. *Feliciter*, the association's newsletter, began publication in 1956 and, following the cessation of the *Canadian Library Journal* in 1992, serves as the membership magazine. The driving force behind the successes of the first 22 years, Elizabeth Homer Morton, retired as executive secretary of CLA in 1968.

The 1970s–2000

A new constitution, adopted in 1973, provided a decisive role for representatives of the provincial library associations as full voting members of the CLA Council. Also in 1973, CLA formed five divisions to provide services on a type-of-library (academic, public, school, and special) or role (trustees) basis.

In 1989, following the CLA President's Commission on Organization (known as CLAPCO; 1987), CLA reorganized its governance. The bicameral structure (consisting of board and council) was replaced by a unicameral executive council. The position of second vice-president was eliminated, as were the provincial representatives, and the number of councillors was reduced from six to three. In 1991, the position of ASTED liaison (the chair of the CLA/ASTED Liaison Committee) was removed from the executive council and the committee disbanded.

Professional development, advocacy, library leadership, membership development, and fiscal development were the strategic priorities throughout the early 1990s. The major issues were nationwide reductions in funding to tax-supported libraries and the concomitant addition of electronic materials and revisions to the Copyright Act.

The Public Lending Right Commission, consisting of authors, librarians, and publishers, was established by the federal government in 1986 to administer a program of payments to Canadian authors for their eligible books cataloged in libraries across Canada. The Canadian Library Association is represented on the Commission.

Working with the federal government and ASTED, CLA organized the National Summit on Information Policy, in 1992, to allow Canada to maximize the benefits stemming from information resources, and, in 1995, CLA launched Library Advocacy Now! (LAN!) to train advocates and champions among the library community. In 2000, the CLA/LAN! Training Institute was established.

When Canada's Copyright Act was amended in 1988, amendments favorable to creators, specifically enabling the establishment of copyright collectives, were included. A "Phase II" set of amendments to address the concerns of users was promised immediately, but these amendments were not, in fact, introduced until 1996. Successful lobbying by the creator community resulted in reductions in the already limited library exceptions being passed in the current Copyright Act in 1997. The exceptions for libraries, archives, and museums went into effect in 1999 when the accompanying regulations were published.

The amendments to the Copyright Act passed in 1997 also established rules limiting "buying around" by libraries—importing a book from a distributor outside Canada when it is available in Canada through an exclusive distributor. The regulations governing book importation were also published in 1999.

OLAM (which originally stood for Online Account Management Service), purchased in 1987 to provide discounts to members on online database services, went into bankruptcy in 1999 and was dissolved in 2000.

Working with publishers, booksellers, and writers, CLA played a lead role in the Canadian Book Summit, held in 1999 to celebrate Canada's most successful cultural product: books.

As part of its work on copyright and in support of the continued public funding of libraries, CLA has had a watching brief on international trade initiatives: in 1998, on the Multilateral Agreement on Investment, and, since 1999, on the World Trade Organization and the World Intellectual Property Organization.

From 2000 On

The Canadian Library Association's advocacy work with the Canadian government has been impacted by government instability in the first years of the new century, with multiple federal elections and Ministerial shuffles since 2000.

In advocacy, work on "Phase III" amendments to the *Copyright Act*, which deal with copyright in a digital environment, continues. The CLA is a member of the Copyright Forum—14 national library, education,

academic, museum, and archive associations representing users' concerns.

With the financial support of a number of international partners, CLA took the lead to sponsor two analyses of the impact of international trade treaties on libraries.^[10,11]

Advocacy continues on both national policy issues such as intellectual property rights and right to privacy, and on funding for libraries and information services.

A joint conference with the American Library in Toronto in June 2003 was greatly impacted by incidents of Severe Acute Respiratory Syndrome (SARS) in the city. Using librarianship's core values of access to information and rational decision-making, CLA urged ALA not to relocate the conference. The American Library Association made the courageous decision to stay in Toronto, and no delegates were impacted by SARS.

The Canadian Library Association organized the second National Summit on Libraries and Literacy in 2006, to review progress since the first Summit in 1995, and to develop plans for future collaboration between libraries and adult literacy organizations.

To build the LIS community, CLA Presidents, and Executive Directors visit the universities and community colleges that teach library and information science or library technical studies, meeting the students and informing them of the role that CLA plays in the community and in their future working lives.

CURRENT TRENDS

The Canadian Library Association continues to be the national voice for the LIS community. It advances the profession through continuing professional development and the support of research; and builds community spirit through its divisions and interest groups.

The expected retirement of the "baby boom" generation of librarians within the next 10 years has put library human resources and succession planning at the top of the issues list for most libraries. The Canadian Library Association is leading efforts to publicize and operationalize the results of *The Future of Human Resources in Canadian Libraries*,^[12] which provides the Canadian LIS community with the data needed to create new approaches to human resource management.

A crisis in school librarianship continues, with teacher-librarians being reassigned to classrooms and a resulting loss of service in school libraries.

Like most other North American associations, a large number of CLA members joined between the late 1960s and the mid-1970s, and many of them will be retiring in the next 5–10 years. As well, many of this "baby boomer" cohort are in senior management positions and either do not have the time or have already served in senior positions within the association. The nature of volunteering has changed, and one of CLAs biggest challenges is to

adapt itself to the behaviors of potential new members so that they replace those retiring, and to encourage these new members to play an active role in CLA.

The implementation of leading-edge membership database, Web site content management software, and the collaborative tools of blogs and wikis form the operational strategy as CLA strives to serve the LIS community.

The Canadian Library Association/*Association canadienne des bibliothèques* can be reached at 328 Frank Street, Ottawa, ON K2P 0X8 Canada, or via its Web site: <http://www.cla.ca/>.

Careers and Education in Archives and Records Management

Karen Anderson

Archives and Information Science, Mid Sweden University, ITM, Härnösand, Sweden

Abstract

Educators and trainers in the field of archives and records management face the challenge of providing for practitioners with widely varying educational backgrounds. At the same time, the professional environment has changed rapidly in recent years as well. Development of research programs is also crucial to the advancement of the profession and the survival of university-based professional education in the discipline. Competency standards for records management are discussed, including their appropriate role in training and education for practitioners. Examples of education and training programs from around the world are mentioned, although the coverage in this entry is not intended to be exhaustive. The role of professional associations as providers of training and in supporting and evaluating professional education programs is also addressed. The International Council on Archives Section for Archival Educators and Trainers provides a community of practice for educators and trainers. Its objectives and recent activities are described.

A wide and growing range of career choices is available to archivists and records managers. Traditional employers are national and regional archives, but there are many opportunities for specializing in aspects of the profession and the types of organizations served by the archives. Professionals with the necessary expertise required to manage digital services are in demand. Initiatives to support people of indigenous origin joining the profession and encouragement for the development of community archives are an area of growing interest.

INTRODUCTION

Education for the archives and records management profession is in tension between the need to provide an entry level qualification for new professionals and the need for generating a professional culture that is capable of finding a way forward through research while at the same time providing appropriately qualified educators for the next generation. Many countries do not have university-based programs and are reliant on short training programs for professional development, or sending prospective members of their profession overseas to gain qualifications or to further their education. At the same time, the profession must educate for a changing technological environment to ensure that sound strategies are developed for capturing, managing, and preserving born digital records. In a special issue of *Archival Science* dedicated to graduate archival education, Karsten Uhde noted: “never before in the history of archival systems has the daily work, the work material, and the whole job profile of the profession changed so quickly and radically as during the last 10–15 years.”^[1] Therefore, one of the current dominating interests in the profession is defining what knowledge and skills the recordkeeping professional needs, of which one manifestation is a drive to identify and document competencies for professional practice. Jeannette Bastian stated the dilemma of designing programs and developing curricula for a profession that must continue to preserve and

manage the record of the past while developing strategies to capture, manage, and preserve records created in rapidly changing and evolving new technologies:

Finding a balance between traditional archival subjects such as palaeography and new developments such as information management, insuring that students are prepared for an electronic information environment and promoting archival education as a professional discipline are all matters that deeply engage and also worry educators.^[2]

Tom Nesmith also explores the issues in designing curricula for a changing archival environment,^[3] while in the same issue Margaret Proctor cautions against a too-close alignment of curriculum with the shifting requirements of public policy and affirms the U.K. postgraduate programs’ strategy of

centr[ing] the educative process around the core elements of the profession—selection, preservation and provision of access; the many methods developed and developing for ensuring the effective performance of these functions; and, most importantly of all, the rationale for these functions, including the consequences for society if any aspect of them is neglected.^[4]

Nevertheless, archivists and records managers must have expertise in legislation pertaining to data protection and freedom of information legislation and the ethical issues

that arise when weighing freedom of access against protection of privacy.

While it is essential for a profession to know what it does, it must be able to validate that practice with a body of theory that is tested, confirmed, and extended through research. The tension between education for professional practice and research is an issue that preoccupies educators, most of whom constitute a small discipline interest hosted within larger university programs such as library and information science, computer science, or history. Nevertheless survival of programs within universities depends on the development of research programs that attract doctoral candidates and bring research grants to the university in order to provide the research expertise that will provide the necessary creative and investigative skills that will carry the profession forward. Furthermore, a doctoral degree is now the minimum requirement for appointment to a teaching post in professional education programs in universities. These programs must produce the next generation of professional educators.^[5] This is not a new concern: Ann Pederson^[6] pointed out the need to encourage archival research programs in universities in 1992, noting that among the barriers were low numbers of teaching programs and full-time professors in archival science; and Carol Couture reiterated the issue in 1996.^[7] In the same issue of *Archivaria*, Barbara Craig^[8] reviews Sir Hilary Jenkinson's thoughts on the need for focused archival education programs in his address at the inauguration of the first post-graduate course in England in 1947, noting that while his curriculum proposals are still relevant, education for research must be added to the archival education curriculum. In 2001, Carol Couture reported in *Archival Science*^[9] on a three-year research program investigating education and research in archival science, commencing with an extensive literature review, which was followed by a questionnaire sent out to educational institutions, national archives, and researchers. Responses from more than 70 different countries were received. By 2004 Sue McKemmish and Anne Gilliland were able to say

The past 15 years have seen unprecedented growth in the development of an archival research consciousness in the academy and in practice, as well as in scholarly awareness that the construct of *the archive*, and *recordkeeping* more generally, provides a rich locus for research and theorising. What has resulted is an unparalleled diversity of what is being studied and how.^[10]

Nevertheless, Richard Cox succinctly summarizes the enormous task facing relatively small archival education programs when he says:

it is difficult to imagine building doctoral programs, mentoring doctoral students, and guiding dissertation research if graduate educators have their time consumed

by teaching masters students, running workshops and supporting distance education.^[11]

EDUCATION AND TRAINING

University programs for archives and records management are found associated with several different disciplines. Traditionally, courses have been associated with either history or library and information science programs, but it is no longer unusual to find them associated with computer science and information systems programs, reflecting the profession's need for skills and knowledge to manage and preserve records that are born digital and to provide appropriate Internet services and access for users. In the United States and Canada, although courses are taught at master level, there are only a few entire programs dedicated to archival science. Most are courses offered within library science or history programs, or taught as optional courses. University level courses devoted to records management are relatively rare in North America. Jeannette Bastian and Elizabeth Yakel^[12] provide a description, based on comprehensive research, of both the availability of courses in archival science in the United States and Canada and what is being taught as "core" curriculum content for introductory archival courses. Two European institutions are dedicated entirely to the professional education of archivists for their respective national public service: The École Nationale des Chartes in Paris, France and the Archivschule in Marburg, Germany. In the United Kingdom archival education is positioned at master level, but all are full master programs dedicated to archives and/or records management, and applicants for the programs must complete a full year's appropriate work experience prior to commencement of their studies. Most European countries that have university-based archival education seat their programs at master level, but in Sweden and the Netherlands programs at both bachelor and master level are found, as is the case in China. Records management is included in the archival education programs taught in Scandinavia and the Netherlands. In Finland, the National Archives is a provider of education programs resulting in formal degrees, alongside university providers of archives and records management programs.^[13]

In South America university-based archival education programs are available in Argentina, Uruguay, and in Brazil. To promote cooperation among archival educators in South America, Red Iberoamericana de Enseñanza Archivística Universitaria was formed in 2000 as a permanent Committee of the ALA (Latin American Archives Association). RIBEAU translates as "Latin American Network of Archival University Training." The purpose of RIBEAU is to promote networking and to seek common solutions to Latin American problems in the field of archival education. In Argentina, archival education is the

subject of a debate between supporters of two types of degrees, on one hand, a specialized and independent course of archival education, and on the other hand, an integrated archival and library program. A third scenario considers a Professional level degree as a Librarian a pre-requisite for any archival training. In Peru the Archivo General de la Nación provides a training school that is not associated with a university and does not result in a formal degree.

In China, there is a strong tradition of archival education provided by a number of universities across the country, of which the Archives School at the Renmin University in Beijing is the largest. Programs range through vocational training courses, university-based courses at bachelor and master level, and doctoral degrees.

In Africa, university-based professional education for archivists is available in South Africa and at the Library and Archive School in Ibadan, Nigeria. An archival training program in French is also available in Dakar, Senegal. There is a strongly expressed need for assistance in developing capacity for archives and records management education in other African countries and in some countries of the Arabic-speaking world.

In Australia, university programs are also offered at both bachelor and master level, taking a recordkeeping continuum approach to archival science as described, for example, by Frank Upward and Sue McKemmish,^[14] integrating what the life-cycle model separates into records management and archives. The first archival education program offered entirely by distance education without any requirement for students to attend on-campus commenced in 1994 offered by Edith Cowan University in Australia.^[15,16] Caroline Williams reported on a survey of archival education programs at the International Congress on Archives in 2004,^[17] at which date there were already over 30 institutions providing courses by distance education in a wide range of models, ranging from paper-based correspondence courses to full online delivery.

Competency Standards

The development of a standard set of competencies for archivists has been the subject of much interest in the profession for more than a decade, accompanied by a debate about whether or not competency models are an appropriate basis for professional education programs in higher education institutions. Marian Hoy^[18] points out that there is no clear and universally accepted definition of competencies, but notes that:

The National Training Information Service (NTIS) of the Australian Government defined competency standards as follows: "Competency Standards describe the skills and knowledge required for a person to operate effectively in the workplace. The standards have been defined by industry, are nationally recognised and form the basis of

training for that specific industry. Standards contain descriptors of outcomes to be achieved and criteria for performance."

Thus they provide benchmarks for assessment of achievement in training programs and are also useful for classifying job descriptions according to the level of performance required. Margaret Crockett^[19] points out that competency standards also

Facilitate recognition of skills across national boundaries; enable workforce mobility; improve professional knowledge and practice; help implement ARM standards; provide benchmark[s] for non-professional stakeholders.

In Australia, the *Records and Archives Competency Standard*^[20] was first published in 1997, having been compiled with the active input of representatives from the Australian Society of Archivists and the Records Management Association of Australasia. Marian Hoy^[21] provides a useful comparison of competency frameworks as an appendix to her article, which explores the structure, uses, and issues surrounding the Australian competency standard.

The National Training Information Service (NTIS) manages the maintenance and revision program for the Standard, which in turn forms the basis of Training Packages for records management training programs available through Innovation and Business Skills Australia^[22] and provided by Technical and Further Education (TAFE) Colleges, which provide a nationally standardised system of vocational training and by other Registered Training Organizations. The NTIS maintains a system for assessing and registering trainers. Nevertheless, standards that document competencies are generally designed for and more suited as an evaluation tool for training than for education programs, which aim to provide a deeper and broader experience than the acquisition of a static set of skills.^[5] Therefore the Australian Society of Archivists and the Records Management Association of Australasia developed a *Statement of Professional Knowledge* (2006)^[23] as a basis for their work in accrediting and recognising university-based programs in archives and records management.

ARMA International's Education Development Group launched a project in 2005 to develop a set of competencies for records and information management professionals, which culminated in publication of the *Records and Information Management Core Competencies*^[24] in 2007. The ARMA International project is a sound exemplar for approaching the development of a competency standard. It brought together an expert panel to create a first draft of the competency model, which was then validated against other models, including those from Australia and Canada. The second draft was then subjected to a survey of 2000 volunteers from the ARMA membership to validate the panel's work and contribute to the final weighting structure.^[19]

In 2006, competencies for the archival profession were among the main topics for discussion at both the 7th European Conference on Archives in Warsaw and at the Society of Archivists (United Kingdom) annual conference. One outcome of the European conference was a resolution^[25] to:

- “Encourage the European Branch of the ICA (EURBICA) and the Section for Professional Associations of ICA (SPA) to carry out a feasibility study for a project to develop a European competency framework for the archival profession;
- “Recognize the need to develop and sustain professional standards through certification procedures for individuals, organizations, and education programs;
- “Underline the need to advance the creation and development of virtual educational tools for promotion of online training through the use of new technologies.”

The conference participants also resolved to “encourage the key educational institutions teaching archivists to:

- “Strengthen cooperation and common initiatives in order to increase the quality of archival education;
- “Improve tools for the assessment of the quality of archival education for accreditation.”

The Role of Professional Associations in Education and Training

The two peak professional bodies for records managers and archivists play an important role in supporting professional education and training, as do many of their national counterparts. The International Council on Archives (ICA)^[26] makes education and training one of its four strategic priorities, while ARMA International^[27] is itself a provider of training which includes online courses. Provision of the ARMA certification program is contracted to the Institute of Certified Records Managers (ICRM).^[28] Applicants receive the CRM designation by meeting both educational and work experience certification requirements established by the ICRM and by passing the required examinations. Two of the regional branches of ICA play an active role in the provision of training programs. EASTICA,^[29] the East Asian Regional Branch, in cooperation with the Hong Kong University runs four-week intensive courses (2003, 2004, 2007, 2008) leading to the award of a Postgraduate Certificate in Archival Studies. PARBICA,^[30] the Pacific Regional Branch, provides training in association with its regular conferences and has worked intensively since 1999 to encourage the development of a formal education program in the region. However, their initial plan to establish a distance education program at the University of the South Pacific stalled due to a lack of funding commitment by the university. PARBICA is now working with a wider focus, and aims to

provide a clearinghouse of information on educational opportunities for archivists in the region.

Some national professional associations also assess and accredit university-based courses within their national boundaries. The Society of Archivists (United Kingdom) does so, and provides a further program that mentors new graduates toward Registration over a minimum period of 3 years after graduation,^[31] but there is no further requirement for refreshing professional knowledge.^[32] The Australian Society of Archivists (ASA), Inc.^[33] and the Records Management Association of Australasia^[34] both have accreditation programs for university-based education programs. Graduation from a recognised program facilitates progress toward professional status in these two organizations. In the ASA, graduation from an accredited course shortens the route to professional membership, but is not an essential qualification. The Society of American Archivists (SAA) does not accredit programs, but provides a set of *Guidelines for a Graduate Program in Archival Studies* which the SAA considers “defines the minimum requirements for a graduate program in archival studies that is coherent, independent and based on core archival knowledge.”^[35] The Norwegian professional association Norsk Arkivråd^[36] plays an active role in encouraging the development of archives and records management education and itself provides training courses and sponsors workshops for those already working in the profession. The Finnish Association of Business Archivists provides training in records management,^[13] inspired by the American Certified Records Manager program sponsored by ARMA International. The German Association of Business Archivists^[37] is also a provider of records management training programs.

National professional associations in general provide some form of continuing professional development programs, yet few make active participation a condition of continuing professional status, although Margaret Crockett,^[32] for example, argues that this is one of the hallmarks of professionalism. The Records Management Association of Australasia requires professional members to submit an annual return as evidence of having met minimum requirements for participation in approved activities such as attendance at conferences and training courses, presentation of papers, or publications. A more rigorous approach to continuing professional development would require a system of accrediting either training providers or training courses to provide quality assurance, yet evaluation and endorsement of training programs is often seen as too difficult, or simply beyond the capacity of professional associations, although they are willing to undertake accreditation of university-based professional education programs.^[5]

There are also some scholarships funded by professional associations to encourage those studying for professional qualifications. These include ARMA International's Educational Foundation,^[38] the Association of Canadian Archivists Foundation,^[39] the Records Management

Association of Australasia^[40] and the Indigenous Special Interest Group of the Australian Society of Archivists' Loris Williams Scholarship, set up to support Aboriginal and Torres Strait Islander students in archives and records.^[41] Positive action for training archivists and records managers from ethnic minorities is an important development, particularly in countries where issues surrounding the past treatment of indigenous people is in the process of being addressed, or the proportion of recent immigrants is increasing.

ICA Section for Archival Educators and Trainers

The ICA Section for Archival Educators and Trainers (ICA-SAE)^[42] was formed after decisions taken at the 11th International Congress on Archives in Paris in 1988. In 1990 it succeeded the ICA Committee on Professional Training (ICA/CPT) which had been founded in 1979. It aims to provide professional support for educators and trainers worldwide and has more than 100 members spread across all continents. Its objectives are:

- To promote cooperation between archival training institutions and all those who are responsible for the education and training of archivists, and of other archives professionals.
- To assist in the development of archival research and the definition of standards, methods, and qualifications for archival education.
- To gather and disseminate information about programs of training institutions and other training activities and evaluate them.
- To cooperate with other bodies of the ICA in the preparation of training activities, training programs, and teaching for the various fields of archival work.

It has produced a range of publications and resources for teachers and trainers. Among the most notable are *What Students in Archival Science Learn. A Bibliography for Teachers*,^[43] a classified bibliography of resources in a wide range of languages. Jeannette Bastian and Elizabeth Yakel^[12] note that this work reports

on the frequency with which specific readings that were used and identified which archival education programs assigned a given reading. Unfortunately, there was no analysis of these usage patterns or implied interrelationships between programs. Still, this later work represents a significant snapshot of readings assigned in different archival courses.

More recently ICA-SAE has developed and published the *Train the Trainer Resource Pack*,^[44] which has been translated into Spanish, Bahasa Indonesia, Portuguese, and French, with translations into more languages proposed. The *Train the Trainer Resource Pack* is an

important means of increasing training skills among professional archivists and records managers. These training skills will enable sharing of professional knowledge and expertise more effectively in in-house training programs, courses for volunteers and in continuing professional development programs.

ICA-SAE works with educators around the globe to hold regional conferences, aiming to bring educators and trainers together to form regional networks, developing a community of practice through which knowledge is shared and capacity in education and training is increased. Since 1988, 17 international conferences have been held.

Providers of Education and Training

Many national archives provide in-house training for their own staff and those that have a legislative mandate to control and monitor recordkeeping standards in government usually also provide at least some basic training for records managers in government agencies. In some countries where there is little or no access to formal professional education, such training is crucial. However, few are able to cater for those in recordkeeping roles in nongovernment organizations. Some countries host training programs for archivists in other countries. Examples include the Les Stages Techniques Internationaux d'Archives, through which the Archives Nationales de France provides training programs for archivists in the francophone world; the Postgraduate Diploma course at the National Archives of India; the National Archives of Malaysia which provides training workshops and participates in exchange of archivists with other ASEAN countries; the Riksarkivet (National Archives) of Sweden in association with SIDA (the Swedish International Development Cooperation Agency) provides a course *Records Management in Service of Democracy* for archivists and records managers from African countries, followed up by visits by the course leaders to the participants in their own countries.^[45] Russian training expertise has also historically been available to former Soviet countries. Other national archives provide active support for courses and training activities offered through ICA Regional Branches, as for example support for PARBICA programs provided by the National Archives of Australia and Archives New Zealand.

The International Records Management Trust (IRMT) was established as a nonprofit organization in 1989 "to respond to widespread and progressive deterioration in recordkeeping in the developing countries."^[46] Its current goal is expressed as an aim to help "governments and organizations move to electronic environments by building trustworthy records management systems as a foundation for data integrity and management information systems."^[47] One of the three major foci of the Trust is the provision of education and training programs, provided through a network of international professionals.

It also undertakes research on the relationship between records management and governance and provides consultancy services, all of which inform the development of its training products. The IRMT's study materials can be downloaded and used without charge.^[48]

The ICA-SAE publishes a *Directory of Archival Education and Training Institutions*. The first edition was published in 1992 and the second edition in 2004.^[49] The Directory is incomplete for several reasons. The first is that the information gathering used a snowball technique, commencing with members of ICA-SAE at the time and depending on them to send the survey to organizations in which those members had contacts. The second reason is that submission of entries is entirely voluntary and dependent on providers completing and returning information to the editors. Thus there are gaps in the data for the francophone world, for Africa, South America, and for the United States. However, the SAA provides an online *Directory of Archival Education*^[50] which is kept up to date by education program providers. The ICA-SAE *Directory* also focused on university-based programs and only two providers of professional training courses outside formal university programs submitted an entry, yet the provision of short training courses is an important means of building capacity and improving professional skills in most countries, including those where university-based courses are available. Since the data were gathered for the last edition, new courses have begun in Japan, Switzerland, New Zealand, and South Korea, for example, and in Australia some courses have ceased and a new one has commenced. The Section therefore plans to revise the content and provide a facility for education and training providers to update their own entries online. Providers may submit a new or revised entry by contacting the ICA-SAE at <http://www.ica-sae.org>.

CAREER OPPORTUNITIES

Archivists and records managers have a wider range of career opportunities than ever before, and the options are growing. National, state, and regional archives remain the largest organizational employers of recordkeeping professionals in every country. National archives with a legislative mandate to play a key role in ensuring good governance and accountability have a strong role in the development of policy and standards for recordkeeping across the whole of government. They employ professionals who can research and develop jurisdiction-specific policies and standards for recordkeeping best practice, as well as developing and providing the advice, training and tools to assist compliance in government agencies' records management programs. Archival organizations now provide access to their services and collections via the World Wide Web and thus need recordkeeping professionals appropriately educated with the skills to manage the

provision of these digital services. As governments increasingly move toward providing public services via the Internet, professionals able to provide the necessary recordkeeping infrastructure that underpin e-government are in ever-increasing demand, along with expertise in data protection and privacy legislation. Large archival organizations provide opportunities for promotion through a structured career path as well as opportunities to gain wider professional expertise by moving across internal departments and services. The services of records managers are also in high demand in business and nonprofit organizations of all types. Records and information management professionals, with their systematic knowledge of organization-wide information structures, are well-qualified to take high-level positions as Chief Information Officers (CIOs). Qualified and experienced professionals who set up their own business as free-lance consultants or work for larger providers of professional consultancy services are in high demand to manage or undertake short to medium term projects that require professional expertise, or for filling temporary staffing shortages.

There is a wide range of other types of archives, as evidenced by the growing number of special interest sections of professional associations. In the International Council on Archives,^[51] these include: Notarial Records, Architectural Records, Business and Labour Archives, Archivists of International Organizations, Archives of Churches and Religious Denominations, Literature and Art Archives, Municipal Archives, Sports Archives, Archives of Parliaments and Political Parties, University and Research Institution Archives as well as a Section for Archival Educators and Trainers, and a Section for Records Management and Archival Professional Associations. Many national professional associations for archivists host similar sub-groups to cater for the sectoral interests of their members. For example, the SAA hosts a similar range and also includes groups focused on particular archival functions, such as Acquisition and Appraisal, Reference, Access and Outreach, and Preservation, together with a section on Museum Archives. Museums and galleries frequently contain archives to support and extend their collections and collectively employ a considerable number of archivists, although the majority of such collections are small and often have only one archivist, or part-time volunteers. Community archives are also increasingly in evidence. The United Kingdom provides a number of examples of these, where communities and immigrant groups work to develop collections that record their memory, their experience of arrival, settlement, community development, and traditions old and new.

The Australian Society of Archivists also has special interest groups covering the usual spread of special interests, but also caters for Electronic Records, for School Archives, and for Indigenous Issues (IISIG). The IISIG has been formed for professionals with Australian and Torres Strait Island indigenous heritage and professionals

who work with managing and providing access to records about indigenous people and the issues surrounding their treatment in the past. The Association of Canadian Archivists also has a Special Interest Section on Aboriginal Archives (SISAA).^[52] Archivists who work with film and sound archives and in broadcast television and radio have their own professional association and the international body is the Co-ordinating Council of Audiovisual Archives Associations (CCAAA).^[53] There are currently very large projects underway in a number of countries to manage the transfer of analog television and film archives to digital format in such a way as to ensure it is preserved and retrievable in the long-term.

And finally, but certainly not least, the role of educator or trainer for the recordkeeping professions is a particularly rewarding and stimulating career choice that requires sound academic achievement and well developed research, communication, and training skills.

ACKNOWLEDGMENT

The author is indebted to Dr. Helen Forde for her suggestions for improving this entry. Also, I am indebted to Professor Anna Szlejcher of the University of Cordoba for information about archival education in South America, particularly in Argentina and the development of RIBEAU.

Careers and Education in Information Systems

Paul Gray

Lorne Olfman

School of Information Systems and Technology, Claremont Graduate University, Claremont, California, U.S.A.

Abstract

This entry discusses the nature of information systems (IS) and the educational opportunities and careers in the information systems field within library and information science (LIS). The entry includes descriptions of the types of institutions that teach IS from a LIS point of view, standard curricula for B.A. and M.S. degrees, careers open to graduates from beginners to skilled professionals, and opportunities for continuing education. These educational possibilities are put in perspective by considering the nature of the IS industry with which professionals deal, the strategic use of IS in libraries, and the future directions of IS.

INTRODUCTION

Managing the vast stores of information and knowledge in libraries, in databases, and in knowledge repositories involves deep understanding of information systems (IS). This entry discusses the nature of IS and the educational opportunities and careers in the field.

University education in IS is centered principally in schools of business whose research objectives are to improve the application of IS in (usually profit-maximizing) organizations. Libraries are considered a specific field of application. IS studies in business schools and other departments such as computer science generally cover the fundamentals, but they do not emphasize the role of IS in library and information science (LIS). The uses of IS in LIS are taught principally in schools of information or informatics that emerged from schools of LIS. These schools usually offer full degrees or minors in IS specifically directed to libraries. Their emphasis is on the creation, processing, storing, and retrieval of information and knowledge.

A way of thinking about the use of computers in libraries is that it is similar to electronic commerce (e-commerce), the conducting of business over the Internet or over private networks. Many current library activities are forms of e-commerce. At the customer level, if you or I want a paper or a book or a question answered, we interact with the library in a way that is similar to e-commerce—ask for something and it is delivered electronically. On the supply side, libraries buy information electronically from JSTOR and other database providers such as LexisNexis, and obtain copies of books and journal articles from other libraries by e-order. E-mail is universal. All these activities depend on design and management of the IS behind them. In short, IS are at the core of how twenty-first century libraries really operate.

In keeping with the authors' backgrounds, this entry provides a view of IS in general. It covers the following topics:

- Differences among IS, computer science, computer engineering, and LIS.
- Education in IS: B.S., M.S., and Ph.D. level curricula.
- Schools of Information and Informatics.
- Training and continuing education.
- The IS industry (vendors, service providers, out-sourcers, internal IS groups, and consultants).
- Specializations and job categories in IS (including total employment nationally and internationally).
- Careers in IS (in internal groups in institutions; in external vendors; working with user groups; “verticals” such as health, communications, technology vendors, education; joint projects between firms, departments; and global teams).
- Professional associations in IS.
- Strategic use of IS.
- Future of IS.

INFORMATION SYSTEMS VS. LIBRARY AND INFORMATION SCIENCE VS. COMPUTER SCIENCE VS. COMPUTER ENGINEERING

While IS, LIS, computer science, and computer engineering are all concerned with managing information and knowledge, they are studied (and consider themselves) as different disciplines. In this subsection we consider the similarities and differences among them.

Library and Information Science (LIS) is defined in Prytherch^[1] as

the study and practice of professional methods in the use and exploitation of information, whether from an

institutional base or not, for the benefit of users. An umbrella term, abbreviated LIS, is used to cover terms such as library science, librarianship, information science, information work etc.

In terms of IS, LIS focuses on such areas as document and records management and knowledge.

Computer Science (also called computing science) involves studying the foundations of information and computation and their application in computers. It is also concerned with computer languages and computer software.

Computer Engineering (also called electronic and computer engineering) combines computer science and electrical engineering. It focuses on software design, computer hardware design, and the integration of hardware and software.

Information Systems (IS) involves the study of the “(1) acquisition, deployment, and management of information technology resources and services . . . and^[2] development, operation, and evolution of infrastructure and systems for use in organizational processes.”^[2] Information systems differ from computer science and computer engineering in that the latter two are concerned with the creation of hardware and software rather than with their organizational implications. Information systems as a whole is a superset of IS within LIS.

EDUCATION IN IS

Table 1 summarizes the educational enterprise in IS. Degrees in IS are available at the

- Undergraduate
- Masters
- Ph.D.

levels. Model curricula and accreditation are available in the United States at the bachelor's and M.S. levels. Ph.D. programs are not standardized in this way. The most recent model curricula are published respectively in Gorgone, Davis et al.^[2] for the undergraduate degree and in Gorgone, Gray et al.^[3] for the master degree.

In the United States, these degree programs are housed in

- Schools of Information and Schools of Informatics.
- Schools of Business.
- Schools and Departments of Computer Science.
- Schools of Liberal Arts.

Many, but not all of the Schools of Information and the Schools of Informatics are descendants of Schools of Library Science that changed their name and expanded their offerings and their faculty to include IS (see discussion below).

UNDERGRADUATE MODEL CURRICULUM

The undergraduate curriculum^[2] is based on the following image of the IS professional with a bachelor's degree:

1. Has a broad real-world perspective.
2. Has strong analytical and critical thinking skills.
3. Has interpersonal communication and team skills and strong ethical principles.
4. Designs and implements information technology solutions that enhance organizational performance.

The curriculum is directed to people studying in business administration programs but is tailorable to students studying in other disciplines such as LIS. Specifically, it contains:

1. General courses in IS suitable for all students regardless of their majors or minors.
2. Specialized information technology and application design courses for both majors and minors in IS.
3. Specialized application development, deployment, and project management courses for majors in IS.

The output desired for IS majors, is shown in Fig. 1.^[2] The course structure is shown in Table 2.

MSIS CURRICULUM

The M.S. model curriculum^[3] is directed to create graduates who are prepared to provide leadership in the IS field. M.S. graduates should have the same skills, knowledge,

Table 1 Information systems education.

Academic level	Model curriculum	Depts/schools in universities	Delivery of offerings
Undergraduate	IS2002 ^[2]	Schools of Business	Full time
M.S.	MSIS 2006 ^[3]	Schools of Business, Schools of Information	Full time, part time, remote via Internet or video
Ph.D.		Schools of Business, Schools of Information	Full time, part time, remote via Internet or video
Training and continuing education		Short courses, certificates	In class, on site, and remote (e.g., via the Internet)

Fig. 1 High-level categorization of IS graduate exit characteristics.

and values as B.S. or B.A. graduates (Fig. 2^[3]) but at a higher level.

The M.S.I.S. course set recommended for IS professionals is listed in Table 3.

To be eligible to take these courses at the M.S. level, students are expected to have completed four prerequisite courses: two in IS:

- IS fundamentals
- Programming, Data, Files, and Object Structure

and a two-course sequence in business functions and processes.

All four prerequisite courses are usually already completed by students with an undergraduate degree in IS. However, students coming from other majors, such as LIS, may be required to take some or all of these prerequisites if they did not take them as undergraduates.

The M.S.I.S. program shown in Table 3 consists of 12 courses divided into three parts, each consisting of four courses.

- IS technology.
- Managing IS.
- A coherent sequence in a specialization area.

IS technology. The IS technology courses, shown in Table 4, focus on the broad range of technology-based topics that an M.S. student needs to know. Some topics appear in several courses because they are discussed from different viewpoints. The amount of time devoted to topics varies; for example, the discussion of human–computer interaction is extensive in the analysis, modeling, and design course because of the importance of the human factor in that subject.

Managing IS. No matter what the size of the organization, successful operation requires a working, and preferably highly efficient IS. IS management turns out to be one of the more complex problems organizations face. In libraries, as in most business organizations, IS are viewed as overhead that is necessary but whose costs should be minimized. Yet minimizing cost requires a trade-off with service.

Table 5 shows the suggested content of the management courses.

Specialization track. The purpose of the specialization track is to teach students about the specific field they want to work in and to provide field experience through a practicum. IS programs, given the need for economies of scale and the available skills of their faculty, usually can offer only three to five different specialization tracks. The tracks are usually technical, organizational, human factors, or tailored to specific industries that are prevalent in an area (e.g., software in Seattle, financial institutions in New York). Typically, the specialization tracks involve selection from among elective courses. Note that specialization tracks can be lockstep or custom tailored to individual students by mixing and matching electives.

In schools of information (see next subsection) that offer both library science and IS degrees, one of the specialization tracks is based on issues paramount in LIS (e.g., courses in databases, data retrieval, information issues, knowledge management, and more specialized

Table 2 IS2002 course structure for undergraduates.

Prerequisite	IS 2002.P0 Personal Productivity with IS Technology
Information systems fundamentals	IS 2002.1 Fundamentals of Information Systems
	IS 2002.2 Electronic Business Strategy, Architecture and Design
Information systems theory and practice	IS 2002.3 Information Systems Theory and Practice
Information technology	IS 2002.4 Information Technology Hardware and Software
	IS 2002.5 Programming, Data, File and Object Structures
	IS 2002.6 Networks and Telecommunications
Information systems development	IS 2002.7 Analysis and Logical Design
	IS 2002.8 Physical Design and Implementation with DBMS
	IS 2002.9 Physical Design and Implementation in Emerging Environments
Information systems deployment and management processes	IS 2002.10 Project Management and Practice

Source: Gorgone et al.^[2]

Fig. 2 M.S. level output model.

issues such as geographic IS). In M.S. programs located in schools that do not offer library science, the specialization track requires selection of appropriate electives.

The conclusion from this brief survey is that potential students and faculty with interests in both library science and IS should read school descriptions carefully if their interest spans the two disciplines.

TRAINING AND CONTINUING EDUCATION

Because of the rapid changes in information technology and software, even highly educated practitioners require updates to their skill sets. As a result, a large number of training offerings are available commercially or through universities. These offerings typically span from 3 to 5 days. Vendors offer courses at multiple locations on a weekly or monthly basis. Moreover, they produce online training (CDs, DVDs, and Internet accessible) for many software and hardware products, including the most popular ones produced by Microsoft, Oracle, and Cisco. These companies offer certifications that claim that the person who obtains them is qualified to install and maintain the

related products. Many information-related jobs call for such certifications, although the value of these certificates seems to be declining.^[4] Leading-edge libraries offer training for software that supports specialist areas such as geographic IS, statistical analysis systems, databases, and bibliographic systems. Information professionals who want to manage information departments and resources often attend one of the part-time, evening M.S. programs in IS available in most urban areas. Community colleges also offer courses and associate degree programs in IS.

THE IS INDUSTRY

Information systems pervade American organizations, including libraries. To create and service these organizations, a large number of

- Equipment manufacturers
- Software firms
- Service providers and outsourcers
- Internal IS organizations
- Consultant organizations

Table 3 M.S. courses.

IS technology	Managing IS	Specialization tracks
IT infrastructure	Project and change management Strategy and policy Implication of digitization Integrated capstone	Four courses in depth in a particular subject area including, where possible, a practicum course involving experience in an organization
Analysis, modeling, Design, including Human-Computer Interaction Enterprise Systems Emerging technologies and issues		

Table 4 Contents of the technology courses.

IT infrastructure	Analysis, modeling, and design	Data and data management	Emerging technologies and issues
IT architecture	Human–computer interaction	Information content	Data mining
Enterprise Information Infrastructure	Systems development methodologies	Distribution	Sourcing
Servers and Web services	Requirements determination	Process management	Web services and business processes
Layered network architecture	Team organization and communications	Data warehousing/data marts	Technology convergence
Internet protocols	Feasibility and risk analysis	Data mining	Security
Global WAN services	Design reviews	Managing storage area networks	Organizational intelligence
Enterprise network design	System development life cycle	Large systems (ERP)	Knowledge management
Wireless technologies	Conceptual and logical data modeling	E-commerce	Mobile computing
Network management	Database implementation	Content management	Ubiquitous computing
Server architectures	Data organization		
Storage management and networks	Software and systems metrics		
	Software package evaluation

were created over the years. The stories of vast wealth accumulated by the founders of many of these organizations are part of the folklore. In this section we describe the role of each of these types of organizations and their relation to libraries.

Equipment (hardware) manufacturers. When computers first came on the scene commercially in the 1950s and 1960s, the focus was on building computers and peripheral equipment such as displays and printers. The

machines were large, horribly expensive, and designed for medium and large firms and government agencies that could afford them. Following the introduction of the IBM PC Model 51 in 1981, personal computing became generally available and is now pervasive.

The technology broadened so that it now includes telecommunications that allows computers to be networked together. Telecommunications, in turn, made it possible to connect to the Internet. Where previously connection

Table 5 Suggested content of the managing IS courses.

Project and change management	Implications of digitization	Policy and strategy	Capstone
Project life cycle	Ethics	Relationship between IS and the business	The enterprise as a system of integrated business processes
Project stakeholders	Privacy	IS and competitive position	Relationships with suppliers and customers
Project planning	Govt. regulations	Aligning IT goals and strategy	Strategic alignment of IT with the business
Software cost estimation	Globalization and sourcing	Creating IT values, vision, and mission	IT organization and governance
Work module design, assignment, version control	Intellectual property	IT strategic planning, infrastructure planning and budgeting	The value of IT
Role of repository, project library	Virtual work and telecommuting	IS implementation	Role of the CIO
Contingency planning	Implications of artificial intelligence	Inter-organizational systems	Sourcing
Reporting and controls	Security measures and planning	Outsourcing versus insourcing	Compliance
Testing and testing plans: alpha and beta	E-commerce	Globalization	Integrated enterprise architecture
Project Manager skills	Digital divide	Risk management	Platform choices
	IT workforce	Virtual organization	Impact of standards
			Vendor strategies

to the electric power grid was required, computer equipment is moving to wireless. Miniaturization led to ever less space being required and less heat generated.

Computer prices dropped from millions of dollars in 1960 to thousands today and computer user skills are nearing universality. The result is a computer-literate population that is accustomed to the digital life. The drop in costs made it possible for libraries and information repositories to use the technology to improve service and capabilities. However, recognize that while individual personal computers are cheap (prices under \$1000/unit for the hardware are common), the large number of individual units required, as well as the cost of servers, networking, and peripherals still makes the total cost of ownership considerable for an organization. The term servers, as used here, refers to dedicated computers that provide software and other services to computers on a network. In some arrangements, a server can also be used to do local computations.

Software firms. In the early years of computing, software was literally given away with the hardware, since programmers were few and programming computers was a highly complex, skilled art. By the early 1960s, firms sprang up that offered software commercially with different versions compatible with the major mainframe types. The software was high priced and was almost exclusively rented. That is, ownership did not pass to the purchaser. Rather, the software firm charged an initial price and then an annual maintenance fee, typically equal to 15% of the initial price. The result was lock-in. That is, once a particular piece of software was acquired, it became quite expensive to switch to another vendor. An annual maintenance fee was charged by the software firm to cover its cost of revising and updating the software as the hardware changed and additional features were added. For PCs, the policy is different in that its copies of software are cheap and it is possible to own the software. However, upgrades of the software must be purchased, often at or near the same price as the original. Maintenance requires separate contracts.

The range of software available expanded over the years. Typical office suites offer word processing, spreadsheets, presentation graphics, small databases, and more. Specialized software is required for large databases for data warehousing, for knowledge management and other subjects of interest to libraries.

The Internet is a separate issue. Software for access (i.e., browsers) is currently free, but hardware is required for connection. The major problems of the Internet deal with content. In addition to viruses, worms, spyware, and other “malware” directed toward ruining or interfering with content, spam is a major concern. Spam refers to unsolicited, unwanted advertising, most of it for dubious products. For libraries, be they public or in a corporation, access to pornography over the Internet needs to be avoided. Software to deal with these issues is available,

but it is not perfect. In fact, there is an arms race between providers and preventers of improper information, with one side or the other ahead at any particular time. Another content aspect is copyright protection where computer users want access to copyrighted material to which they are not entitled. Liability issues on copyright were still in contention when this entry was written in 2008.

Service providers and outsourcers. Libraries are faced with a classic “make or buy” problem. Although they can create their own computing environment, most purchase all or part of it from vendors such as catalog and database providers. Vendors include application service providers (ASPs) and outsourcers. ASPs provide computer-based services to customers over a network. A classic example is the Internet Service Provider (ISP) who offers connections to the Internet.

Outsourcers are contractors who perform computer work ranging from internal production to managing a firm’s operations to providing call centers. The movement of such work is called outsourcing and offshoring. Offshoring refers to contracting beyond the boundaries of the country whereas outsourcing usually refers to moving work domestically. Domestic outsourcing, of course, simply shifts jobs from an organization to a firm that specializes in some aspect of IS but still employs domestic workers. Although newspapers and magazines are filled with stories about moving jobs from high-wage western countries to low-wage countries such as India and China, only a small portion of IS jobs have moved overseas. For example, a 2008 survey shows that approximately 1.1% of IS jobs were offshored and that the trend is toward less offshoring and more domestic outsourcing in the future.^[5] Although small in percentage of jobs, offshore software outsourcing still involves large sums of money. For example, a study published in November 2007^[6] estimates revenues of near \$55 billion alone for India, China, Malaysia, and the Philippines.

A growing number of firms provide “Software As A Service.” That is, work is sent electronically to the ASP either over the Internet or on a private network. The ASP provides the computers and software that performs contracted tasks. The advantage is that the library does not need to perform that work internally at the cost of giving up some control over the work and how it is performed.

Internal IS organizations. Where a library system (usually with multiple locations) is a government service, their information operations may either be outsourced to a centralized information group that provides services to a number of government agencies or may be served by its own IS organization. Internal organizations, like those in businesses often have the advantage that they are part of the organization and know its needs. They can be more responsive in terms of both time and resources made available. This characterization assumes that the internal organization is not dysfunctional as internal IS operations

sometimes can be. With an internal IS function, the library system is locked into its organization. If the internal organization is dysfunctional, outsourcing is one way of attempting to resolve the dysfunctionality.

Consultant IS organizations. IS consultants are called in when a specific problem needs to be solved and the organization does not have the skills or the personnel needed within their internal organization. Consultants do not come cheap. They are experienced, quality people and operate in a high overhead environment since they need to cover not only their costs while employed by a client but also their costs when between engagements.

Hiring consultants is, in effect, renting knowledge. It is a speculation. It is not possible to predict whether the consultants' work will pay off. They are hired based on the reputation of their organization and people, their past success, and their potential. Knowledge rentals involve knowledge transfer from the consultant to the client. Even though consultants are temporary hires, some knowledge will stay after they leave. Some consultants offer training as part of their service. Although libraries seek their help in solving specific problems, it is wise to write the consulting contract to include knowledge transfer.

SPECIALIZATION AND JOB CATEGORIES IN IS

The United States Bureau of Labor Statistics (BLS) provides a classification and comprehensive description of information-related jobs and requirements, the number of persons (currently) employed in these jobs, and a forecast of the expected growth in the number of these jobs. The statistics presented in this section are from the 2008–2009 version of the *BLS Handbook*. Libraries typically keep only the latest annual version of the *BLS Handbook*. Thus, the data presented in Table 6 are, in some cases, obsolete in years beyond 2008. However, it is our experience that the categories and numbers change slowly. Thus, the categories and the data will remain indicative over the next several years.^[7]

Categories of taxonomies almost always overlap; job taxonomies are no different. The BLS does not directly classify jobs as information-related. The BLS classifications do not map one-to-one into the educational categories discussed previously. The differences, however, are not significant. BLS lists most information-related jobs in its professional occupations. However, some are included in the Business and Financial, Administrative, and Management occupation categories. Except for Computer Programmers and Librarians (both classified as professional), job growth through 2016 is predicted to be faster or much faster than average. Table 6 lists 11 BLS information-related categories that require at least a bachelor's degree along with a job description, current and expected employment figures; and median salary.

CAREERS IN IS

While the BLS classification provides a tool for understanding the current and future employment possibilities for the main groups of information-related jobs, a more direct description of jobs available to graduates of information programs can be inferred from job advertisements. A search of jobs advertised on Monster.com^[8] in eight major urban areas in the United States (within a radius of 50 mi from Los Angeles, San Francisco, Denver, Dallas, Chicago, New York, Philadelphia, and Atlanta), as of mid-July 2008 show a wide variety of job titles. Some of the titles vary by levels (e.g., Network Analyst and Network Manager), showing the natural career paths in many information-related jobs from entry level jobs (typically analysts and technicians) to senior positions (such as Manager or Chief Technology Officer). Job titles can be classified into domains (e.g., administrator, architect, analyst). Table 7 shows selected job titles by domain from the Monster.com search.

Table 8 maps the BLS occupational categories to job title domains and application areas (e.g., business systems, database, network). Salaries range from \$50,000 to well over \$100,000 with any specific job spanning a wide dollar amount depending on qualifications and experience. Jobs in the Information Technology field are classified into 12 different areas in Monster.com, including Computer/Network Security, Database Developer/Administrator, Enterprise Software, Information Technology/Software Development, Information Technology Project Management, Network/Server Administrator, Software/System Architect, Software/Web Developer, Systems Analysis, Telecommunications Administration/Management, and Usability. A search within these categories using a set of standard keywords for job titles provided the set of available jobs within the eight urban areas noted above. There is some overlap in available jobs using this method of search (see Table 9). While this table includes only a fraction of all jobs listed, it provides a fair distribution of jobs across different cities and job types. The highest paying jobs are more typically available in New York, Los Angeles, and San Francisco.

Within a traditional Information Systems department in a large organization, the normal hierarchy includes a senior manager (or Chief Information or Technology Officer); directors of the key IS functions, including database systems, systems development, systems maintenance, telecommunications and security, and user support. A typical career path for a specialist in database might lead from an entry level position to a database administration position, to a director of database systems, and then possibly to manager. IS managers need leadership and administration skills. They are typically experts in one of the department functions as the following discussion of career paths explains.

Table 6 BLS occupations in information fields.

Occupation	Job description	Employment 2006 and 2016	Salary median (2006) ^a (\$)
Computer Programmers	Write, test, and maintain the detailed instructions called programs that computers follow to perform their functions. Conceive, design, and test logical structures for solving problems by computer. With the help of other computer specialists, they figure out which instructions to use to make computers do specific tasks.	435,000 declining to 417,000	65,510
Computer and Information Scientists, Research	Work as theorists, researchers, or inventors. Their jobs are distinguished by the higher level of theoretical expertise and innovation they apply to complex problems and the creation or application of new technology. The areas of computer science research range from complex theory to hardware design to programming language design. They may work on design teams with electrical engineers and other specialists.	25,000 increasing to 31,000	93,950
Computer Software Engineers, Applications	Develop, create, and modify general computer applications software or specialized utility programs. Analyze user needs and develop software solutions. Design software or customize software for client use with the aim of optimizing operational efficiency. May analyze and design databases within an application area, working individually or coordinating database development as part of a team.	507,000 increasing to 733,000	79,780
Computer Software Engineers, Systems Software	Research, design, develop, and test operating systems-level software, compilers, and network distribution software for medical, industrial, military, communications, aerospace, business, scientific, and general computing applications. Set operational specifications, formulate and analyze software requirements. Apply principles and techniques of computer science, engineering, and mathematical analysis.	350,000 increasing to 449,000	85,370
Computer Systems Analysts	Solve computer problems and use computer technology to meet the needs of an organization. They may design and develop new computer systems by choosing and configuring hardware and software. They may also devise ways to apply existing systems' resources to additional tasks. Analysts who specialize in helping an organization select the proper system software and infrastructure are often called <i>system architects</i> . Analysts who specialize in developing and fine-tuning systems are often known as <i>systems designers</i> .	504,000 increasing to 650,000	69,760
Computer Specialists	Includes a variety of jobs such as Telecommunications Specialists, who focus on the interaction between computer and communications equipment; Webmasters, who are responsible for all technical aspects of a Web site, including performance issues such as speed of access, and for approving the content of the site; and Web Designers/Developers, who are responsible for day-to-day site creation and design.	136,000 increasing to 157,000	Not available
Database Administrators	Work with database management systems software and determine ways to organize and store data. They identify user needs and set up new computer databases. In many cases, database administrators must integrate data from outdated systems into a new system. They also test and coordinate modifications to the system when needed, and troubleshoot problems when they occur. An organization's database administrator ensures the performance of the system, understands the platform on which the database runs, and adds new users to the system.	119,000 increasing to 154,000	64,670
Network Systems and Data Communications Analysts	Design, test, and evaluate systems such as local area networks (LANs), wide area networks (WANs), the Internet, intranets, and other data communications systems. Network systems and data communications analysts perform network modeling, analysis, and planning, often requiring both hardware and software solutions. Analysts also may research related products and make necessary hardware and software recommendations.	262,000 increasing to 402,000	64,600
Computer and Information Systems Managers	Includes Chief Technology Officers, who evaluate the newest and most innovative technologies and determine how these can help their organizations; MIS/IT Directors, who manage computing resources for their organizations; and Project Managers, who develop requirements, budgets, and schedules for their firms' information technology projects.	264,000 increasing to 307,000	101,580

(Continued)

Table 6 BLS occupations in information fields. (*Continued*)

Occupation	Job description	Employment 2006 and 2016	Salary median (2006) ^a (\$)
Network and Computer Systems Administrators	Design, install, and support an organization's computer systems. They are responsible for LANs, WANs, network segments, and Internet and intranet systems. They work in a variety of environments, including professional offices, small businesses, government organizations, and large corporations. They maintain network hardware and software, analyze problems, and monitor networks to ensure their availability to system users. Administrators also may plan, coordinate, and implement network security measures.	309,000 increasing to 393,000	62,130
Librarians	Often called information professionals, increasingly combine traditional duties with tasks involving quickly changing technology. Help people find information and use it effectively for personal and professional purposes. Manage staff and develop and direct information programs and systems for the public and ensure that information is organized in a manner that meets users needs. Librarians with computer and IS skills can work as automated-systems librarians, planning and operating computer systems, and as information architects, designing information storage and retrieval systems and developing procedures for collecting, organizing, interpreting, and classifying information.	158,000 increasing to 164,000	49,060

^aNote that the data are based on 2006. Add at least a 3% annual increase for each year after 2006.

Source: *BLS Handbook*.^[7]

It is more likely that a career path would include lateral movement from one organization to another rather than lateral movement within organizations. For example, a database administrator may find a job at the same level in another company that may pay better or that will include use of a different database system, rather than move to a role in systems development in the same company. That is, people become specialized in their skills. Experience in particular technologies counts a great deal in developing a career path. Most job advertisements ask for specific experience. Specialization makes it difficult to begin a career in the IS field at other than the entry level. For example, a typical career can begin at a consulting firm that specializes in particular technologies. After gaining expertise in that technology, the next step might be to take a job in the organization that previously hired the individual as part of the consulting team to install its software system. Many IS jobs require certifications for using and applying specific technologies offered by companies such as Microsoft, Sun, and Cisco. Certification requires training but results in higher salaries, although the premium has been decreasing.^[4]

In small organizations, however, with only a small IS staff, each staff member is expected to have the skill needed to perform multiple functions. It is possible to move laterally and vertically back and forth between small and large organizations.

PROFESSIONAL ASSOCIATIONS

Whereas the American Library Association is the principal professional association for librarians, IS people

typically belong to one or both of the following two groups: The Association for Information Systems (AIS) and the Association for Computing Machinery (ACM). AIS consists almost exclusively of people who teach IS in universities and colleges whereas ACM (the much larger of the two associations) consists of both academics and practitioners with a focus on computer science rather than IS. AIS produces two electronic journals, *Communications of AIS (CAIS)* and the *Journal of AIS (JAIS)*. The flagship journal of ACM is *Communications of the ACM*. ACM also publishes a large number of specialty journals that deal with specific areas of computers and computer science.

STRATEGIC USE OF IS

The concept of strategic use of IS in libraries is used in two senses:

1. The creation of specific IS that provide a way of differentiating a library system from others.
2. A multiyear plan for operations into the future.

Differentiation. The goal of a strategic information system is to differentiate the organization by improving the organization's position. A strategic information system supports and shapes the organization's strategy, often leads to innovation in the way the organization conducts its work, creates new opportunities, or develops services based on information technology.^[9] In library systems, differentiation can be achieved by introducing new

Table 7 Job domains and job titles.

Job domain	Job titles
Administrator	Information Systems Administrator, Information Systems Database Administrator, Network Administrator, Senior Database Administrator, Systems Administrator
Analyst	Applications Systems Analyst, Business Analyst, Business Applications Analyst, Business Intelligence Data Analyst, Business Systems Analyst, Data Analyst, Help Desk Analyst, Information Security Analyst, Information Systems Analyst, Information Technology Analyst, Programmer Analyst, Quality Assurance Analyst, Senior Data Analyst, Senior Information Assurance Analyst, Senior Information Systems Analyst, Systems Analyst
Architect	Data Architect, Enterprise Architect, Information Architect, Information Systems Architect, Senior Information Architect, Software Architect, Web Information Architect
Auditor	Information Technology Auditor, Information Technology Senior Internal Auditor
Consultant	Business Systems Consultant, Implementation Consultant, Information Technology Consultant, Network Consultant, Senior Consultant Systems Domain, Storage Consultant
Designer	Application Designer, User Interface Designer, Web Designer
Developer	Application Developer, Database Developer, Information Technology Developer/Consultant, Senior Java Developer, Senior Software Developer, Senior Web Developer, Technical Developer, Web Developer, Web Developer/Image Librarian
Director	Director Clinical Information Systems, Director Information Systems, Director Information Technology, Global Information Technology Director, Information Technology Director
Engineer	Information Assurance System Engineer, Information Security Engineer, Information Security Network Engineer, Senior Engineer Information Systems, Senior Information Security Engineer, Senior Network Engineer, Senior Network Security Engineer, Software Engineer/Programmer, Systems Engineer, Technical Support Engineer

technologies (e.g., geographic IS, data warehouse), new services (e.g., adding an electronic data source), new analysis methods (e.g., data mining capabilities) and more.

Multiyear strategic planning. Library systems typically create their own multiyear strategic plan. A large number of such plans are found by using a search engine such as Google (e.g., Table 10 considers seven such plans). In examining these plans, the use of information technology is featured both for providing services and administrative support.

Whereas the strategic plans shown in Table 11 are concerned with the library system as a whole, IS departments also create their own strategic plan. To be effective, the department's and the system's plans should be aligned with one another. That is, they must be designed to achieve the same goals. However, in addition to supporting the system's goals, the department's work includes responsibilities that are unique to its operation, ranging from creating the needed infrastructure to

selecting new equipment and software to specifying personnel capabilities.

THE FUTURE OF INFORMATION SYSTEMS

Since the first commercial computer systems were installed in 1957, much changed in IS and even more changes can be expected. In this section, we present five of the many scenarios about the future of IS being discussed in 2008. The first four scenarios are based on a special issue on the IS Organization of the Future published in *Information Systems Management*.^[10]

1. *The future organization of the IS function.* As noted above, IS organizations tend to be hierarchical, with a Chief Information Officer (CIO) at the top reporting to a senior officer of the firm and supervising departments for technology, design, internal operations,

Table 8 Occupations, application areas, and job title domains.

Occupation	Application area	Job title domain
Computer and Information Systems Managers	Director	Applications Information Systems

computer security, and service to other departments and outsiders (such as through call centers). We use CIO to refer to the person in charge of information systems. The actual title may vary from one organization to another. With the trends to divesting many of these functions (e.g., through outsourcing and Software As A Service), the IS organization could well morph into a small group of technical and business experts managing the evolution of the organization's technology and a larger on-site group providing only maintenance-level services.^[11] However, in this case, IS career paths are not likely to change in that the same roles and functions are necessary for providing IS services by either insourcing or outsourcing.

2. *The IT talent challenge.* In response to the perceived trend to offshoring and as a result of the end of the stock market bubble in technology stocks in 2001, the number of students that chose to major in IS, computer science, and related fields has declined. That decline was starting to turn around in 2008. Nonetheless, the combination of a reduced demand for IS education at the college level and an aging baby boomer IS workforce results in concern for the

Table 11 Effects of changing technology on IS.

From	To	From	To
Standardization	Commoditization	Data management	Knowledge management
Technological continuity	Technology integration	User friendly	Usability standards
Proliferation of hardware types	Synergy among hardware types	Access security	Protection against terrorism

recruitment and retention of IS professionals because as the demand for professionals exceeds the supply, wages escalate.^[12] Therefore, IS becomes a valuable career with a long-term future.

3. *A move to Wi-Fi and telecommuting.*^[13] With the proliferation of portable technology (e.g., portable PCs, cell phones) and the continuing increase in the capabilities of these devices in a world without wiring, the current computer infrastructure is replaced by a wireless infrastructure that is able to provide large masses of data, information, and knowledge. Concomitant with the technology change, the workforce also becomes mobile and telecommuting^[14] is the dominant way people work. This virtual workforce is supported anytime, at anyplace, including library services. The combination of Wi-Fi and telecommuting makes it more likely that some IS professionals, particularly those involved in geographically dispersed projects do not have to move their home as their assignments change.

4. *Harnessing the Technology.*^[15] Table 11, shows how changing technology leads to changes in IS.

Note that in Table 11 as well as in each of the five scenarios, the focus is much more on technology and human factors than it is on the content being managed. The strength of people trained in both library science and IS is that they view issues in terms of content as well as technology.

5. *Carr's "IT Doesn't Matter" hypothesis.* In May 2003, the *Harvard Business Review* carried an article titled "IT Doesn't Matter" by Nicholas G. Carr.^[16] In this article and in a subsequent book,^[17] Carr argues that IS, like railroads and electric power, is an infrastructure technology that became a commodity. Initially strategic, IS is now a commodity, no longer offering advantage. Thus, something that everyone had would no longer matter as a way of distinguishing organizations from one another. Carried to its extreme, Carr's notion implies the death of organizational computing. Developments such as outsourcing and Software As A Service are viewed as omens of Carr's vision.

Which of these five alternative scenarios will play out in the years ahead? We expect that the predominating viewpoint will be some combination of these scenarios.

The foregoing represents visions of IS in general. When we turn to library IS, the future seems bright. These systems are coming into full flower compared to their role in business in general where IS are already in an advanced

state of maturity. The general coming shortage in people skilled in IS implies that people trained in library IS will continue to be in demand and, if their interests change, they will have the skills they need to be able to transfer their talents to many other applications.

One of the key trends in libraries is convergence, streamlining, and synergy. Instead of requiring users to go through multiple steps in research, including visiting library databases and online library catalogs, libraries are investigating ways to reduce the complexity of access such as federated search engines that combine databases, the online catalog, Web sites, and Open URL link resolvers (which provide links from non-full text citation/abstract databases to full text content). Libraries are also investigating innovative ways to market services and allow library users to match their tastes and research needs with library content in the Web 2.0^[18] environment. Examples include:

- Second generation catalogs with subject tag clouds and suggestions for similar reading.
- Podcasts.
- The use of social software such as blogs, Myspace, Facebook, and Second Life.

ACKNOWLEDGMENTS

We are indebted to Adam Rosencrantz of the Claremont University Center libraries for his in-depth discussions of this paper and for the example of the future of computing in libraries in the Conclusions section. We also thank the editor and an anonymous reviewer for valuable comments and suggestions.

Careers and Education in Library and Information Science

Jana Varlejs

School of Communication, Information and Library Studies, Rutgers University, New Brunswick, New Jersey, U.S.A.

Abstract

Preparation for professional careers in librarianship entails education at the master's level in many parts of the world. In North America, a degree from a program accredited by the American Library Association (ALA) is the credential preferred by most employers. While the content of library/information science education still includes traditional subjects such as reference, collection development, cataloging, and management, programs are including more courses on technology and electronic resources. Many programs are offering at least some of their courses online. Continuing learning is essential in order for librarians to adapt to rapidly changing information environments.

INTRODUCTION

Careers in librarianship may be pursued in a wide variety of settings, serve very diverse client groups, and entail quite different activities and responsibilities, ranging from storytelling to taxonomy design. There is commonality, however, which resides in the set of skills, knowledge, and attitudes that defines the profession. In much of the world, this foundation is acquired in graduate programs of library and information science. This entry deals primarily with careers and education in North America, although international developments are touched on briefly. Beginning with a general description of educational requirements, the discussion moves to the ongoing critiques of library and information science education, refers to resources on traditional and evolving career paths, and concludes with observations on trends in continuing education.

THE CONTEXT

According to the United States Bureau of Labor Statistics *Occupational Outlook Handbook*, there were about 158,000 librarians, 116,000 library assistants, and 121,000 library technicians employed in 2006. Growth in librarian positions from 2006 to 2016 is projected at 4%, but at 8% for assistants and technicians. The explanation given for the disparity is anticipated budget constraints, more work shifted to support staff, and sufficient increased enrollment in library education programs to replace retirees (<http://www.bls.gov/oco/ocos068.htm#emply>). Using the American Library Association's Library Fact Sheet 2, one can estimate that about 17% of librarians work in academic, 30% in public, 44% in school, and perhaps 10% in special libraries (<http://www.ala.org/ala/alalibrary/libraryfactsheet/alalibraryfactsheet2.cfm>).

The *Occupational Outlook Handbook* can be recommended as a fairly reliable brief introduction to the three types of library positions and the typical educational qualifications. It should be noted, however, that the profession would question the certainty with which some pronouncements are made, particularly in regard to library education curricula. Even on the requirement of a master's degree from a program accredited by the American Library Association (ALA) as a prerequisite to a professional career in librarianship, there no longer is total agreement.

Nevertheless, this discussion proceeds on the assumption that "Education for Library and Information Science," at least in the North American context, is generally understood to refer to master's degree programs accredited by the American Library Association (ALA), of which there are currently 50 in the United States and 7 in Canada (http://www.ala.org/ala/accreditation/lisdirb/lis_dir_2007-2008_re.pdf), and that "career" implies a professional level that rests on the accredited degree, or its equivalent. Since the late 1940s, the master's degree has been accepted as the basic qualification for a professional position as a librarian.^[1] "Library and Information Science" is typically shortened to LIS, and LIS education is understood to refer not only to programs that emphasize preparation for careers in library settings, but also for a broader range of information positions in industry and elsewhere. The latest *Library Journal* annual report on placements and salaries of 2006 LIS graduates states that 89.9% were placed in "some type of library agency." Employment outside of libraries, while still low, increased 37.4% over previous years.^[2]

The current LIS education landscape in North America is characterized briefly below. When speaking of professional qualifications it is useful to keep a few definitions in mind. A license to practice is issued by a government body, and should not be confused with certification, which

is recognition of an individual's qualifications granted by a professional organization. Accreditation, on the other hand, is given to an educational institution or program of study by an agency or professional association, based on the meeting of standards.

- A master's degree in library science (or library service or studies, or library and information science, etc.; usually designated as M.L.I.S. or M.L.S.) from a program accredited by the ALA is generally required for professional librarian positions in academic, government, and all but the smallest public libraries. According to the *Occupational Outlook Handbook*:

In addition to an M.L.S. degree, librarians in a special library, such as a law or corporate library, usually supplement their education with knowledge of the field in which they are specializing, sometimes earning a master's, doctoral, or professional degree in the subject. Areas of specialization include medicine, law, business, engineering, and the natural and social sciences. For example, a librarian working for a law firm may hold both library science and law degrees, while medical librarians should have a strong background in the sciences. In some jobs, knowledge of a foreign language is needed (<http://www.bls.gov/oco/ocos068.htm#empty>).

- Qualifications for school librarianship vary by state and are different in Canada. A master's degree in librarianship from a program accredited by the ALA or a master's degree with a specialty in school library media from an educational unit accredited by the National Council for the Accreditation of Teacher Education is held to be appropriate for U.S. school librarians. Many states also require school librarians to be licensed as teachers. Regulations for specific states may generally be found on their department of education Web sites.
- Most states and provinces have licensure requirements for public and/or school librarianship, generally based on educational credentials. At the municipal or county level, some U.S. governmental units may also apply Civil Service regulations for public library positions, usually involving examinations. In the case of small public libraries where staff is not required to hold the M.L.S. degree, some form of basic training may be mandated, usually under the auspices of the state library development agency.
- For other than school and small public library positions, most employers depend on ALA accreditation of the program where the candidate obtained the master's for assurance that the person has basic qualifications. ALA accreditation is based on standards first developed in 1951 and revised in 1972, 1992, and 2008. The ALA, in its turn, receives approval from the Council for Higher Education Accreditation. Standards

are designed to help programs to improve within parameters they themselves set. That is, each program declares its goals and objectives to suit its constituencies, and is judged on how well it achieves those goals and objectives. There is no single prescribed pattern that is expected or dictated by the Standards. Accreditation is granted by a committee of the ALA, based on self-studies and external review panel reports, for a period of up to 7 years. Standards are grouped under six headings: mission, goals, and objectives; curriculum; faculty; students; administration and financial support; and physical resources and facilities (http://www.ala.org/ala/educationcareers/education/accreditedprograms/standards/standards_2008.pdf).

- Curricula in ALA-accredited programs generally include courses on the organization of information, selection and acquisition of resources, assistance to users, application of relevant technologies, management, and what often are called "foundation" courses that deal with matters such as ethics, history, and service philosophy. Other offerings may include a range of courses on particular types of libraries, specific user groups, technical aspects of information technology, and evaluation and research methods.
- There has been a substantial shift in the delivery of M.L.I.S. programs from on-campus to the Internet. There is a consortium of schools, Web-based Information Science Education (WISE) that offer courses to each other's students on a space available basis (<http://www.wiseeducation.org>).
- Most programs strive to impart both theory and practical application, to introduce current issues and new technologies while continuing to cover the basics, and to allow for some level of specialization. Students are urged to get some practical experience prior to graduation, either through jobs, internships, or volunteer work.
- Most libraries prefer to hire M.L.I.S. graduates who have some experience and the specific skills required by the position to be filled. At the same time, there is an increasing interest in some institutions in hiring subject and technology experts who do not necessarily have an M.L.I.S.
- A large number of retirements were predicted some time ago, but it appears that there are not as many openings as anticipated. Some recent graduates are spending a long time searching for full time jobs, and are resorting to part time and temporary employment. This situation is especially likely to occur when the candidate limits the search to a specific location or particular preferred work environment.
- Descriptions of alternative careers (i.e., nonlibrary) for M.L.I.S. holders and advice on job searching are plentiful, both in print and online.

The above broad brush description of the current status of LIS education and employment of graduates in North

America masks the fact that technology for some time has been propelling change in libraries and concomitantly demanding new and different skills of librarians. It is difficult to tell how well recruitment into the profession, LIS education, job realignment, and hiring practices have responded to the changing scenario. There is evidence, however, that the profession has not been comfortable with the state of LIS education for some time.

CRITIQUES OF LIS EDUCATION FROM THE PROFESSION

There have always been complaints from librarians that educators pay too much attention to theory and not enough to practice, or conversely, that they teach technique to the neglect of theory and principles. The first formal program, launched at Columbia University by Melvil Dewey in 1886 was met with considerable suspicion, and the first graduate school to be established, by the University of Chicago in 1926, was not hailed as a necessary advancement in professional education.^[3] Primarily through the forum provided by the ALA, dialogue between practitioners and educators has continued over the years. Often the accreditation process has crystallized contentious issues, although external events, such as the increased demand for librarians after World War II, the Civil Rights and Great Society movements, and—more recently—the impact of computers and the Internet, also have stimulated discussion of the adequacy of LIS programs in producing graduates prepared to meet societal needs.

The strong postwar market for librarians, which spawned a dramatic increase in the number of accredited programs, came to a halt in the 1970s. From 1978 to 1994, 17 U.S. programs were closed.^[4] During that same period of retrenchment, more and more schools incorporated “information studies” or “information science” in their names and a noticeable number dropped the word library from the title. The closings, the incursion of information science (especially the hiring of faculty with doctorates in fields such as technology), the absorption of a number of independent programs into larger units in universities, and an increase in undergraduate majors in information created considerable anxiety about the direction of library education. One response was the first Congress on Professional Education (COPE), organized by ALA in 1999. Discussions revolved around the higher education context, core values, curriculum, and accreditation; a full report can be found at <http://www.ifla.org/VII/s23/bulletin/vol1-2.htm#4>. Two additional congresses were held, one on continuing education and the other on support staff. Some of the recommendations emanating from these meetings have been heeded, but it cannot be said that concerns have been laid to rest. Recently, an ALA presidential task force was appointed to consider the core curriculum, accreditation, and other contentious issues. A report is due in the summer of 2008.

Overlapping with the ALA congresses, a study of LIS education was carried out from 1998 to 2000, under the auspices of the Association for Library and Information Science Education (ALISE). Funded by the Kellogg Foundation, the project is known as Kellogg-ALISE Information Professions and Education Reform (KALIPER).^[5] The project identified trends that confirmed critics’ fears that LIS education was shifting attention and resources toward information as a major focus, but the researchers presented this finding in a positive light. At the same time, they reported that the traditional course content was still being offered, although compressed and not necessarily identified as a mandated core.

The most notable recent critique was spearheaded by Michael Gorman, 2005–2006 ALA President and Dean of Library Services at California State University-Fresno. He gave a keynote address at a conference of the European Association for Library and Information Education and Research (EUCLID) in 2003, the general thrust of which he repeated in other papers and speeches in the following years. The abstract from the EUCLID proceedings captures much of the continuing debate, and is therefore quoted at length:

This paper advances the idea that there is a crisis in library education. . . Among the problems seen are that library schools have become hosts to information science and information studies faculty and curricula. . . peripheral to professional library work. . . Many of the topics regarded as central to a library education by would-be employers are no longer central to, or even required by, today’s LIS curricula. Modern communications technology has led many library educators to concentrate on that technology and to dismiss anything about libraries that is not amenable to a technological solution. The gap between what is taught in many LIS schools and what is being practiced in libraries is wide and widening.^[6]

Gorman goes on to raise a number of other issues, such as the impending retirement of many librarians, the uneven geographical distribution of LIS programs across the United States, the loss of a number of prestigious library schools and the resulting “diminution of the research (in quality if not quantity) into library topics.” Gorman wants to see a required core curriculum taught in every school that reflects what goes on in libraries: collection development and acquisitions, cataloging, reference and library instruction, systems, management, and types of libraries. He claims not to understand why the accreditation process cannot assure this.

CRITIQUE OF LIS EDUCATION FROM WITHIN

While the KALIPER project concluded with a considerable amount of self-satisfaction, not all LIS educators are sanguine in the face of the changes of the last decades.

Expansion of course offerings with a focus on information technology and information science has made it more difficult to allow for concentration in medical, law, youth, and other specialized areas of librarianship. Courses such as the history of libraries and librarianship, reading, and outreach to underserved populations are not generally available. Florida State professor Wayne Wiegand, for example, makes a strong case for including reading studies and library-as-place in the curriculum.^[7,8] LIS educators are in agreement that they have failed to recruit students who reflect the population at large, have difficulty attracting minorities to the professoriate, and are not producing enough Ph.Ds. to replace the many faculty who will soon be retiring. Some even echo a number of Gorman's criticisms about curriculum and priorities.^[9,10] There is some unease about the rapidly increasing conversion of face-to-face courses to the online delivery mode. With few exceptions, master's degree programs are too short to prepare graduates who are as well qualified for today's complex library and information jobs as faculty would like. But the fear is that increasing the length of programs would cut into enrollments and therefore threaten program viability in cost-conscious higher education institutions.

IN RESPONSE TO THE CRITICS

The most serious criticism of the late 1990s concerned the perceived demise of the traditional core curriculum and the failure of the ALA's accreditation process to assure the profession that graduates of LIS master's programs are well prepared. The ALA's Office for Accreditation has acted upon the COPE I recommendation that it do a better job of preparing external review panels, by conducting training sessions in conjunction with ALISE and ALA conferences. The ALA's Committee on Accreditation (COA) has been increasingly rigorous in its reviews, and has continuously revised policies and procedures. The Office's Assistant Director, Renee McKinney, recently compared the ALA's 2005 draft of core competencies to the curricula of the LIS programs, and found that 94.6% had courses that included all of the eight that were identified in the draft (<http://www.ala.org/ala/accreditation/prp/prismreports.cfm>).

An earlier study by Karen Markey also identified five core courses, one each in organization, reference, foundations, and management, and one in either research or information technology. She concludes, "The curriculum remains strong in traditional coursework that seeks greater understanding of users, their information-seeking behavior, and the sources and services that libraries provide to users generally and to special populations."^[11] On the other hand, a 2006 content analysis of curricula found that there was a large number of elective courses, while the number of required courses was as low as two. The

four types of courses offered most frequently were organization of information, reference, introduction, and management.^[12]

In response to the fusillade delivered by Michael Gorman, almost the entire Fall 2005 issue of the *Journal of Education for Library and Information Science* was devoted to articles addressing his complaints. The most pointed is the paper by Carla Stoffle and Kim Leeder.^[13] Stoffle, as an academic library director with experience as a student of higher education, acting director of a library school, and member of ALA's Committee on Accreditation, takes a holistic view of the "crisis." Her main conclusion is that

many practitioners do not understand the goals of library education, the demands under which these programs operate, or the standards to which they are held. Practitioners want to dictate a curriculum based on their interests or the hiring needs of their particular libraries, without acknowledging the tremendous range of subject matter that these schools must address in only 36 to 42 hours of coursework.^[13]

OTHER PERSPECTIVES ON THE M.L.I.S.

Research libraries tend to be less concerned with the core curriculum than with qualifications that LIS graduates have obtained elsewhere during their education. Their stance is that foreign languages, area studies, and other specialized subject backgrounds are needed in research libraries, and that few M.L.I.S. holders have the necessary academic background. The Council on Library and Information Resources funds a postdoctoral fellowship at four libraries as a means of recruiting scholars to library work, bypassing the M.L.I.S. With a similar goal in mind, Yale offers a paid internship to Ph.D. students who have completed course work.

Other specialized LIS professional associations also have concerns about the products of ALA-accredited schools, and like to be involved in events such as the COPE series and to be represented on LIS schools' advisory bodies. They contribute by defining the competencies that their specialties require, providing internships, and teaching as adjuncts in LIS schools. The Special Libraries Association's (SLA) competencies document is frequently cited as a model (<http://www.sla.org/content/learn/comp2003/index.cfm>). It is divided into professional and personal competencies, with detailed descriptions of specific skills, and scenarios illustrating the application of professional competencies. The four major professional competencies which provide the framework for the skills lists are managing information organizations, managing information resources, managing information services, and applying information tools and technologies. While these skills are taught in LIS

education programs, SLA does not have a policy that states that the M.L.I.S. is the appropriate preparation for a career in special librarianship. Instead, the last policy statement (1992) on education expresses concern that many LIS programs do not provide an adequate range of courses. The full statement is not accessible electronically, and is probably seen as no longer necessary now that the competency document exists.

The Medical Library Association (MLA), through its Academy of Health Information Professionals, provides a credentialing system for librarians who can demonstrate that they have attained specific levels of education, experience, and professional achievement. An M.L.I.S. from an ALA-accredited program is suggested as the basic academic preparation, but an equivalent graduate degree is acceptable. The American Association of Law Libraries (AALL), like the MLA, lays out a list of competencies which “may be acquired through higher education such as library and information science programs, through continuing education, and through experience” (<http://www.aall.org/prodev/competencies.asp>). It is fair to conclude that for many kinds of special librarianship, the M.L.I.S. from a program accredited by ALA is merely one option for meeting entry level qualifications. SLA, MLA, and AALL all place great emphasis on the importance of continuing education and professional development.

MORE ON COMPETENCIES

In the curriculum section, the 1992 accreditation standards call for taking into account competency statements promulgated by professional associations devoted to the various specializations. At the time, few such statements existed, but since then the gap has been largely closed. As previously mentioned, the ALA developed a generalized draft in 2005. The Canadian Library Association has a somewhat whimsical all-purpose list, divided into personal and professional competencies (<http://www.cla.ca/infonation/skills.htm>). Some of the ALA divisions devoted to types of librarianship have their own specific statements, as do a number of the nonaffiliated specialized library/information professional associations. LIS educators are expected to be familiar with those that are relevant to the courses that they design. It must be recognized, however, that the term “competency” as used in these professional pronouncements does not mean what it does when it is used by specialists who apply sophisticated measurement tools to the determination of competencies. The lists produced by LIS professionals are more like best practices descriptions, and simply represent the consensus of a group of practitioners about the ideal behavior and performance of their peers.

LIS EDUCATION IN THE INTERNATIONAL ARENA

The International Federation of Library Associations and Institutions (IFLA) is one of the best sources of information about LIS education globally. A new edition of *World Guide to Library, Archive, and Information Science Education* was scheduled for publication in late 2007. The intention is to list professional education and university level training programs worldwide. Meanwhile, there is an online directory compiled by T. D. Wilson at <http://informationr.net/wl/>.

IFLA approved *Guidelines for Professional Library/Information Education* in 2000 (<http://www.ifla.org/VII/s23/bulletin/guidelines.htm>). The introduction states that while LIS education occurs at differing levels—technical, graduate and professional, and research and doctoral—the guidelines apply mainly to the graduate and professional level. It is recommended that programs should be part of a degree-granting institution at the tertiary (university) level. Recommendations are grouped under headings similar to those used in the ALA’s standards: curriculum, faculty, students, administration and financial support, and instructional resources and facilities.

In addition to IFLA publications, there are a number of English language publications that are regular sources of information about LIS education in various countries of the world, especially the journals *Education for Information*, *Journal of Education for Library and Information Science*, and *Libri*. In addition to ALISE and EUCLID, there are units in IFLA devoted to education and research. ALA conferences regularly attract LIS educators from abroad, and a wide array of international conferences also enable interaction among faculty from across the globe.

Perhaps the most significant development in LIS education at the international level was stimulated by the Bologna declaration in 1999, which calls for European countries to make their higher education programs more comparable and to initiate quality assurance efforts. For LIS, the likely outcome is that European preparation for library careers will look much more like that of the Anglo-American and some Asian countries. Eventually, it may be possible to tell whether librarians educated in one country have qualifications equivalent to those of another in which they want to work. Currently, it is difficult for employers in the United States, for example, to hire individuals who have received their training abroad. ALA states, however,

The master’s degree from a program accredited by the American Library Association (or from a master’s level program in library and information studies accredited or recognized by the appropriate national body of another country) is the appropriate professional degree for librarians

(<http://www.ala.org/ala/educationcareers/employment/foreigncredentialing/index.cfm>).

CAREERS

The ALA's Office on Human Resource Development and Recruitment has general information on careers (<http://www.librarycareers.org>). For a more wide ranging and current snapshot of the profession, see <http://www.liscareer.com>, which not only collects advice on career planning and job hunting, but has a list of links to a variety of job postings. A spate of books on careers in LIS has been published, reflecting not only the concern with recruitment, but also raising awareness of alternative career paths. Since the first edition of Betty-Carol Sellen's *What Else You Can Do with a Library Degree* in 1980, there have been numerous suggestions of nontraditional jobs that benefit from the knowledge and skills acquired through LIS education. Recent examples of books with sections on alternate careers are listed at the end of this entry. The contributors to the book edited by Shontz and Murray tell how they gained the specific knowledge and skills that their jobs require, which often are not in the domain of LIS education programs. Many of them also explain how they stay up to date and continue their professional development.

The best way to learn about specific requirements for positions is to read job announcements regularly. Even if educational preparation is not mentioned explicitly, one should be able to relate the stated qualifications to the kinds of courses and training that provide the background. Learning about what employers are looking for also gives one a sense of how the field is changing, and is one way for LIS educators to see where curricula need to be adjusted. The following are excerpts from recent announcements that illustrate the range of jobs and differing requirements. Not all require an ALA-accredited M.L.I.S., and most want individuals with the kinds of personal characteristics and talents that are inherent rather than learned in a professional degree program.

Categorization Analyst

- Understanding of linguistic ambiguity and a creative approach to problem-solving.
- A background in Linguistics, Library Science, Information Sciences, or related field is preferred.
- Must have a B.A./B.S. with 1+ years of experience, or an M.L.S./M.L.I.S./M.S.
- Excellent communication and organizational skills.

We are an innovative technology company in the business of structuring and organizing massive amounts of unstructured content.

Digital Services Librarian (Assistant Professor)

- Will collaborate with library faculty and the Dean's office in developing and producing digital projects, in

providing information services for students taking Web-based courses, and in the development of other Web-based applications.

- Will research, evaluate, test and recommend methods, standards, and software used in the creation of digital collections and their preservation; maintain best practice documentation for digital efforts; provide expertise to others in the creation of digital collections; and participate in grant-writing and training initiatives.
- Will collaborate with library faculty in providing reference service to distance education students and in developing tutorials and other Web-based services for off-campus and on-campus students.
- Will be expected to teach some information literacy courses and perform other duties as assigned.
- Required qualifications: Demonstrated digital project management skills; working knowledge of digital library technologies, standards, issues, and trends; ability to interact effectively with a broad range of employees within the Library, the University and in collaborative initiatives with other institutions; excellent written and oral communication skills; M.L.S. from an ALA-accredited program; a second master's degree or doctorate is required for tenure; excellent communication and interpersonal skills; demonstrated ability to work in a collegial environment.
- Desired qualifications: Demonstrated knowledge of digital conversion of materials; experience with MACHiNE Readable Cataloging (MARC) and Dublin Core; comprehension of relevant Internet delivery technologies for digital content; successful grant-writing activity.

Knowledge Systems Librarian/Taxonomist, Law

- Combination of knowledge and experience at the intersection of knowledge management (KM), law, and technology. . . . Must be able to interact effectively with attorneys and staff worldwide.
- KM Systems Librarian will maintain the quality of search results and contents and establish workflow procedures for vetting documents. Oversee workflow, reinforce and monitor data inclusion and indexing, and establish and maintain effective working relationships with all legal support departments firm wide. Develop and maintain taxonomies; both firm, office and practice group; and be able to integrate multiple language schemes. Work with Head of Technical Services to leverage Library Automation software and expand installations globally.
- Requirements: M.L.S. and/or JD (law degree) with proven expertise in building taxonomies. Must have solid IT skills including maintaining quality databases and an ability to troubleshoot difficulties with end user search and document indexing. . . . Working knowledge of European languages would be a distinct advantage.

Staff Training and Development Coordinator

- Work collaboratively with multiple constituents including Department Heads, managers, supervisors, and library staff members to design, develop, coordinate, market, and implement training and development programs that speak to the diverse needs of the staff.
- Track staff participation in training programs. . . assess effectiveness.
- Lead Library Education and Training Committee; run Library's New Employee Orientation program.
- Work with University resources (i.e., University Human Resources, the Ombudsman, EEO (Equal Employment Opportunity), Employee Health and Safety, and external organizations (i.e., PALINET, the Association of Research Libraries) to achieve results.
- Maintain and update the Library HR Web site.
- Required: Bachelor's degree required. A minimum of 5 years of previous experience as a training professional in an academic library or higher education setting required. Demonstrated ability to work effectively with a variety of people at all levels in the organization. Must have superior oral and written communication skills. Previous supervisory experience required.
- Preferred: Prior experience working with diversity programs and initiatives preferred. Master's degree in Human Resource Management, Organizational Development, or Adult Education preferred.
- Desirable: Certification as a HR Professional.

Principal Librarian to Lead the Youth Services Team

- Serve an extremely active and diverse community in an urban setting. The Youth Services Department Head supervises a staff of seven, including three full-time librarians. This position will also serve as a member of the Branch Management Team; designing branch services, developing branch objectives and activities, and recommending branch procedures. The ideal candidate will demonstrate enthusiasm; excellent organization and communication skills; the ability to lead a team and work as part of a team; a collaborative and inspiring disposition; strong desire to work with and within a diverse community; and demonstrated excellence in cross cultural competencies. Evenings and weekends are required with this 35 hr per week position.
- Requirements: A master's degree in Library or Information Science in a library program from a library school accredited by the State Board of Education. Two years of professional librarian experience.

Although the positions in the above examples are from a U.S. Northeast metropolitan area, they are not especially unusual, and do reflect today's LIS environment. The

Canadian Library Association' Web site has a page with hypothetical job descriptions, intended to give an idea of the range of positions and qualifications: <http://www.cla.ca/infonation/jobstuff.htm>.

Referring again to the excerpts from the above postings, it seems that technology expertise may not always trump management and people skills. Employers complain that LIS education gives short shrift to management, but most students resist taking courses in that area. LIS education program admissions decisions rest primarily on evidence that an individual is likely to succeed in graduate study. Admissions committees (or officers) cannot reject an otherwise well-qualified applicant merely because the applicant's motivation is confined to a lifelong love of books. The dissatisfaction that employers express with LIS curricula could at least in part be redirected to recruitment into the profession. It is well documented that most persons who decide to enter librarianship do so because they have worked in a library at some point and/or been encouraged by someone already in the field. The profession, therefore, tends toward replication rather than transformation.

CONTINUING EDUCATION

Referring again to the position announcement excerpts above, it becomes clear that very diverse skills and experience are needed across the spectrum of library/information careers, and that obtaining an M.L.I.S. may be only one step toward achieving career objectives. Other formal degree programs may actually be preferred, as in the case of the university library staff development position. All library/information personnel, however, need to participate in some form of ongoing learning, in response to continually changing technology, increasing client expectations, and pressure for accountability. Where the learning takes place can range from university classrooms, to professional conferences, to the workplace, to one's PC at home. A need may be met through offerings from a continuing education provider, workplace training, or by self-directed, informal learning.

Most LIS education programs are willing to have alumni return for additional courses as the need arises, and a few offer sixth year certificates. Some have professional development programs which range from occasional workshops, to series of webinars, to online credit-bearing courses, study tours, and other formats. Large library systems tend to have their own in-house professional development programs. There are regional consortia that play important roles in providing continuing education, and many vendors offer in-house training. The many LIS professional associations provide an increasingly diverse menu of learning opportunities, going well beyond the traditional publications and conference programs of the past. Many now regularly offer online

courses, and just about all have electronic discussion lists, podcasts, newsfeeds, and blogs that encourage members to share expertise. WebJunction is a portal and clearinghouse of professional development opportunities, which makes it possible to locate a resource to meet a learning need at the moment that it is required (<http://www.webjunction.org>).

For some specialized areas, there are annual institutes and symposia designed to impart the latest and best practices, such as the Northeast Document Conservation Center's School for Scanning and the University of Maryland's copyright symposia. There are too many leadership development institutes to list, and several annual conferences on information literacy. Internationally, a key provider is IFLA, which holds not only an annual conference with its numerous satellite events, but also has quite a few separate programs throughout the year in different parts of the world. IFLA has a section on Continuing Professional Development and Workplace Learning (CPDWL), which has developed guidelines for quality continuing education (<http://www.ifla.org/VII/s43/pub/cpdwl-qual-guide.pdf>), available in a number of languages. CPDWL has held seven conferences with published proceedings and is in the process of preparing a theme issue of *Library Management* devoted to professional development.

A recent addition to the array of professional development opportunities is the Certified Library Administrator program offered by the ALA's Allied Professional Association (APA). It is currently aimed at public library directors and is an effort to make up for the lack of management education so common among LIS graduates. Nine courses are available, of which four are required: Budget and Finance, Management of Technology, Organization and Personnel Administration, and Planning and Management of Buildings. The electives are: Current Issues, Marketing, Fundraising/Grantsmanship, Politics and Networking, and Serving Diverse Populations. The APA's Web site tracks the progress of individuals seeking certification—not many at this stage, but increasing (<http://www.ala-apa.org/>).

CONCLUSION

Is there a crisis in LIS education? Is there going to be a shortage of library/information professionals as more librarians retire? Or, will there be fewer entry level jobs for LIS graduates as more work is passed to nondegreed staff? Will the profession succeed in diversifying its ranks to better reflect changing demographics? Will LIS educators and employers reach a better understanding of each other? Can they agree on what a core curriculum should contain? Will the accreditation process remain much as it is now, or evolve in a new direction? Will the current 31 Ph.D. programs in LIS produce a new generation of

faculty members who are well suited to teaching and conducting research in the constantly shifting higher education environment? With 18 undergraduate, as well as Ph.D. and other master's programs sharing resources with M.L.I. S. programs, many of which are increasingly using labor-intensive online delivery, will quality be maintained? Many of these questions are not new, but recur over the years. Finding answers seems to be more critical today, as LIS education programs are challenged to survive criticism from within and without.

Careers and Education in Records and Information Management

Carol E. B. Choksy

School of Library and Information Science, Indiana University, Bloomington, Indiana, U.S.A.

Abstract

Careers in records management vary by organization and industry. There have been few educational-resources available other than ARMA conferences and meeting. While the career itself is interesting and challenging, the role of the records manager within organizations is often poorly understood or appreciated.

INTRODUCTION

Every type and size of organization needs records management. From the entrepreneur to the multinational, from government to nonprofit and NGOs, and from the accounting firm to the technology company, every organization needs to perform records management to find information again, to safeguard intellectual property, to comply with regulations, to be transparent, to lower costs, to serve customers better, and to respond to litigation, among other issues. The leaders of most organizations do not always understand the need for records management unless there are scandals like the British intelligence report on Iraq before the war began that nearly took down Tony Blair's government, seeing paper spread far and wide in the World Trade Center collapse, or hearing about a \$1.5 billion court fine against Morgan Stanley—in *Morgan Stanley v. Coleman*—for not being able to find e-mail backup tapes. Until recently, most leaders responded to these perceived risks with a hasty band-aid such as a change in procedures, a disaster recovery program, or a retention schedule. The number and severity of the scandals, from Bill Gates's e-mail in Microsoft's antitrust trial, to the deleted e-mails that brought down Arthur Andersen, from the large fines placed on broker-dealers for not managing their e-mail, to the \$38 million settlement in *UBS Warburg v. Zubulake* for not handing over e-mails for which the plaintiff had clear evidence, has convinced more leaders, mostly for-profit, that they need to have a complete program. Those same leaders are now seeking records managers with education and skills to run enterprise-wide programs that are now reporting to executives in accounting, legal, and information technology. This is in sharp contrast to a decade ago when records managers reported to a director of facilities and managed boxes in off-site storage and a few records rooms.

From late 1990s to now, executives and directors managing every type and size of organization in North

America have placed an increasing value on records management for finding information again for operations, disaster recovery and business continuity, and litigation response. Within those organizations generally there has also been recognition that the information technology products including, hardware, operating systems, and applications, purchased throughout the 1980s and 1990s to create, distribute, and store information actually do a poor job managing information by themselves. This increased value of records management and recognition of the current information technology situation has led to a higher value place on records managers, particularly those with the CRM (Certified Records Manager) designation. That dearth of qualified records managers has created an opportunity for professions, such as lawyers, to create retention schedules, and records management policies and procedures. This dearth has even created opportunities for library and information science to create and sell standardized taxonomies as the basis for a records retention schedule. Information technology vendors including Microsoft, Computer Associates, and EMC have created products to manage information on top of the other products these companies sell. Trade associations such as SNIA (Storage Networking Industry Association) and AIIM (Association of Imaging and Information Management, formerly the microfilm industry association) have created alliances or tried to merge with the association representing records managers, ARMA, International. These opportunistic services, products, and relationships have met with varying degrees of success depending upon the source's understanding of how complex the business objects in the records manager's portfolio are—as opposed to the cultural objects managed and studied by library science, archives, and information science. Until recently, those business objects were managed only by records managers, and were studied by the rare records manager with time for reflection.

RECORDS MANAGEMENT ASSOCIATED WITH RISK

The existence of the post of records manager, a records management program, and a perceived need for a records management consultant are currently based on the risk side of records management where in policies are inadequate, procedures are lacking, information technology that did not manage records was implemented *en masse*, and the employees created messes because they thought they “know technology” or that the technology was designed to manage information. The same activities that will correct these problems can, if understood by the creator, help the organization create a more secure computing environment, manage output, and aggregate information for innovation. If the creator does not understand these problems, the organization may get a set of groups of documents and the regulations that restrain their life. The education of the creator is key to the success or failure of the organization’s program. The selection of the creator is, however, entirely in the hands of employees who do not understand records management either, hence the hiring of preformed taxonomists and attorneys to create retention schedules. Other organizations seek out persons with experience and qualifications. More and more organizations are seeking out an individual with a CRM to perform all of the tasks to create and run a records management program.

DIVERSITY OF THE ROLE

Employees who perform records management are diverse. Any person who is responsible for managing some aspect of the life cycle of documents, records, content, or information inside an organization is performing records management. Thus, the mailroom supervisor who is capturing documents in the mailroom and the information technology (IT) director who sets the retention of e-mail in the personal mail boxes of end users to 30 days are managing records. Managing records does not mean managing only what ultimately get placed on a retention schedule, it means also ensuring that documents, content, and information that should not get placed on the retention schedule is managed (in this case, meaning formed properly and disposed of promptly).

What this means is that the titles for records managers are quite diverse. When ignorance of the existence of records management as a profession is added to that diversity, calling any organization and asking for “the records manager” can lead to some amusing circumstances. For example, in performing research for a project on organizational management and electronic records management the author made more than 150 calls to Fortune 500 and Forbes 300 companies, to identify the records manager for the study. At one Forbes 300 company the receptionist said she had worked for the company for more than

30 years and no one had ever asked that question. Only one call out of more than 150 produced the name of a person who was responsible for records management, but did not belong to ARMA.^[1] (As a result of this experience, I used the ARMA member list to enroll members.) At the same time, persons who are responsible for early phases of the records life cycle, particularly those who perform information capture through scanning documents may not identify themselves as records managers because of trade advertising and analysts that cast records managers and records management in a pejorative light. This author has interviewed employees at some of the largest Fortune 500 firms that performed records management through several phases of the life cycle, including both imaging and box storage, yet those employees eschewed the title “records manager” as some how lessening what they do. Some trade association publications characterize records managers as roadblocks to successful document management implementations. In an article, Steven Good fellow, the president of Access Systems, which is a records management consultancy, writes: “When the records manager is brought into the discussion, it may be viewed as an effort to stir up more dust thus clouding the solution seen by the department and/or IT. . . because they can’t speak in IT terms.”^[2] (This, of course, begs the question whether “IT” is a *lingua franca* or whether those who speak “IT” should learn to speak in the language of the employees of the organizations in which they are working.) This is a fairly typical characterization of a records manager and reflects the trade association’s need to portray the solution as requiring a “tool” rather than a practice or skill set. Underlying this is the problem that the “tools,” the electronic document management systems (EDMSs) and the content management systems (CMSs), are designed to solve a tactical departmental problem where as the practice of records management is focused on information management not only throughout the lifecycle of information, but also on an enterprise-wide basis. The perspectives are thus that of 10 ft off the ground versus the 50,000-ft level. The two perspectives are not incompatible; documents, whether electronic or hard copy, must be corralled into a repository to be branded and subsequently managed. Unfortunately, the products that corral the documents manage only a tiny portion of the life cycle and often are created without the ability to “preserve” documents either in a litigation or archives sense. In addition, the policies and procedures to manage documents beyond a very narrow definition of the capture phase, such as associating a document with a retention classification are also missing.

IT AND RM

This wound of tools managing one small portion of the life cycle versus the practice of managing the entire life cycle

that has existed for about 15 years is gradually healing as information technology loses its caché and as the companies that create the applications, such as Microsoft and IBM “discover” they have actually created problems that threaten the existence or at least the credibility of many organizations because of a failure to include the family planning to death certificate and document classification practices of records management. (For example, Arthur Andersen collapsed due to a lack of credibility because of the destruction and subsequent resurrection of e-mails. See Glater.^[3]) This has not yet brought together all records management practitioners into one, big, happy family yet, as the article quoted above indicates. Records management is considered by most of the application companies to be an application that manages documents after the documents have been “declared a record.” This relegation to less interesting phases of the life cycle has continued, so that some content management application companies have differentiated “retention management” from “records management,” where in retention management is differentiating ephemeral documents—and the purging of those documents—from those documents that would need to be kept for a long period of time. Thus, software applications companies understand the practice of records management as being the management of boxes of paper documents and electronic “records,” using the archivists’ understanding of a record as something that has passed beyond its active context to become “evidence” only.

The actual portfolio of activities performed by records managers is quite varied, so varied in fact, that it is difficult to describe what all records managers do other than to say we manage the life cycle of records through the employment of policies and procedures, classification systems, risk management, legal and business requirements, and the discovery phase of litigation management. What records managers understand as the life cycle of records includes everything from the family planning phase through a death certificate. The concept of “cradle to grave” management as espoused currently by the document and content management application companies is partly what led to jury penalties as high as \$38 million being applied when companies cannot pull out documents that should not have been created in the first place and that, in some instances, were deleted but resurrected because the document had not been properly destroyed. The planning phase includes creating policies, such as to whom information and the systems to create information ultimately belongs, procedures, such as ensuring that every document gets placed in an appropriate folder and does not float for eternity in the “Inbox” of an employee. The planning phase also includes a system of governance including a governance committee with enough authority to adjudicate issues, an audit program so that the organization knows whether employees are complying, a system of enforcement such as penalties for noncompliance and threats of law suit for egregious breach of policies and

procedures, and a training program that goes beyond using a software application to include why the records management program exists.

The creation phase can include everything from managing a mailroom and an imaging application there, to creating procedures to ensure the organization has draft, version, and copy or output control, to approving the purchase or intended use of a document, content, or records management application. Creation also includes limiting the content that can be placed in a document through e-mail etiquette and policies that forbid content such as pornography. No phase is hermetically sealed from other phases having created policies and procedures and introduced tools for one phase, the effects from all previous phases are felt throughout all subsequent phases. Organizations learning this currently through litigation say they are “dodging bullets” (personal conversation with general counsel of a multinational corporation) because they cannot find what they need to respond to subpoenas. Knowledge of how to write effective policies and procedures as well as how to provide training and change management are essential for implementing this phase.

RM AND LITIGATION

This leads to the question of what the records manager actually manages. There is neither “litigation phase” nor is there a limitation on what phase litigation can hit. Because of this threat, records managers now must address the management of any information captured within the organization whether that be photographs of employees dogs, internal e-mails that harass other employees, Internet caches that indicate what Web sites employees visited, in addition to those documents for which statutes, regulations, and agency bulletins as well as industry best practices and knowledge management needs. What the records manager actually manages bears little resemblance to ISO 15489 and the published definitions of archivists. Records managers are beholden to the definitions enunciated in law and the requirements of litigation—not the definitions of academic archivists. This extreme description of the “record” resembles nothing as closely as it does the current Euro-American studies of the “document” being performed by The Document Academy.^[4] I have managed chunks of concrete, tools for making corporate seals, and have advised on how to track property owned by the U.S. federal government to be used in prototype engines. Unlike inventory management and supply chain management where every token of a type is managed like every other token of a type, records management requires managing processes where every token becomes its own type, can be extracted from any business process, and brought into a business process addressing litigation.

This activity requires knowledge of each business process within the organization and what purpose those

business processes perform. This also includes understanding how and why employee create and use them. Knowledge of the method of capture or creation of nearly every document involved in those business processes is required in order to ensure adequate document controls and metadata are attached to each set of documents. Control to the level of whether, for example, comments are made on documents, whether Post-It® notes, comments, or red-lines may remain attached when the document becomes idle, or whether attachments must be stripped from e-mail when filed. Another term currently used for “document control” is “document management.” Document management is the phrase used to describe what activities are performed by information technology applications: EDMs and CMS. Imaging applications do not perform document control; they create a new copy of a document in another medium. While the companies that create these products would like to claim these products do not perform records management, the activities of document control are part of the early twentieth century historical foundation for records management.

RM AND DOCUMENT OR CONTENT MANAGEMENT

Document control is the practice of ensuring the “record” is created properly using various methods of management control. It may take decades to create the “record,” such as an engineering file documenting the creation of the Hoover Dam or a patient file documenting all services provided to a medical patient. The “record” may document an entire process like the creation of a single, complex document, or many different processes as with the example of the patient file. Many different skills are required to ensure appropriate controls are applied. Those skills, some of which are noted in the examples above, may require ethnographic skills to determine how the organization differentiates activities, analytical skills to determine what metadata are appropriate and what are not, managerial skills to manage change, and negotiation with upper-level executives to obtain appropriate funding for projects to implement document controls. For example, the author regularly interviews attorneys in law firms to uncover the logic of how they do their work and then negotiates with the same attorneys to help them create their own standardized list of “document types” and submatters (activities like environmental reviews for real estate deals). This requires knowledge of the technologies being used by the lawfirm, how they are implemented, and how to discuss what the attorneys do with administrators, including directors of IT, who believe the attorneys’ filing activities are either chaotic or so disparate that there can be no standardization. The records manager must also have an in-depth knowledge of security and privacy, litigation

facing the particular organization, quality controls, as well as how the organization views risk management.

Another aspect of this broader definition of “records” is the requirement of having detailed knowledge of the special content of each type of document. One university was astonished to discover the records manager knew where all the personally identifiable information was kept throughout the university and could recite the information from memory without having performed an expensive and time-consuming study. (Personal conversation with records manager of major state university.) Having worked with the documents and given extensive advice on all the university’s processes for so many years and with the disparate dimensions required of any records manager, this is surprising only to the nonrecords manager. Even records managers whose portfolio includes only boxes or tapes in storage will have extensive knowledge of the locations of different types of documents and requirements for managing those documents appropriately throughout the end of the lifecycle.

Knowledge of the varying simultaneous dimensions required to manage documents is often confusing even to employees managing the documents, while quite natural to the records manager. The most important dimension of documents within records management is Retrievalability. Documents, with the exception of the ejaculations of e-mail (which has its own set of problems), are rarely created and sent in one continuous action. Documents, even e-mails at times, are passed around, edited, approved, redrafted, abandoned, and picked up again. Being able to find the documents again is crucial to the smooth flow of business. After documents have been completed and “filed,” finding the document again can become a challenge, particularly if the person who “filed” the document is no longer with the department or even the organization. When there is a time limit on the time required to retrieve (and prepare and review) the document again, e.g., 30 days for a litigation subpoena, and there are thousands of such documents, an organization can find itself in dire straits with whom so ever needs or requires the documents. Precisely this situation held in *Morgan Stanley v. Coleman* where in Morgan Stanley kept finding more e-mail backup tapes and reporting them past the discovery phase of the trial. The judge was so exasperated with Morgan Stanley that he added a fine to the punitive damages that totaled nearly \$1.5 billion. This was subsequently reversed by a higher court, but not because of the amount of the fine. (The jury instructions were considered in appropriately framed. Again, this had nothing to do with the total damages.)

The next dimension in importance in records management is Accessibility. This dimension has a number of different components including speed of access, security, and privacy. Documents may be accessible, but getting hold of a specific document may take several days, many man-hours, and specialized equipment and software. Backup tapes are accessible, but depending upon the

number of tapes, how the tapes were created, and what is required, finding the specific document among thousands of backups can be a struggle. In the Morgan Stanley case, documents were accessible, but could not be retrieved and restored quickly enough to respond to the subpoena. The newly revised rules of evidence do not compel the production of new types of information.^[5] By using the term “electronically stored information” rather than “electronic documents,” “electronic records,” “electronic content,” “databases,” etc. the federal judiciary hoped to clarify what had been interpreted poorly by responsive organizations. Records managers are now beginning to be given responsibility for part of the production of electronically stored information and are working along side general counsel and information technology to create better environments for finding information again.

RM TITLES

The actual title “records manager” has usually made reference to “records,” “information,” or “documents.” Rather than appending “manager” to that, more and more organizations are raising their responsibility set of these employees by making them directors and vice presidents. Sometimes the title is “assistant deputy counsel” because the person has a law degree. In multinational corporations many records managers are the global directors of records and information management. Larger organizations may have more than one records manager with duties divided according to expertise. For example, one may be an executive in charge of the entire program with responsibilities for strategy and liaising with other departments, while another with extensive records retention experience may create an organization-wide retention schedule, yet another will have had experience in imaging or microfilm and be responsible for capture and long-term storage of documents. Research indicates that records managers work closely with legal, IT, and line-of-business managers both as an advisor and as a requestor of information. Far from being locked in a basement with boxes, records managers are now part of robust organizational networks.^[1]

RM EDUCATION

Until the past few years, records management was offered primarily as a community college course. Those courses were offered by practitioners with everything from a high school degree to a professional master’s degree to a doctoral degree. Course offerings would arise with the interests of an individual practitioner in association with a college or university and often ended with that practitioner’s absence. A college course or two would arise as the result of the efforts of a faculty member, but would also wane with the absence of that faculty member. There have been a few

baccalaureate degrees and minors offered, most notably at the College of Business and Public Administration at the University of North Dakota and the School of Information Science at the University of Tennessee at Knoxville. There was little effort put forth in creating an enduring program in part because the same faculty member could make additional monies through writing, consulting, and offering seminars. In other words, cooperation among faculty at different universities in creating a standardized course of study was not rewarded monetarily. Holding knowledge closely rewarded records management faculty monetarily. Faculty who did see themselves creating a course of study were few and created those courses at the baccalaureate level. However, as those faculty members’ careers waned, so did their programs—the same as at the community college level. In addition to this, the school in which records management was taught differed greatly in focus. At the University of North Dakota, records management is taught in the context of business. At the University of Tennessee, records management is taught in the context of library and information science. An occasional dissertation would appear on records management, but no graduate positions created. When records management was taught at the graduate level, it was taught in the context of a library and information science school, usually by an archivist. Some programs have begun offering certificates in records management in MLS (Master of Library Science) courses of study, essentially a minor in records management.

On a different front, the professional association for records managers, ARMA, International, did not have staff who understood enough about university education, like the need for recognition of the profession by deans, not just individual faculty, like the need for there to be a ready market for records management graduates, like companies recruiting for records management graduates on campus and a clear research agenda for the field, to have any impact on records management education. Yet most people who count themselves as records managers, both in the public (52%) and private (64%) sectors got their education in that field from ARMA.^[6]

Because no standardized course of graduate study arose, text books are all aimed at a very practical “how-to” level. Because university faculty, particularly graduate faculty, did not have practical experience and, until recently, the practitioners were primarily high school graduates, textbooks could not graduate much beyond a community college level. The content of textbooks in records management range from how to file^[7] to how to manage a file room.^[8–11] The very best textbook, best because of its scope, quality, and relevance to the field is the work of Robek et al.^[12] (Similar but not as extensive are books by Shepherd and Yeo^[13] and Penn et al.^[14]) Unfortunately, this book is no longer in print. Subsequent editions attempt to deal with electronic records and fail because the scope of the editions was limited and the electronic records dealt with were primarily images on optical disk, i.e., only a

fraction of the life cycle and of formats was dealt with in the text. No literature from archives was relevant to more than a tiny portion of the records life cycle, so no succor was found from that corner. Not until this author wrote *Domesticating Information: Managing Documents Inside the Organization*^[15] did a book dealing with records as business objects aimed at the graduate level exist. It is my hope that this book will be replaced by a much better graduate textbook, but so far, all candidates remain written at the community college level.

A number of courses of graduate study with some records management content have arisen. University of Pittsburgh, University of Michigan, University of Texas, University of North Carolina, and University of British Columbia are the longest running. However, there are no graduate programs in records management. The programs are combined with archives education as a specialty in schools of library and information science where the student would earn an MLS degree. To restate this bluntly, there are no courses of study in records management. Whether records management is a “discipline” or not is a nineteenth century argument that we will not address here. (I believe the same could be said of library science, information science, and archives studies that borrow the methods and trappings of social science, yet ask no grand questions, like the nature of the universe or why humanity is considered a privileged subject.) The courses of study are library studies courses with electives in archives and, usually, one course in records management being taught by an archivist or a practitioner with a CRM and, occasionally, an MLS. Conceiving of a doctoral degree at the present time is difficult as there are few graduate faculty with PhDs, sufficient knowledge of records management, and a CRM, to train a student appropriately. The courses of study where records management is included, “archives and records management,” have greatest emphasis on archives because the courses are taught primarily by archivists. Those courses of study emphasize a part of the life cycle most records managers never encounter: archiving for cultural purposes, i.e., handling information as a cultural object, rather than as a business object.

This difference between archives and records management is also what distinguishes records management from library and information science. Categorical statements about the subject of library science and information science declare the cultural and scientific purpose of information as *the* focus. Records management has an unembarrassed focus on business, including the business of government. Records management also focuses on the entire life cycle and the rules and governance necessary to domesticate information as thoroughly as possible. How scholars and culture will use information later is of relevance for only a tiny portion of information records managers manage.

ARMA has completed its core competencies. One of the purposes for creating the competencies is as a guide to

higher education to ensure that courses on records management include the knowledge and skills required to do the job. The competencies have been embraced enthusiastically by a number of different universities that teach records management including, Wayne State University, San Jose State University, University of North Carolina, and Indiana University. Some of these programs have distance learning courses also based on the competencies. ARMA has also developed a self-assessment tool so that members of the association can identify the gaps in their knowledge and skills for further education.

UNDERSTANDING THE ROLE OF RM HISTORICALLY

The history of records management has also not been well studied. Even records management textbooks trace the history of records management to the end of World War II (WWII) when U.S. archivists were drowning in documents sent to them by the many different agencies involved in the war. The historical record demonstrates that the basic concepts of records management—document control, life cycle management, and records retention—have been around for more than 5000 years.^[16] Modern records management in the United States arose when the concepts of “scientific management” that were developed on the shop floors of manufacturing in the late nineteenth century were brought into offices in the early part of the twentieth century.^[17] The term “records management” began to be used around the 1930s and was adopted by U.S. archivists immediately before and during WWII to describe what should be happening in the agencies so that the National Archives did not have to sort out the grains of wheat from the voluminous chaff. What the archivists appear to have added to the field after WWII is the term “records retention and disposition schedule” which had previously simply been called “transferring.”^[18]

Currently, few people with even a master’s degree are teaching records management in graduate courses. Many of those classes are non degree, distance learning only, because most classrooms cannot be filled by physically existing bodies more often than about every 5 years, except in very large markets like Houston and Los Angeles. The distance-learning methods range from the correspondence courses offered by Bill Benedon throughout the 1960s to online chat room courses like those at Wayne State University, and San Jose State University, to live video learning at Indiana University. Because of this dearth of education, the professional association for information managers, ARMA, along with its local chapters became one of the few sources of education in records management. Until a little more than a decade and a half ago, the educational sessions provided by the association and its chapters was on the latter half of the life cycle, because that was something nearly all members had in

common. This meant sessions on other parts of the life cycle had to be handled by special interest groups.

The lack of graduate education also led to the development of a certification, the CRM, which requires an application, 3 years of broadly based experience in records management, the passing of five multiple-choice tests, and one essay question. This certification has been in existence for more than 35 years and has become recognized in both the public and private sectors as a measure of professional knowledge. Currently, there are more than 800 CRMs world wide, this is up from 600 about 10 years ago. This is the only certification in records management, there are many seminars with examinations that offer a certificate. Those seminars do not require experience or an application other than a fee. The CRM is currently the only way to recognize general knowledge in records management.

CONCLUSION

The diversity of the work portfolios of records managers stems from the fact that records management is needed in every organization from aeronautics through government to zoos, from the part of the life cycle that is managed and the differences in types of information managed. Not all organizations have a records manager, and most suffer from that lack when information is not created appropriately, is found by persons that should not have access to it, cannot be found again, or is not destroyed properly. While an urban legend has records managers managing boxes of paper in a warehouse, they manage evidence rooms in law firms and police stations and even DNA samples and bio-authentication data (retinal scans, fingerprints, facial scans, etc.). More than the commonly held concept of documents, records managers manage logs, caches, whole databases, database outputs, copies, drafts, versions, etc. Records managers manage information about nuclear waste, municipalities, and medical patients. The information may require machines like electron microscopes, computers, and microfilm readers to access it. The information may be in a CAD (computer-aided design) program, a laboratory testing machine's memory, or at the phone company.

The problems a records manager deals with may arise through maliciousness, laziness, or lack of direction. Identifying the source of the problem is as important as managing the process of change to reach an optimal solution. The solution nearly always requires policies and procedures. Machines do not manage information, cannot judge the level of passion a change will create, nor create a judicious statement of how information must be handled under certain circumstances.

Encyclopedia of Library and Information Sciences, Fourth Edition

Contents

Volume I

Academic Libraries / Susan Curzon and Jennie Quiñónez-Skinner	1
Accessibility / Lori Bell	14
Accreditation of Library and Information Studies Programs in the United States and Canada / Karen Lynn O'Brien	18
Acquisitions Institute at Timberline Lodge / Scott A. Smith	22
African Librarianship / Natalia T. Bowdoin and Janet Lee	33
Altmetrics / Richard Cave	44
American Association of Law Libraries (AALL) / Kate Hagan	48
American Association of Museums (AAM) / Elizabeth E. Merritt	56
American Association of School Librarians (AASL) / Donald C. Adcock	59
American Library Association (ALA) / Mary W. Ghikas	67
American Medical Informatics Association (AMIA) / Don E. Detmer, Tia Abner and Karen Greenwood	85
American National Standards Institute (ANSI) / Jana Zabinski	87
American Society for Information Science and Technology (ASIST) / Charles H. Davis and Debora Shaw	90
Approval Plans / Robert Nardini	96
Arab Federation for Libraries and Information (AFLI) / Nour Soufi	100
Archival Appraisal and Acquisition / Barbara Reed	105
Archival Arrangement and Description / Joanne Evans, Sue McKemmish and Barbara Reed	115
Archival Documentation / Gavan McCarthy and Joanne Evans	127
Archival Finding Aids / Su Kim Chung and Karla Irwin	133
Archival Management and Administration / Michael J. Kurtz	141
Archival Reference and Access / Mary Jo Pugh	149
Archival Science / Elizabeth Shepherd	166
Archives / Adrian Cunningham	179
Archivists and Collecting / Richard J. Cox	195
Area and Interdisciplinary Studies Literatures and Their Users / Lynn Westbrook	209
ARMA International, Inc. / Carol E. B. Choksy	221
Armenia: Libraries, Archives, and Museums / Sylva Natalie Manoogian	228
Art Galleries / Daniel C. Danzig	241
Art Librarianship / Kathryn M. Wayne	249
Art Museums / David Gordon	259

Volume I (*cont'd.*)

Artificial Intelligence / Jianhua Chen	269
Artificial Neural Networks and Natural Language Processing / Hermann Moisl	279
Arts Literatures and Their Users / Lisl Zach	293
ASLIB / David Bawden and Lyn Robinson	301
Association for Information Science and Technology / Diane H. Sonnenwald, Charles H. Davis and Debora Shaw	311
Association for Information Systems (AIS) / William R. King and Dennis Galletta	318
Association for Library Collections and Technical Services / Charles Wilt	324
Association for Library Service to Children (ALSC) / Virginia A. Walter	333
Association of College and Research Libraries (ACRL) / Mary Ellen Davis and Mary Jane Petrowski	338
Association of Library Trustees, Advocates, Friends and Foundations (ALTAFF) / Sally Gardner Reed	361
Association of Research Libraries (ARL) / Lee Anne George and Julia Blixrud	364
Association of Specialized and Cooperative Library Agencies (ASCLA) / Barbara A. Macikas	376
Australia: Libraries, Archives, and Museums / Alex Byrne	379
Australian Library and Information Association (ALIA) / Sue Hutley, Jane Hardy and Judy Brooker	396
Authentication and Authorization / David Millman	401
Automated Acquisitions / Patricia A. Smith and Allison V. Level	408
Automatic Abstracting and Summarization / Daniel Marcu	418
Automatic Discourse Generation / John A. Bateman	430
Back-of-the-Book Indexing / Nancy C. Mulvany	440
Bibliographic Control [ELIS Classic] / Robert L. Maxwell	447
Bibliographical Society (London) / Julian Roberts	456
Bibliographical Society of America (BSA) / Hope Mayo	463
Bibliography / D. W. Krummel	468
Bibliometric Overview of Information Science / Howard D. White	480
Bibliometric Research: History [ELIS Classic] / Dorothy H. Hertzfel	492
Bibliothèque Nationale de France / Noémie Lesquins	531
Binding [ELIS Classic] / Lawrence S. Thompson	538
Biological Information and Its Users / Kalpana Shankar	554
Blind and Physically Disabled: Library Services / Jane Rosetta Virginia Caulton and Stephen Prine	563
Bliss Bibliographic Classification First Edition [ELIS Classic] / Jack Mills	573
Bliss Bibliographic Classification Second Edition / Vanda Broughton	581
Boolean Algebras [ELIS Classic] / A. R. Bednarek	591
Brazil: Library Science / Mariza Russo	597
Brazil: Library Science—Distance Education / Mariza Russo	603
Brazil: Museums / Regina Dantas and Pamela Howard-Reguindin	611
British Library / Andy Stephens	616
Business Informatics / Markus Helfert	630
Business Information and Its Users / Eileen G. Abels	635
Business Literature: History [ELIS Classic] / Edwin T. Coman, Jr.	643
Canada: Libraries and Archives / Ian E. Wilson and Sean F. Berrigan	654
Canadian Heritage Information Network (CHIN) / Shannon Ross and Paul M. Lima	675
Canadian Library Association (CLA) / Donald I. Butcher	681
Careers and Education in Archives and Records Management / Karen Anderson	685
Careers and Education in Information Systems / Paul Gray and Lorne Olfman	693

Volume I (*cont'd.*)

Careers and Education in Library and Information Science / <i>Jana Varlejs</i>	706
Careers and Education in Records and Information Management / <i>Carol E. B. Choksy</i>	715

Volume II

Cataloging / <i>Daniel N. Joudrey</i>	723
Cataloging Cultural Objects (CCO) / <i>Elizabeth O'Keefe and Maria Oldal</i>	733
Catalogs and Cataloging: History [<i>ELIS Classic</i>] / <i>Eugene R. Hanson and Jay E. Daily</i>	743
Censorship and Content Regulation of the Internet / <i>Peng Hwa Ang</i>	780
Center for Research Libraries / <i>Mary I. Wilke</i>	789
Charleston Conference / <i>Katina Strauch</i>	794
Chartered Institute of Library and Information Professionals (CILIP) / <i>Tim Owen</i>	806
Chemistry Literature and Its Users [<i>ELIS Classic</i>] / <i>Judith N. Currano</i>	814
Chemoinformatics / <i>Peter Willett</i>	830
Children and Information Technology / <i>June Abbas</i>	839
Children's Literature / <i>Judith V. Lechner</i>	852
Children's Services in Libraries / <i>Virginia A. Walter and Melissa Gross</i>	876
China: Libraries, Archives, and Museums / <i>Priscilla C. Yu and TzeHuey Chiou-Peng</i>	886
Circulation Services / <i>Vanessa Irvin and Jeff E. Bullard</i>	916
Citation Analysis / <i>Howard D. White</i>	923
Citation Indexes and the <i>Web of Science</i> / <i>Marie E. McVeigh</i>	940
Citer Motivations [<i>ELIS Classic</i>] / <i>Terrence Brooks</i>	951
Classification Theory / <i>Clare Beghtol</i>	958
Clinical Decision-Support Systems / <i>Kai Zheng</i>	974
College Libraries / <i>Thomas G. Kirk, Jr.</i>	983
Communication and Communication Studies / <i>Brenda Dervin and CarrieLynn D. Reinhard</i>	994
Communication Policy: United States / <i>D. Linda Garcia</i>	1007
Community Informatics / <i>Kate Williams and Joan C. Durrance</i>	1027
Complexity and Self-Organization / <i>Francis Heylighen</i>	1034
Computer-Mediated Communication (CMC) / <i>Michael A. Chilton and Roger McHaney</i>	1044
Computer-Supported Cooperative Work (CSCW) / <i>Kevin L. Mills</i>	1053
Conservation and Preservation of Museum Objects / <i>Ellen Pearlstein</i>	1068
Controlled Vocabularies for Art, Architecture, and Material Culture / <i>Murtha Baca</i>	1076
Corporate Archives / <i>Philip Mooney</i>	1081
Corporate Art Collections / <i>Laura Matzer</i>	1086
Corporate Information Centers / <i>Barbara M. Spiegelman and Nancy Flury Carlson</i>	1094
Corporate Records Management / <i>Barbara M. Cross and Barbara E. Nye</i>	1104
Credibility and Cognitive Authority of Information / <i>Soo Young Rieh</i>	1113
Croatia: Libraries, Archives, and Museums / <i>Aleksandra Horvat, Josip Kolanović and Visnja Zgaga</i>	1121

Introduction to the Encyclopedia of Library and Information Sciences, Fourth Edition

How to Use This Encyclopedia

Entries are arranged alphabetically in this encyclopedia (see end papers for alphabetical list). The editors of this edition (ELIS-4) have decided to forego the Topical Table of Contents that was provided in ELIS-3 by editors Marcia Bates and Mary Niles Maack. At the time of publication of ELIS-3, the Topical TOC was crucial for readers to get a sense of how subjects were grouped and an understanding of the field or subfield through the clustering of categorical entries in the print edition. ELIS-4 is envisioned as a primarily online reference work where a Topical TOC does not serve the same purpose. The print edition is served well by the main TOC as well as the detailed index, while entries in the online version are easily discoverable through title, author, keyword, and full text searches.

In sum, relevant entries can be found by

1. Entry title (alphabetical arrangement of entries in the encyclopedia or listing in the end papers)
2. Specific name or keyword, including the index at the end of each volume

If the first name or keyword searched is not found, try several more variations—either different words or a different order of words. Most topics are described in several ways in the literature of a discipline, and the first term or phrase that comes to mind may not be the one used here.

Scope of the Encyclopedia

The title of the third edition, *Encyclopedia of Library and Information Sciences*, ended with the letter “s” because the encyclopedia was broadened to cover a spectrum of related and newly emerging information disciplines, including archival science, document theory, informatics, and records management, among others. The fourth edition continues this trend but with an extensive focus on the aspects of library and information sciences that have been heavily impacted by the adoption and reliance on online information distribution. This focus is reflected in the inclusion of numerous new entries such as digital preservation, altmetrics, web-scale discovery services, demand-driven acquisitions, and global open knowledgebases. Alongside these entries based on entirely new topics, the expanded use of the Internet for information has led to new treatment of traditional LIS topics such as resource description and access (RDA) that reflects the adoption of new standards for cataloging.

ELIS-4 also seeks to build upon the description of professional practice to round out the theoretical perspective that previous editions covered very well. Both current editors are academic research librarians and thus, focused heavily on addressing gaps in the encyclopedia related to academic research information while still relying heavily on the structure established by editors of ELIS-3. For example, ELIS-3 introduced country profiles and ELIS-4 builds upon that with new entries for New Zealand and a third on Brazil, in addition to revisions for Slovakia, Netherlands, Canada, Belarus, Kazakhstan, and Brazil among others. This edition also expands the number of entries for named cultural and information entities that did not appear in previous editions, such as the National Library of Medicine, North American Serials Interest Group (NASIG), the International Association of Scientific, Technical and Medical Publishers (STM), and ASLIB, as well as entities like the HathiTrust that have been established since the last edition was published. A number of new entries describing important information conferences such as the Acquisitions Institute at Timberline, the Charleston Conference, and Electronic Resources in Libraries (ER&L) also help round out the encyclopedia and further the description of the current state of academic research librarianship.

ELIS-4 also continues the tradition of designating important entries of historical or theoretical importance as “ELIS Classics.” These are entries by major figures in the library and information sciences or those that describe core concepts in LIS theory, practice, or education that appeared in earlier editions of the encyclopedia. The current editors preserved the approximately 40 previous “ELIS Classics” and designated 13 previous entries as new “ELIS Classics.”

There are more than 550 entries, of which more than 20 are new, another 93 are revisions to prior entries that have been brought up to date by their authors or by new authors, about 30 are ELIS Classics, and about 400 are reprinted from an earlier edition since they have remained relevant to the present. It is important to note that the editors also had to make some choices related to retiring entries that were no longer relevant—due to the passage of time and the development of the field, the technologies and theories described in those entries were deemed to be out of scope for the new edition and thus not revised or reprinted.

Encyclopedia Authors

As in past editions, the authors writing for the encyclopedia are major researchers, librarians and practitioners, and leaders in the fields and subfields in the disciplines in which they are writing. Noted scholars are well represented, and a number of authors are former leaders in LIS associations, including the American Library Association (ALA), the Association for College and Research Libraries (ACRL), the International Federation of Library Associations and Institutions (IFLA), the American Society for Information Science and Technology (ASIS&T), and the American Association of Library and Information Science Education (ALISE). In addition, there are many contributors who are current or former directors of major institutions. As in past editions, the editors are very proud of the range and diversity of authors who have written these entries for the encyclopedia and we thank them for sharing their expertise with the current and future readers and researchers in the field.

Finally, the editors for ELIS-4 have grappled with the challenges of entry generation that was noted by previous editors in nearly every edition: that not all ideas, topics, and potential entries were able to be completed for publication in this edition. While we made a valiant attempt to include entries identified by ELIS-3 editors but not secured for publication in that edition, we sometimes could not find authors willing to take those topics on. Similarly, we were sometimes unable to secure revisions to entries from new authors when previous authors were unable to perform that task. To the greatest extent possible, we endeavored to replace authors when entries were deemed important enough to appear in ELIS-4 but initial or previous authors had to decline or defaulted. No doubt, the editors of ELIS-5 will also pick up the mantle and attempt to round out the encyclopedia with entries for anything that ELIS-4 missed. As noted by editors Bates and Niles Maack in ELIS-3, this problem of missing topics was also acknowledged by Allen Kent, editor of the first edition of ELIS. Kent stated in 1973, "I have prepared this presentation to make sure the lessons of Diderot-d'Alembert are recalled in terms of encyclopedia-making as an exercise in the art of the possible."

Background and Development of the Encyclopedia

The first edition of ELIS, under the editorship principally of Allen Kent and Harold Lancour, was published between 1968 and 1982. The 33 volumes of the first edition were published in alphabetical sequence during those years. After the "Z" volume appeared in 1982, a number of supplements were published at roughly the rate of two per year, up to and including volume 73, which appeared in 2003. Miriam Drake was appointed editor for the second edition, which appeared in 2003, both online and in paper. The second edition came out at one time in four large-format volumes, with a supplement in 2005 [3]. Kent and Lancour covered a wide range of librarianship, information science, and some computer science topics. Drake, an academic library director, emphasized academic libraries, and the ELIS-2 volumes contained many profiles of major academic libraries and professional library associations.

The third edition, under the editorship of Marcia Bates and Mary Niles Maack, reflected a growing convergence among the several disciplines that concern themselves with information and the cultural record. As information science educators and noted researchers in the field, their focus was on growing the encyclopedia in the theoretical fields of information sciences as well as drawing together the associated information and cultural disciplines such as archival sciences and museum studies within the overall field of LIS.

For this edition, we have focused on developing the encyclopedia to reflect the changing nature of information production and consumption through online and digital forms. We have also endeavored to fill in gaps in the description of important people, places, and theories in the information sciences, and further enhanced the description of important concepts related to the provision of research information and the field's major institutions.

We continue to see the audience for the encyclopedia just as previous editors have: as principally consisting of 1) the educated lay person interested in one or more of its topics, 2) students learning about a topic, and 3) professionals and researchers in the several fields who want to learn about something new, or to be refreshed on a familiar topic.

We honored the previous editors by reengaging their superb Editorial Advisory Board with significant new additions of experts known to the current editors. (See listing in the front matter.) These leaders and experts from as many disciplines as are in the encyclopedia provided excellent guidance and feedback for the editors as they began the process of new topic generation, evaluation of previous entries, and offering to author or review numerous entries throughout the process of publication.

All new and revised entries were reviewed by one or more outside expert reviewer as well as one or more of the editors. Referees provided invaluable feedback to authors, including noting errors or omissions as well as making suggestions on additional aspects of the topic to cover. While we made every reasonable attempt through this process to check the accuracy of every entry and every fact, undoubtedly readers will find some topics explained more thoroughly or accurately than others. Indeed, due to the time frame from the beginning of the generation of the fourth edition and the time of publication, readers will reasonably note that some topics have been quickly superseded due to this passage of time, so the

date of acceptance of the entry will be noted on each entry since several years may have passed since the writing of the entry and the publication of this edition.

Acknowledgments

This edition of the encyclopedia was possible only through the countless hours that the editors, John McDonald and Michael Levine-Clark, spent reviewing the previous encyclopedia entries, outlining the topics that were missing or that were newly emerging in the field, and identifying appropriate expert authors to write those new entries. In addition, the editors devoted extensive time to corresponding with previous authors encouraging them to revise their entries, and finding replacement authors for important entries that needed revisions but whose original authors were unavailable.

Both editors wish to acknowledge the expertise of each other and their knowledge of our field, their extensive network of contacts, and their ability to work closely together to ensure the success of this encyclopedia. Neither of them could have completed this project alone.

They acknowledge and thank the Taylor & Francis Group editors, Claire Miller and Rich O'Hanley, as well as Susan Lee, who passed away at the early stages of the preparation of this edition, and more recently, Alexandra Torres, who supported and kept the editors and authors on track over the course of the years of work on this edition of the encyclopedia.

The editors thank the authors who wrote and revised entries, and the huge number of reviewers who refereed the entries. Without their dedication, expertise, and willingness to share their knowledge with others, there would be no encyclopedia. They also wish to thank the Editorial Advisory Board for their advice, suggestions of topics and authors, their hours spent writing or reviewing for the final edition. They also wish to thank the previous editors, Marcia Bates and Mary Niles Maack, whose organization and structure for ELIS-3 provided an excellent blueprint for ELIS-4.

Cataloging

Daniel N. Joudrey

School of Library and Information Science, Simmons College, Boston, Massachusetts, U.S.A.

Abstract

Bibliographic control, the larger field of which cataloging is a part, is discussed in order to provide the context for cataloging. A major product of the process of cataloging, the catalog, is explained in order to underscore why cataloging is needed. The processes for completing original cataloging are delineated, followed by a brief look at cooperative and copy cataloging. Methods for encoding metadata records for online storage and display are outlined.

INTRODUCTION

The purpose of this entry is twofold: 1) to set the context in which cataloging takes place and 2) to introduce the basic concepts of cataloging. The discussion begins with an introduction to the realm of bibliographic control and a brief exploration of where cataloging fits within that realm. Catalogs are discussed in terms of their forms, functions, and components. An overview of the entire process of cataloging—descriptive cataloging, subject analysis, and authority control—is then given, followed by a look at cooperative and copy cataloging that make original cataloging of all materials for every collection unnecessary. Finally, there is mention of the formats of bibliographic records in catalogs and some emerging trends in the twenty-first century related to encoding and sharing bibliographic metadata.

BIBLIOGRAPHIC CONTROL

Cataloging is a subset of the larger field that is sometimes called *bibliographic control* or *information organization*, and it is helpful to view it in that context. Bibliographic control is defined by Elaine Svenonius as “the skill or art... of organizing knowledge (information) for retrieval.”^[1] Richard P. Smiraglia defines it as a process that encompasses “the creation, storage, manipulation, and retrieval of bibliographic data.”^[2] In other words, bibliographic control is the process of describing information resources and providing name, title, and subject access to the descriptions, resulting in records that serve as surrogates for the actual items of recorded information. These surrogate records (sometimes called *entries*, *bibliographic records*, or simply *metadata*) are then placed into information retrieval tools, where the records act as pointers to the actual information resources. The comprehensive descriptions found in the records provide users with

enough information to determine the potential value of the resources without actually having to view the items directly. Surrogate records are stored in a variety of retrieval tools including bibliographies, catalogs, indexes, finding aids, museum registers, bibliographic databases, and search engines.

The concept of bibliographic control is applied to all types of information resources including books, journal articles, corporate records, physical objects, digital images, and myriad other formats, and it includes both human-based and machine-derived metadata creation. While it includes activities such as bibliography, indexing, archival description, etc., the presence of the root word *biblio* suggests to some that bibliographic control focuses primarily on books, a resource type most commonly associated with libraries and library cataloging. Consequently, in recent years another phrase—*information organization* (or sometimes *organization of information*)—has been used increasingly to refer to the overarching concept of bibliographic control (i.e., describing all types of information resources for the purpose of retrieval). Arlene G. Taylor, in *The Organization of Information*, points out that “retrieval of information is dependent upon its having been organized.” She goes on to note that in addition to retrieval, the “organization of information also allows us to keep a usable record of human endeavors for posterity.”^[3]

In the universe of all knowledge, including knowledge that cannot necessarily be expressed verbally (e.g., music, and art), there is a certain amount of that knowledge that has been recorded in some way (e.g., written down, digitized, and painted). This subset is often referred to as the *bibliographic universe*. Taylor describes the bibliographic universe as “all instances of recorded knowledge,” and goes on to state, “Only the bibliographic universe can be controlled.”^[4] Such control is maintained through the use of retrieval tools in which each discrete information resource is represented by a surrogate record. Anyone

who has attempted to maintain a list of references to articles, a collection of books, or a set of bookmarks for web resources on a particular subject (or by a particular artist or author) has practiced bibliographic control over a very small part of the bibliographic universe. For such projects to succeed, it is necessary to decide what data elements to record about each resource; for example, it may be decided that creator(s), title, subject keywords, a standard identifier, and the location of the resource should be included in the description. The data elements that are recorded to describe a resource are referred to as *metadata*—a term that is often defined as “data about data,” but is more usefully understood as a set of important attributes of a resource that assist in finding, identifying, selecting, obtaining, and managing the resource. As the collection grows, so does the complexity of storing, managing, and retrieving needed information. When this occurs, the art and skills of organizing information become essential for the successful creation, maintenance, and use of the collection. In traditional library settings, the art and skills of bibliographic control are referred to as *cataloging*, and the result of these activities is a retrieval tool called a *catalog*.

CATALOGS

A catalog is an organized set of bibliographic records that represents the holdings of a particular collection and/or resources accessible in a particular location. It may be arranged by classification notation, alphabetically by names, titles, or subjects, and in various other ways. A collection may consist of any of several types of materials—books, periodicals, maps, coins, sound recordings, paintings, musical scores, to name just a few. Traditionally, the collection represented by a catalog has been located in one place or at least in different parts of the same institution. Increasingly, however, catalogs may represent the holdings of more than one library, as libraries form consortia or otherwise link their catalogs for the purposes of interlibrary sharing. (Such catalogs are sometimes called *union catalogs*.) In addition, catalogs may include surrogate records for resources that are not owned by the institution, but to which the library can provide access, including websites, online subscription databases, e-books, online journals, and digital library collections.

Why prepare catalogs? Catalogs are necessary whenever a collection of resources grows too large to be remembered item for item. A small private library or a classroom library has little need for a formal catalog; the user can recall each book, sound recording, map, or other such item by author, title, subject, the item's shape, its color, or its position on a particular shelf. When such a collection becomes a little larger, an informal arrangement, such as grouping the items by subject categories, provides access to them. When a collection becomes too large for such a simple approach, a formal record of the

collection is necessary. There are two major reasons to make such a formal record of larger collections: for retrieval and for inventory purposes. In addition to being unable to remember what is in a large collection for access purposes, it also becomes impossible for the owner to remember what has been acquired, lost, replaced, etc. A catalog can serve as a record of what is owned as well as a retrieval tool.

Forms of Catalogs

Historically, library catalogs have appeared in various forms. In ancient times, papyrus scrolls and clay tablets were all the rage, but in today's library the catalog primarily appears in one of four distinct formats: book catalogs, microform catalogs, card catalogs, and online public access catalogs (OPACs). While book, microform, and card catalogs are still used in many places around the world, the OPAC has become the most commonly used form of catalog in the Western world. Of these four forms of catalogs, the book catalog is the oldest. In its earliest appearances, the book catalog contained handwritten entries, but by the end of the nineteenth century, the printed book catalog was the most common form of catalog in Western libraries. Today, they are still used in some libraries that cannot or have chosen not to automate access to their collections and in other libraries for some parts of their collections. Because printed book catalogs were rather expensive to produce and quickly became outdated, they were gradually replaced by card catalogs.

Until the late twentieth century, the card catalog was the library catalog most often found around the world. In a card catalog, each information resource is represented by a set of standard 7.5×12.5 cm cards (roughly 3×5 in.), although in the beginning of the card era the size was not always standard. Multiple cards are prepared in order to represent the various access points needed in the catalog (i.e., a card for each author, a card for the title of the work, a card for each subject represented in the work, a card for a series, etc.). Cards were at first handwritten before the typewriter came into standard use. Typeset cards were available from the Library of Congress (LC) beginning in 1901. Later, cards were often prepared by photoreproduction of a printed or typed original. Cards are now most often computer-produced from machine-readable catalog records. The card catalog is still found in libraries throughout the world (it is sometimes difficult to remember that in some places, electricity is not always reliably present—making online catalogs impractical). In the United States, card catalogs can still be found in small libraries that cannot afford the software and equipment necessary to switch to an online catalog. They are also used in some larger libraries for specific parts of the collection, perhaps for older materials or special collections.

Microform catalogs became popular with the development of computer output microform (COM) in the

mid-to-late twentieth century. COM catalogs could be produced in either microfilm or microfiche. With this form of catalog, it was feasible to provide a completely integrated new catalog every 3 months or so, rather than providing supplements to be used with a main catalog as was needed with printed book catalogs. COM catalogs did require the use of microfiche or microfilm readers—bulky pieces of equipment that took up a great deal of space and were not portable. While COM catalogs were useful from the perspective of librarians, microform catalogs were not popular with users.

The online catalog, often referred to as an *OPAC*, has rapidly become the catalog of choice among librarians and users. The OPAC is usually one component of a larger automated system called an *integrated library system* (ILS)—a computer system that includes various modules to perform different functions in a library while sharing access to the same database. Other modules in the ILS may exist for cataloging, authority control, acquisitions, serials management, circulation, course reserves, and interlibrary loan functions. In the OPAC, the public interface to the ILS, bibliographic records stored in the ILS database are displayed on a screen in response to requests from users. Until the 1990s, such integrated systems were costly, and only very large libraries could afford them. Now, systems have been developed for use on every size computer and have become more affordable, including some that are available freely as open source software. In the beginning of the twenty-first century, as technology continues to progress, some difficulties associated with integrated library systems are becoming more evident. Often, the online catalog is negatively compared to web interfaces for popular online bookstores or to major Internet search engines, suggesting that catalogs are no longer a favored retrieval tool among users. In an attempt to satisfy users and create a more friendly search environment, new innovations in system design (i.e., the inclusion of meta-searching, faceted browsing, cover art, user tagging, tag clouds, and user reviews) are starting to appear in both OPACs and *discovery environments*, which are a user interfaces that work in coordination with the OPAC to provide alternate views of the metadata contained within. For example, a large set of results from a keywords search may be browsed using classification, creators, genre, subjects, dates, and various other facets as guideposts. Most recently, a number of library automation vendors have been offering new products, sometimes referred to as *library services platforms*, which go beyond the tradition ILS in their “engagement with electronic and digital content. In their own distinctive ways, these recently announced or delivered systems aim to break free of the models of automation centered mostly on print materials deeply embodied by the incumbent line of integrated library systems... to handle all the different forms of content.”^[5]

Functions of Catalogs

Catalogs, whatever their form, have four basic functions. The first is the *identifying* function. All retrieval tools aim at allowing a user, who has a citation or has a particular resource in mind, to match that known item with an entry in the tool—limited, of course, by the scope of the retrieval tool. The scope of a library catalog, for example, is often the items owned or made accessible by the institution; therefore, the user should be able to match or identify or find an entry for a known item that the library owns, or for an item to which the local institution can provide access.

The second function is the *collocating* or *gathering* function. Collocation is a means for bringing together in the catalog like and closely related entities; for example, resources about dinosaurs are grouped together under the subject heading *Dinosaurs*. The subject heading in this case acts as a gathering point for all resources about this topic. In many cases, a particular work is shown in relation to a larger group of connected works. For example, the bibliographic record for a play based upon Mark Twain’s *Huckleberry Finn* should be found with records for editions of *Huckleberry Finn*, which in turn can be found with records for other works of Mark Twain. The most common way of accomplishing collocation is through the process of *authority control*—using a unique character string (or some other form of identifier) to represent each name, work, or subject in order to achieve consistency within the catalog or other retrieval tool. If entries for *Huckleberry Finn* are sometimes found under *H* (for *Huckleberry Finn*) and sometimes under *A* (for *Adventures of Huckleberry Finn*) with no connecting references, collocation has not been accomplished.

The third function of catalogs is the *evaluating* or *selecting* function. This function allows a user to choose from among many different records the one that best seems to represent the information or specific physical resource desired. For example, a user looking for a particular edition of *Huckleberry Finn* should be able to select it from among several, if it is one of those listed in the catalog; or, given a choice between a spoken recording on a cassette tape or in the form of an MP3 file, a user could choose the one most appropriate for his or her circumstances, such as the resource that can be used with the equipment available to that user. It can be seen that the first three functions, first described by Charles A. Cutter as his “objects” of the catalog,^[6] are somewhat interdependent.

An additional function of a catalog is that of *locating* or *obtaining* resources, a function not always served by other bibliographic tools. One can tell from a library catalog whether the library contains a certain resource and, if so, where it is physically located. This is true even of union catalogs in the sense that the catalog identifies which libraries house particular items, although one may need more detail to know where in a particular library to find

an item. With many catalogs, the circulation system is linked, making it possible for the user to learn whether or not an item is available for use. Virtual locations of online resources are provided in catalogs through their uniform resource locators (URLs).

Components of Catalog Systems

Basically, there are three components comprising a whole catalog: a public access catalog, a shelflist, and an authority file or files. In printed catalogs, these are separate physical components. In online catalogs, the OPAC and shelflist are really different ways to search the same file; the authority file is actually a separate file. The public access catalog is the main component, giving access to bibliographic records via author, title, subject, or keyword. This is the catalog component readily available for the use of library patrons. Increasingly, OPACs include links to enhancements held outside the bibliographic records, such as online versions of the resource, tables of contents, and publisher blurbs and reviews.

A shelflist is a record of the holdings of a library; entries are arranged in the order of the items on the shelf—hence the name *shelflist*. With the cataloging of datasets, software, and web resources, for which there is often not a physical item to be placed on a shelf, the name is less descriptive. Records of a library's holdings for such entities may be placed in order by classification notation, acquisition number, or some other device. A shelflist record usually contains a record of ownership of numbers of copies and/or volumes held, as well as information about locations of copies, especially when a library is made up of several collections. Shelflists in print form have traditionally been kept in areas not accessible to the public. There have been notable exceptions to this, however, especially in situations where the areas in which materials are shelved (called *stacks*) are not open to the public. In these situations, browsing the shelflist can substitute for browsing in the stacks. Another change in the availability of shelflists has occurred with online catalogs. When classification is an access point in the catalog, the results of classification notation searches are displayed in shelflist (i.e., classification) order, essentially making the shelflist available to everyone. In addition, most online catalogs provide copy and location information at all access points.

Authority files contain records of the forms of names, titles, and subjects that have been chosen as the standardized forms to use as *authorized access points* (AAPs) in a catalog. An AAP is the exact string of characters used to represent an entity consistently. Authority records also contain lists of references made in the public catalog from unauthorized to authorized forms, so that users do not have to know the actual authorized forms of name, title, or subject in order to retrieve the needed information from

the catalog. Traditionally, authority files, like shelflists, have been kept in areas inaccessible to the public. Again, online catalogs have changed this. In some systems, authority files serve as indexes to the catalog.

Online catalogs usually contain all three of these components, but they are not always as distinctly separate as they are in printed catalogs. Authority files still are nonexistent in some online catalogs, and in others, they are unlinked files. Increasingly, however, links between the authority files and the bibliographic files are established so that the authority files may serve as the index(es) to the access points used in the catalog, and in some cases they serve to alert catalogers automatically to inconsistencies in the authority-controlled metadata. In addition, a number of other components have been added to online catalogs. Acquisitions and in-process records are available to the public in many systems, and circulation information is available in virtually every system.

CATALOGING

The means by which catalogs are prepared is through the process called *cataloging*. This process usually begins with descriptive cataloging, including access point choice and creation, and then moves into subject analysis. Additionally, authority control and the encoding of the metadata are mixed into the process.

Foundations of Twenty-First-Century Cataloging

In the early years of the twenty-first century, the international cataloging community has worked to create new standards and models to inform information organization activities. These included the design and elaboration of sound theoretical models to illustrate the bibliographic universe and its components, such as *Functional Requirements for Bibliographic Records* (FRBR) and *Functional Requirements for Authority Data* (FRAD), both developed by the International Federation of Library Associations and Institutions (IFLA). These efforts also included the formation of principles to guide the cataloging process, which resulted in the *Statement of International Cataloguing Principles* developed through a series of IFLA Meetings of Experts on an International Cataloging Code (IME ICC). More recently, these foundational documents supported the development of a new set of cataloging instructions: *RDA: Resource Description & Access* (RDA), an international cataloging standard grounded in Anglo-American cataloging traditions.

FRBR, published by IFLA in 1998, is a conceptual model of the various entities found in the bibliographic universe and the relationships among them.^[7] In other words, it is an entity-relationship model—an approach commonly used in modeling relational databases—which attempts to describe users' requirements for bibliographic

systems. The FRBR model is thus concerned with the entities found in the bibliographic universe and how those entities interact (i.e., the relationships among the entities). The bibliographic entities are broken into three groups in the FRBR model. Group 1 includes resource-based entities and the hierarchical levels represented in them. These include two abstract levels, *works* and *expressions*, and two concrete levels, *manifestations* and *items*. The first entity, *work*, exists only in the mind of its creator, but the second entity, *expression*, is the articulation of the work's ideas or concepts through spoken words, alphanumeric symbols, choreographic notation, musical notation, or some other method of communication. A *manifestation* is a physical embodiment of an expression of a work. It is a material object or electronic representation of the expressed work in the form of books, video recordings, web pages, sound recordings, paintings, and so on. An *item* is a single, specific instance of a manifestation; that is, it is the exact copy that is owned or accessed by a user. Group 2 represents those entities responsible for the establishment of group 1 entities. These include *persons*, *families*, and *corporate bodies*. These entities have several roles related to group 1 entities; for example, a person may create a work or help to realize an expression, a corporate body may produce a manifestation, or a family may own a particular item. The entity *family* is included in group 2, even though it is not found in the FRBR model, because it is discussed in FRBR's companion document, FRAD.^[8] Group 3 entities include subject entities described as *concepts*, *objects*, *places*, and *events*, as well as the group 1 and group 2 entities (which may also be used as subjects). The FRBR model presents ways to describe the entities with their attributes and also ways to relate various entities to each other. FRBR also reminds us that users want to find, identify, select, and obtain information in the resources that we catalog. A number of libraries and ILS vendors have experimented with systems that can make use of the FRBR model, and FRBR and FRAD are two foundations for the new set of descriptive cataloging guidelines, RDA. In 2016, a world-wide review of the FRBR-Library Reference Model (FRBR-LRM) began. The FRBR-LRM was developed to harmonize the separate "Functional Requirements" conceptual models into a single standard covering all aspects of bibliographic, subject, and authority metadata.^[9] At the time of this writing, significant changes in cataloging's underlying conceptual model are expected as a result of these revisions.

After a series of five meetings held between 2003 and 2007, the IME ICC disseminated in 2009 their *Statement of International Cataloguing Principles* (ICP). The purpose of the IME ICC meetings was to update the Paris Principles, which were agreed upon in 1961 and underlay all the major cataloging codes used throughout the world. The meetings' discussions were the basis for international agreement on an updated set of cataloging principles and a glossary of terminology. These principles emphasize convenience for users, stating, for example, that metadata

should be available in languages and scripts that users can read. In addition to discussing 10 basic objectives that guide the construction of cataloging codes (i.e., convenience, accuracy, standardization, etc.), the statement addresses six major principles related to entities, attributes, and relationships; functions of the catalog; bibliographic description; access points; authority records; and foundations for search capabilities. In 2015, IFLA's ICP was revised, and a world-wide review began in 2016. Some additions to the general principles are expected after the revisions are complete.^[10]

RDA, published in 2010, is a set of cataloging rules constructed by the RDA Steering Committee (RSC) to supersede the last version of *Anglo-American Cataloging Rules* (AACR). It is solidly based on FRBR, FRAD, and the IME ICC's *Statement of International Cataloguing Principles*. The goals of the RSC were to overcome the inconsistencies and inadequate structure of AACR and to provide rules for meaningful metadata for multiple types of resources that can be used by a wider audience than just the Anglo-American cataloging community. At the time of this writing, it appears that RDA is becoming an international standard for cataloging; it has been translated into Chinese, Finnish, French, German, Italian, and Spanish, and it has been adopted by over a dozen national libraries from around the world, with more expected to adopt it in the future. It is hoped that by providing a more all-encompassing set of rules for description and access, greater cooperation between libraries and other information communities may be developed.^[11] Whether this occurs or not is one of the main issues to be resolved in the realm of bibliographic control.

Encoding

Unless catalog cards are typed manually, encoding permeates the entire cataloging process. The results of each of the descriptive, subject, and authority processes are entered into a machine-readable form that is compatible with the online system in which the catalog record will be used. In the current cataloging environment, the most commonly used encoding standard is the MACHine-Readable Cataloging (MARC) bibliographic format, or in the case of authority records, the MARC authorities format. Increasingly other forms of encoding—often in the form of schemas established in the eXtensible Markup Language (XML)—are being found in integrated library systems, discovery environments, and library services platforms. At the time of this writing, a project to develop an alternative approach for sharing metadata, the Bibliographic Framework Initiative (BIBFRAME), is being headed by the Library of Congress.^[12]

Descriptive Cataloging

Descriptive cataloging is the phase of the cataloging process that is concerned with the identification and description of a resource, the recording of this information in the form of a cataloging record, the selection of name and title

access points the formation of AAPs for the names and titles, and the encoding of these data elements so that they will be machine-readable. Descriptive cataloging describes the makeup of a resource and identifies the persons or institutions responsible for the intellectual contents. Descriptive cataloging is concerned with both the carrier and the content of a resource, but does not address the topical contents of the resource, which are the province of subject cataloging.

Description

Identification and description are interrelated processes in descriptive cataloging. Identification consists of the choice of conventional elements, guided by a set of rules based on agreed-upon international standards. When the cataloger has properly identified the conventional elements, they are described in a catalog record in such a fashion that the description is unique and can be applied to no other entity in the collection. In other words, each resource should be distinguished from everything with which it could be confused. Elements considered essential for this purpose in describing physical resources are usually title, statement of responsibility, edition information, standard numbers, and publication, distribution, or production information. Physical description—extent and size of the resource—and series metadata are often essential to this purpose as well. Components essential for describing virtual resources (e.g., Internet documents) are title, statement of responsibility, version information (if present), date information, and location information (e.g., URL). In addition, the cataloger gives elements of description that may be helpful to a user in evaluating the potential use of the resource, such as whether it is illustrated, its intended audience, what equipment is needed to use it, any restrictions there may be on use, or its mode of access. Such descriptive metadata may be part of the conventional elements or may be contained within (sometimes extensive) notes in the catalog record.

Access

After describing a resource, the cataloger selects particular names and titles to be access points. Names of persons, families, and corporate bodies associated with the creation of a work are chosen according to the cataloging rules used. Title access points also are chosen—in addition to the obvious main title (called *title proper*) there may be alternative titles, variant titles, series titles, and titles of other works related in some way to the work being cataloged. The names and titles chosen are then formatted as AAPs, constructed in a form that will make them readily accessible in the catalog and will enhance collocation of related resources. This is done using cataloging instructions and through reference to the authority file (ensuring that the authorized form of name is used consistently), thus continuing the process of authority control.

In earlier cataloging practices, one access point was chosen as the *main entry* or *primary access point*. The main entry was typically the person or entity primarily responsible for the creation of a work. Because one access point was considered to be the main entry, the remaining access points were referred to as *added entries*. Both types of entries allowed for the retrieval of resources in the catalog, but the main entry had an additional function of identifying the work embodied in the resource being cataloged. A combination of main entry and title was the most common way of referring to a work in the realm of cataloging. In RDA, the terms *main entry* and *added entries* are not used, but the work-identification function of main entry is still needed. Catalogers require a consistent name for a work and the most logical one is the through the creation of an access point comprising the AAP for the principal (or first-named) creator along with the preferred title for the work (e.g., Shakespeare, William, 1564–1616. Hamlet).

Subject Analysis

The subject analysis process begins with determining the *aboutness* of the work, that is, what subject concepts are covered by the intellectual or artistic content of a work, and in the case of some creative works, the form or genre represented by the resource. Once these have been determined, the concepts are then translated into one or more forms of controlled vocabulary. Controlled vocabularies can take a verbal approach (i.e., subject headings or descriptors from a thesaurus) or a notational approach (i.e., symbols from a classification scheme) to subject representation. When taking a verbal approach, as many subject headings as are appropriate are chosen from a standard list to represent the topics of the work. Again, an authority file must be consulted if the works are to be properly collocated into the catalog with other works covering the same or related subject concepts. Verbal subject representation may take the form of single terms assigned individually to a work to represent a single concept, or it may take the form of strings of terms to represent multiple facets of a topic, if the controlled vocabulary allows this type of heading construction.

When using the notational approach, symbols from the classification scheme used by the library are assigned to the resource. Traditionally in the United States, classification serves both as a means for bringing an item in close proximity with other like items in the catalog and, in the case of tangible resources, as the first element of the *call number*, a device used to identify and locate a particular item on library shelves. The cataloger, therefore, must choose the one best place in the classification scheme for the item. In other parts of the world, however, or in nontraditional collections, more than one classification notation may be assigned to a resource to represent multiple topics or multiple aspects of subjects found in the content. These multiple classification numbers may be

used as searchable access points in the catalog, but with only one being chosen to represent the shelf location of the item.

Authority Control

Authority control is the result of the process of maintaining consistency in the verbal forms of names, titles, and subjects terms used to represent an entity, and the further process of showing the relationships that exist among those names, works, and subjects. It is accomplished through use of descriptive cataloging instructions (in the case of names and titles), use of a controlled vocabulary (for subject headings and descriptors), and reference to an authority file to create an authorized character string. An authority file is a group of records for the names, titles, or subjects chosen for use in a catalog. Each authority record in an authority file may contain, in addition to the form chosen for use as the AAP, a list of variant forms or terms that may be used as references. More recently, additional metadata elements reflecting attributes of persons, families, corporate bodies, and works have been added to authority records to provide more understanding of the entity being described in the record. Elements such as place and date associated with the entity, gender, field of activity, associated language, occupation, associated group, and the like provide greater context for the entity. A carefully prepared authority record also contains a list of sources consulted in the process of deciding upon the authorized form of name or term, the variant forms to use as references, and additional data elements to include. It is possible to practice authority control by letting the catalog itself serve as the authority file, that is, by assuming that the form of heading used in the catalog is correct. In larger catalogs, this has proved to be difficult, and it is very challenging to keep track of references without an authority file.

It is authority control that makes cataloging more than just a process of creating a series of bibliographic records to represent discrete works, because authority control allows the cataloger to create AAPs for names, titles, and subjects that show the relationships among the works cataloged. It means that the AAP for a particular name, when used in different records, is always consistent so that bibliographic records for all works by and about the same person or family, or emanating from the same corporate body, can be displayed together. An AAP for a work (formerly called a *uniform title*), which often consists of the name of the principal author followed by a standardized title, can be consistently presented so that bibliographic records for all editions, translations, sound or video recordings, adaptations, abridgements, etc., of a work can be displayed together. The subject heading or descriptor that is used to represent the same topic or concept in different works can be used in one form so that to the extent that works are identified as being about the same

subject concept, all such works can be displayed together collocated under the authorized subject term. Authority control of subject terminology also makes it possible to refer users from terms not used (e.g., Haplorhini) to those that are used (e.g., Monkeys), as well as from terms that are used (e.g., City dwellers) to broader terms (e.g., Persons) and/or narrower terms (e.g., Yuppies) and from terms that are used (e.g., Cooking) to other related terms that may be of interest (e.g., Gastronomy).

As we move more and more into the international arena, virtual authority control connecting national authority files with each other is becoming essential. Creators of catalogs in various countries using various languages need to be able to designate their own “authorized” forms of names, while at the same time recognizing variant names for the same person or other entity in other languages. International catalogs should not be required to use the English-language authorized forms, but should be able to link users to entities they seek, regardless of the language used in their searches.

Cooperative and Copy Cataloging

The process of cataloging described earlier is often referred to as *original cataloging*. Fortunately, it is not necessary for every information resource in every library to be cataloged originally in that library. Because libraries acquire copies of many of the same items, or decide to catalog the same online resources, their catalogers can share metadata by adapting a copy of the original cataloging created by another library for their own catalogs, a process commonly called *copy cataloging*.^[13] This is related to the idea of *cooperative cataloging*, the working together of independent institutions to share network memberships or to create cataloging that can be used by others.

In the United States, cooperative and copy cataloging efforts began in earnest in the early part of the twentieth century, when LC started selling its standard printed catalog cards to libraries in 1901. H. W. Wilson entered the field in the 1930s with simplified catalog cards for sale. A number of other companies created and sold catalog cards from the 1950s into the 1970s. In addition, LC book catalogs were available in large libraries, and methods were devised for photocopying entries from them for adaptation and use in local catalogs. With the development of the MARC format in the late 1960s, cooperative cataloging took a new turn. At first, the companies selling cards simply loaded LC’s MARC tapes into their computers and printed cards from them. But the beginning of bibliographic networks based on MARC not only changed the availability of cards but also introduced the truly cooperative availability of cataloging data. The first bibliographic network was OCLC—at first the Ohio College Library Center, but now OCLC Online Computer Library Center, Inc. Libraries can become members (either individually or

through regional networks) and contribute original cataloging to the system. Any member library then can use records found in the system contributed by LC, other national libraries, or other member libraries. At first, the OCLC cataloging system was used only for the production of cards. Once the appropriate technology became available, libraries realized that making changes to an online record is much easier than trying to adjust photocopies or preprinted cards. Now, most libraries simply download MARC records directly into their local online systems for use in their OPACs. In recent years, SkyRiver was created as an alternative to OCLC. In addition to OCLC and SkyRiver, smaller regional and local networks exist in large numbers.

The amount of original cataloging remaining after use of cooperative cataloging depends upon the type and size of library. The more specialized the library, the more original cataloging it has. Specialized collections can require a high percentage of original cataloging, even though the collection or library may be quite small. There is now increased interest in cataloging more of the unique materials (e.g., local history, digitized materials, rare foreign language resources, and genealogy materials) that local libraries may have in order to make these essentially hidden resources available to wider audiences.

In the mid-1990s, there was a movement toward outsourcing both original and copy cataloging in some libraries. Outsourcing involves contracting with vendors outside the library to do some of the cataloging (or occasionally all the cataloging) for the library. The move has both advantages and disadvantages, and much has been written on this subject.^[14,15]

In addition, vendors may provide metadata alongside the resources being sold or leased to libraries and other information institutions. In some cases, complete or nearly complete sets of records may be provided to the institution to be loaded directly into its catalog. Although it may be provided for individual resources, this type of service is more useful when dealing with large resources sets, particularly electronic resources (e.g., a collection of 5,000 streaming videos). The quality of such metadata, however, varies among vendors. Some catalog record sets may require little to no manipulation, but others may need to be enhanced or customized before being used by the institution.

FORMATS OF BIBLIOGRAPHIC RECORDS IN CATALOGS

In order for them to be displayed in retrieval tools, the surrogates created for each information resource must be encoded for machine processing or printing. The cataloging process, therefore, requires the encoding of the bibliographic records in the format of the system being used. Uniformity of display is very desirable so that patrons can

know how to read a record and where to expect to see certain metadata elements. In printed catalogs, the display of metadata was quite standard. Most libraries and card production sources followed the LC pattern, because LC-printed cards were so extensively used and because the order of elements devised by LC made a logical presentation of data. That order was codified by the various versions of the AACR.^[16]

Today, the vast majority of catalog records are created using one of the MARC formats. The first MARC format was developed at LC around 1965. The version used in the United States was, for many years, referred to as USMARC to distinguish it from the versions used in other countries (e.g., IBERMARC and danMARCAACR). The latest version, published in 1999, is called *MARC 21*. It is a “harmonization” of CAN/MARC and USMARC, and the name is meant to show that it is ready for the twenty-first century. Because many national versions of MARC exist, exchanging bibliographic data across international boundaries might be difficult, were it not for UNIMARC, created in 1977, which acts as a crosswalk or a translator between different versions of MARC and can be used as an encoding scheme itself. A general discussion of MARC and several other encoding standards can be found in Taylor and Joudrey’s *Organization of Information* and Joudrey, Taylor, and Miller’s *Introduction to Cataloging and Classification*.^[17,18]

MARC is not the only way to encode library metadata. In recent years, other approaches to encoding have been explored because some catalogers and information technologists have seen its limitations. A frequent criticism of MARC is its lack of interoperability with nonlibrary computer networks and systems. Not only does the MARC format limit the ability of libraries to interact with other forms of data, but also library metadata cannot easily be shared with other communities. The Library of Congress Working Group on the Future of Bibliographic Control stated that the library community needs to recognize that “the World Wide Web is both our technology platform and the appropriate platform for the delivery of our standards,” and “people are not the only users of the data we produce in the name of bibliographic control, but so too are machine applications that interact with those data in a variety of ways.”^[19] It is with these concerns in mind that libraries began exploring alternatives to the MARC format.

XML (ISO 8879) is a subset of the Standard Generalized Markup Language (SGML). In recent years, it has been used to store and share structured data on the World Wide Web. Like any markup language, XML is used to describe the various features and attributes found in documents, but unlike Hyper Text Markup Language (HTML)—which is also derived from SGML and is currently the language of the web—it is not focused on displaying text. Instead, XML focuses on identifying the various pieces or components of a text. For example,

HMTL allows users to manipulate the size and look of the text (using bold, larger font sizes, etc.); XML allows users to identify elements such as a document's title, its creator, relationships among the elements, what elements are required, etc. As the web has grown, HTML has been criticized because it is too simplistic to provide for many desirable applications. Some thought for a while that full support of SGML on the web was the answer. However, SGML is fairly complex and has features that make the programming involved complicated and lengthy. XML was developed as an answer to these problems. It is essentially a version of SGML that can be used on the web. Its components are the same: entities, elements, and attributes. XML is referred to as *extensible* because it allows its users to develop their own descriptive tags; it is very flexible and can be used to support many different types of web applications.

XML is touted by its developers as being just as easy to use on the web as HTML, but at the same time being as powerful as SGML.^[20] Although XML uses the same basic components as SGML, XML does not require a document type definition (DTD) or an XML schema. Schemas and DTDs are mechanisms used to define the elements and attributes used when describing documents. When attempting to consistently and fluidly share data of a particular type, in a particular community, or for a particular purpose, a defined set of tags and elements become essential for interoperability. In the library community, a MARCXML schema and DTD have been created in order to share MARC metadata with a wider community.^[21] Both mimic the content designation structure of the MARC21 bibliographic format, but encoding is in XML syntax. For example, instead of finding a title proper encoded as

```
245 14 $a The title is here / $c by
      Annie Author.
```

in the MARCXML schema, the title element would appear as:

```
<datafield tag="245" ind1="1" ind2="4">
  <subfield code="a">The title is here /
</subfield>
  <subfield code="c">by Annie Author.
</subfield>
</datafield>
```

Other XML-based approaches to library metadata include Metadata Object Description Schema, a schema for a bibliographic element set that uses natural language tags instead of the numerical MARC content designators;^[22] Metadata Authority Description Schema, a schema for an authority data element set that may be used to provide metadata about agents, events, and terms;^[23] and the Metadata Encoding & Transmission Standard, a schema for encoding descriptive, administrative, and structural metadata for digital library objects.^[24]

These approaches to encoding cataloging data, however, may not be sufficient for the type of sharing that is of interest and of concern at the time of this writing. Another project to develop a replacement for the MARC bibliographic format has been initiated by the Library of Congress. It is the aforementioned BIBFRAME, and it is meant to move cataloging data from the record structure found in the silos of traditional OPACs to the open linked data environment of the Semantic Web. This project, while still in early stages, has great potential to change the way resources are retrieved and connected.

CONCLUSION

Despite the changes in the field that have occurred over the past decade, cataloging will continue to evolve. Economics, developing technology, and the rapidly growing number of information resources in the bibliographic universe will guarantee this. Despite the current developments described earlier, the ways in which change will occur is not completely predestined. While many have tried to predict the trajectory of library cataloging throughout the centuries, many have gotten it wrong. In the 1904 edition of his *Rules for a Dictionary Catalog*, Charles Cutter stated that he could not “help thinking that the golden age of cataloging is over, and the difficulties and discussions which have furnished an innocent pleasure to so many will interest them no more. Another lost art.”^[25] In this particular case, Cutter was wrong, because more than a century later, many are still passionately discussing the difficulties and future directions of the art. While cataloging will change, what will remain constant is the desire of information institutions to maintain bibliographic control over their information resources for retrieval and historical purposes.

Cataloging Cultural Objects (CCO)

Elizabeth O'Keefe

Maria Oldal

Morgan Library and Museum, New York, U.S.A.

Abstract

The entry provides an overview of the data content standard, *Cataloging Cultural Objects* (CCO), developed by the Visual Resources Association (VRA), and published in 2006 by the American Library Association (ALA). CCO fills a gap in the array of descriptive standards by providing guidelines for visual resources curators, museum documentation specialists, archivists, librarians, or anyone engaged in the documentation of works of art and architecture, objects of material culture, and their images. The entry begins by placing CCO within the context of object and visual image cataloging and the broader framework of data content standards. Following the organization of the guide, which is divided into three parts, General Guidelines, Elements, and Authorities, it summarizes the main features of CCO. Finally, it evaluates CCO in terms of its suitability for use by the metadata communities that form its intended audience, and its sustainability.

INTRODUCTION

Cataloging Cultural Objects (CCO) is a data content standard for the description of art and cultural objects and their visual surrogates. CCO was developed by the Visual Resources Association (VRA) to provide guidance to visual resources curators, museum documentation specialists, librarians, archivists, and anyone engaged in describing works of art and architecture, objects of material culture, and their images. It was published in 2006 by the American Library Association (ALA).

The entry begins by placing CCO in the context of object and visual image cataloging, and within the broader framework of data content standards. Following the organization of the guide, which is divided into three parts—General Guidelines, Elements, and Authorities—it summarizes the main features of CCO. Finally, it evaluates CCO in terms of its suitability for use by the metadata communities that form its intended audience, and its sustainability.

HISTORICAL CONTEXT OF CCO

CCO was developed to answer the need for standards appropriate to the description of art and cultural works, as opposed to textual materials. (For a more in-depth discussion of the difference between a work in the bibliographic sense and a unique work of art or material culture, see the entry for “Work of Art.”) Data standards for the description of art and cultural objects have lagged considerably behind those used for textual materials. This can be ascribed partly to the fact that textual materials usually exist in multiples. When many libraries own a copy of the same publication,

shared cataloging becomes cost-effective, and this in turn leads to a demand for common data standards.

Long before the introduction of the computer, libraries had developed common cataloging rules, and were sharing bibliographic records through published union catalogs and catalog card distribution programs. The advent of computerization accelerated this process, leading to the development in the 1960s of Machine Readable Cataloging (MARC),^[1] a defined set of data elements that facilitated the exchange of bibliographic information and fostered the creation of modern online library catalogs and union catalogs such as Online Computer Library Center (OCLC) WorldCat.

Art and cultural objects are usually unique, which eliminates the greatest economic incentive for data standardization. As a result, museum guidelines for the documentation of objects were developed and implemented locally, and tailored to local needs, rather than based on a broader conceptual framework. The emergence of computing technology and the digital revolution kindled new interest in data standards. Although records for unique objects cannot be shared in the same way as records for copies of the same book, use of a common set of data elements and of controlled access points formulated according to agreed-upon rules facilitates other types of information sharing, such as the pooling of records in union catalogs or electronic catalogs raisonnés. Early efforts by the museum community to share collection information were hampered by incompatible formats and content,^[2] making it evident that standards were a prerequisite for meaningful data exchange and sharing.

The visual resources community has long been aware of the advantages of data sharing, since there is considerable overlap in the objects depicted in image collections.

Several projects tested the viability of pooling records for art images (p. 11);^[12] the disparities and inconsistencies in cataloging brought to light when records for the same work were aggregated provided convincing proof of the need for common data standards.

The museum and visual resources communities considered, but ultimately rejected, adoption of library data standards. There was a consensus that rules developed primarily for textual materials and/or material issued through a formal publication process could not provide adequate guidance for the description of unique objects. Unlike published works, objects are non-self-describing; the cataloger must supply most of the information required to document the object, so the emphasis in library cataloging rules on transcription of information appearing on the item, and the elaborate hierarchy of preferred sources of information was not applicable to object cataloging. Moreover, the physical characteristics of objects are far more varied than those of a book, and far more important for description and retrieval. One has only to consider the fact that a bibliographic record for a book routinely omits several pieces of information required for object cataloging—the object type (book), the support (paper), the medium (ink), and the technique (printing)—to realize that library cataloging rules are inadequate for object cataloging.

Early efforts to develop standards for object cataloging focused on data format definition. The International Committee for Documentation of the International Council of Museums (CIDOC) Conceptual Reference Model,^[3] and Categories for the Description of Works of Art (CDWA)^[4] represent attempts by the museum community to articulate conceptual frameworks for the description of objects. CIDOC covers all types of material collected by museums and related institutions,^[5] while CDWA is limited to “works of art, architecture, other material culture, groups and collections of works, and related images.”^[6] The Visual Resources Association’s VRA Core^[7] was influenced by CDWA, but it expanded on areas not initially covered by CDWA, eliminated most of the elements defined for administrative data needed for managing museum objects, and added elements needed to describe images.

These standards satisfied the need for an agreed-upon set of data elements. Still lacking was a standard for defining the content of the data elements. CCO is intended to supply the missing piece. Although CCO was developed by the VRA to complement VRA Core, it is intentionally data-format neutral, and can be applied within the framework of MARC, CDWA, CIDOC, Encoded Archival Description (EAD),^[8] or any other format designed for encoding cultural heritage information.

DEVELOPMENT OF CCO

Work on CCO formally began in 2001, with the formation of a five-person editorial team drawn from the VRA Data

Standards Committee and the Getty Standards Program.^[9] Primary funding was supplied by the Getty Foundation and the Digital Library Federation, supplemented by the Andrew W. Mellon Foundation. After reviewing and evaluating existing data content standards and practices, the team developed a conceptual structure for the publication. The first draft was subjected to extensive criticism and review by an advisory committee that included members of the visual resources, museum, library, and archives communities. A Web-based beta version of CCO was posted in November 2003; 35 experts conducted an additional formal review in 2004. The guidelines were published in 2006 by the ALA on behalf of the VRA.

ORGANIZATION OF CCO

CCO is organized in three sections: General Guidelines, Elements, and Authorities. These sections are preceded by an introduction that defines its purpose, audience, scope, and methodology, and followed by a select bibliography, glossary, and index. Throughout CCO, there are copious examples illustrating individual rules, as well as sample Work records and Authority records.

Part 1, General Guidelines

Part 1 of CCO provides a conceptual framework and general guidelines for the cataloging of cultural objects and their visual surrogates. Some of the topics covered in this section are applicable to any type of cataloging: for example, issues of minimal description, item- and collection-level cataloging, indexing depth and consistency, and the use of controlled vocabularies and authority files. Other issues pertain to the special characteristics of cultural material or to the environment in which object cataloging customarily takes place. These include the following.

What are you cataloging?

This question refers not to the identification of the object (is it a painting? a sculpture? a church?) but to the focus of the record:

Before beginning the task of descriptive cataloging, a cataloguer must ask a basic but potentially complex question: What am I cataloging? This question refers to the relationship between a work and its parts, and between a work and the images that represent it.^[10]

The item described may consist of a single object produced at a discrete point in time or one reworked over the years by several different hands. It may be a single work composed of many different parts, such as a building or an altarpiece. Or it may be multiple works within a series, a set, an archival group, or a collection. In each case, the

cataloger must determine the focus of the description, and decide how many records are needed. Separate records should be created whenever there is enough unique information pertaining to a part to warrant it.

Further complications arise when the item being described is an image of an object, and therefore at one remove from the object. The image may consist of a view of the entire work, a detail of the work, or several works:

... imagine a photograph intended to document an original two-dimensional painting (i.e., a photograph that contains the entire work and nothing more). ... Now imagine that the photographer had stepped back fifteen feet, expanded the perspective, and instead of a photograph of a painting, it becomes a photograph of a painting on a wall of a building with a sculpture in the foreground. The photograph is no longer a simple image of a single work; the photograph now represents a complex layer of information open to subjective interpretation (pp. 3–4).^[10]

Related works

Since many objects are physically complex, or related to other works, CCO discusses relationships between works in some detail. Related works are defined as “works that have an important conceptual relationship to each other” (p. 377).^[10] These relationships may be intrinsic or extrinsic. Intrinsic relationships take the form of whole-part relationships: for example, the relationship between a triptych and its component panels or between a building and the various rooms, the relationship between a collection and the individual items within it, or the relationship between a series and its individual members. CCO recommends recording all intrinsic relationships. Extrinsic relationships should be noted whenever possible, especially those that are not otherwise apparent in the description, for example, when one work is preparatory for or copied from another.

Relationship between the work and the image

An image has its own characteristics, such as the medium (photograph, slide, digital file), the angle or view at which it was taken, and the date of image capture. All of these need to be recorded, but kept distinct from the description of the work depicted. In order to make a clear distinction between a work and its visual surrogate, CCO recommends creating separate work and image records, and linking the records.

Database design

In Part 1 and throughout the publication, CCO offers a great deal of guidance on database design. It is tacitly assumed that users of CCO will have a significant role in either creating the database or influencing its design, since

Fig. 1 Entity relationship diagram for CCO.

Source: From Baca.^[10] Fig. 1 (p. 20).

most visual resources collections and museum collections are managed using locally designed databases or customized versions of purchased or open source software. Although CCO may be applied in a variety of database settings, a relational database is recommended because of “the complexity of cultural information and the importance of Authority Records.” The entity relationship diagram reproduced here illustrates relationships between works, authorities, and images in a relational database implementation of CCO (Fig. 1).

Display and indexing

CCO makes a clear distinction between display data and indexing data. Its recommendations regarding the treatment of data for indexing purposes are similar to those made in library cataloging guidelines: for example, creator names that are presented in direct order in free text should be inverted for indexing purposes, and dates should be normalized to facilitate machine processing. Its discussion of display or free-text data illustrates a major difference between the cataloging environments of the object cataloger and the book cataloger. Since object catalogers must usually supply the description of the item being cataloged, rather than being obliged, as book catalogers are, to transcribe the information appearing on the item, they have much greater discretion about how to word the information. Moreover, the information in object records is more likely than the bibliographic records in a library catalog to be repurposed in multiple ways. CCO concentrates, therefore, not on giving rules for transcription but on providing guidance on recording display data in a form easily understood by the end user in a variety of different contexts, from slide labels to wall panels to Web sites.

Part 2, Elements

Part 2 describes the nine data areas that appear in Work and Image records.

- Entry 1: Object Naming (Work Type and Title)
- Entry 2: Creator Information
- Entry 3: Physical Characteristics
- Entry 4: Stylistic, Cultural, and Chronological Information
- Entry 5: Location and Geography
- Entry 6: Subject
- Entry 7: Class
- Entry 8: Description
- Entry 9: View Information

Each entry begins with a definition of the element and subelements covered in that entry, information on whether it is controlled, repeatable, or required, and a list of recommended sources of terminology. The bulk of each entry is devoted to cataloging rules. These rules, which are illustrated with numerous examples, cover syntax, suggested terminology for subelements in various media or subcategories, choice of singular versus plural (where relevant), capitalization, abbreviation, preferred language, and how to deal with ambiguity and uncertainty. The rules are followed by sections on presentation of the data (free text vs. controlled fields) and on the relationship between the work record and authority record. Each entry closes with sample work records and associated authority records.

Part 2: Entry 1, object naming

Object Naming includes two elements: Work Type and Title. Work Type identifies the work or works being cataloged and establishes the logical focus of the record. Work Type is usually based on physical form (e.g., statuette, hanging scroll, skyscraper), function (e.g., storage jar, presentation drawing, cathedral), medium or technique (e.g., engraving, watercolor, mosaic), or content (e.g., manuscript, sampler). Work Type, which is required, is recorded in a repeatable, controlled vocabulary field. In the case of multiple Work Types, one should be flagged as preferred. Work Type terms appear in the singular, unless the record describes a group of items, in which case the plural form is used.

The Title element comprises titles, identifying phrases, or names given to a work. Object titles take many forms: owner's titles (e.g., Wrigley Building), creator's titles (e.g., Hanging Spider), inscribed titles, titles referring to the owner, location, or history of the work (e.g., British Museum Harley 2788 or Bayeux Tapestry), and descriptive titles. Descriptive titles may refer to historical or religious subjects (e.g., Allegory of Music), works, places, or figures (e.g., Studies of a Female Nude); if the work is nonrepresentative, the title may simply repeat the work type (e.g., Silver Chocolate Pot). As the examples illustrate, CCO follows museum documentation practice rather than library cataloging rules by recommending the capitalization of all significant words in titles.

Unlike printed books and journal articles, many works of art or architecture are not self-describing. Catalogers must look for titles beyond the work; when no title can be found, the cataloger must construct one that indicates what the work is or what it depicts. CCO instructs catalogers to record all significant titles associated with the work, and to flag one title as preferred. A Title Type (e.g., preferred, inscribed, repository), taken from a controlled list, should be supplied for every title.

Part 2: Entry 2, creator information

Creator Information includes the name and role of every “individual, group of individuals, corporate body, cultural group, or other entity that contributed to creating, designing, producing, manufacturing, or altering the work.”^[15] An art or cultural work may be produced by multiple creators performing multiple roles, all of which should be recorded.

Creator names and roles are required. Since works of art signed by the artist are the exception rather than the rule, CCO makes provision for recording the source on which the attribution is based, and the degree of certainty (e.g., probable, doubtful, etc.) Possible sources include the work itself, stylistic analysis, traditional ascriptions, inventories, or other evidence. Former attributions should also be recorded, since art information is extremely fluid, and users may seek a work under a previous attribution.

CCO's instructions for recording information about unknown creators are based on art historical practice, which has developed an elaborate, nuanced terminology for unknown creators. Sometimes a work of art can be assigned to an anonymous creator, that is, “one whose hand is identified and whose oeuvre is established, but whose name is not known (for example, Master of The Dido Panels)” (p. 91).^[10] When no creator can be identified, but the style of the work suggests a relationship between the work and a known artist or group of artists, art historians express gradations of certainty by combining the known artist's name with a qualifier: “School of Rembrandt” or “Follower of Hokusai.” If the work cannot be associated with any known artist, it should be attributed to a nationality or a culture: “Unknown, French” or “Unknown, Maya.”

CCO recommends the use of standardized forms of creator names and roles. It provides a list of useful sources for names and role types as well as guidelines for formulating names for indexing and for display. For indexing purposes the inverted form of the name, followed by the role, is used. For displays, which in museum settings customarily contain brief biographical information about the creator, CCO recommends including the creator's name, nationality, birth and death dates, and role(s) in natural language order (e.g., sculpted by . . .).

Part 2: Entry 3, physical characteristics

Elements discussed in Physical Characteristics include Measurements, Materials and Techniques, State and Edition, and Additional Physical Characteristics, such as inscriptions and facture. CCO offers detailed guidance on recording the physical characteristics of the work types likely to be found in collections of art and cultural objects. Since these include paintings, drawings and watercolors, prints, sculpture and other three-dimensional works, books and manuscripts, furniture and architectural detail, ceramics and glass works, jewelry and utilitarian works, architecture, textiles and clothing, performance art and installations, film and video, and electronic and digital media, it is not surprising that Entry 3 is by far the longest entry in Part 2. The instructions in this entry are particularly helpful to library catalogers, who are unlikely to think of recording characteristics such as weight (for coins or megalithic monuments), size (for articles of clothing), or shape (for an oval painting). CCO recommends that the amount of detail be appropriate to an institution's needs: museums and other repositories that manage collections of physical objects will require more detailed descriptions than visual resources collections, which manage only the visual surrogates.

Measurement is a required element. Measurement types and units vary, depending on the nature of the object. CCO provides instructions on recording a bewildering variety of different types of measurement, including height and width, depth, diameter and circumference, shape, weight, volume and area, size, format, running time, scale, and structural dimensions. Measurements should be recorded in both a controlled field (to facilitate machine processing) and a user-friendly free-text display field. Here is an example for a carved gem:

Measurements display: 31 mm (1 1/8 inch) (diameter),
7.32 g (.2354 troy ounce)

Controlled fields:

Value: 31; Unit: mm; Type: diameter

Value: 7.32; Unit: gram; Type: weight (p. 113)^[10]

The Materials and Techniques element, which is also required, includes information about the creation processes (engraving, painting, photography), media (ink, oil paint), and support (paper, canvas, marble) of the work. The State and Edition element is used for works produced in multiples, such as prints (e.g., first of three states), or books (e.g., 2nd edition). The Additional Physical Characteristics element comprises features such as inscriptions and markings and facture. CCO briefly discusses condition and examination history and conservation history, but refers users to fuller treatment of these topics in Categories for the Description of Works of Art.

Part 2: Entry 4, stylistic, cultural, and chronological information

The data elements covered in Entry 4 have little in common with library descriptive cataloging standards. Style and culture have no real parallel in library cataloging, but are extremely important for cultural materials, since they provide a way to study a work in the context of other works created in the same style or in the same culture. The chronological information covered by CCO pertains to the creation, revision, and destruction of physical objects, while library cataloging focuses on the publication and copyright dates of manifestations of works.

CCO defines Style as the element that identifies “the named, defined style, historical or artistic period, movement, group, or school whose characteristics are represented in the work being cataloged” (p. 156).^[10] Stylistic terms may be based on a technique (Red-Figure) or on an artistic movement (Surrealist), or they may be related to a specific chronological period (Ming Dynasty, Renaissance). Culture is defined as the element that contains “the name of the culture, people, or nationality from which the work originated” (p. 157).^[10] Chronological information refers to “the date or range of dates associated with the creation, design, production, presentation, performance, construction, or alteration of the work or its components” (p. 157).^[10] A date may be a single point in time or a range as broad as several thousand years.

CCO offers guidance on the choice of terms for style and culture, and provides lists of controlled vocabularies. Considerable space is devoted to the syntax and presentation of dates, especially uncertain and approximate dates. Most objects do not bear a date; those by known artists can sometimes be dated by internal or external evidence, or at least assigned to a date during the artist's known years of activity. Dating for works by unknown artists is largely done through stylistic analysis; since some styles are associated with chronological periods occupying hundreds or thousands of years, date spans are necessarily very broad.

Part 2: Entry 5, location and geography

CCO defines the Location and Geography element as covering four different categories of location associated with art and cultural works: Current Location, Creation Location, Discovery Location, and Former Locations. (Topical location information is recorded in the Subject element, discussed in Entry 6.) The Current Location of an object may consist solely of a geographic place name, or a combination of the name of the owning institution and its geographic location, e.g., Florence (Italy), Galleria degli Uffizi. CCO instructs catalogers to treat the accession or inventory numbers which museums use to identify objects as Current Location information. Although it may seem superfluous to include Current Location information in a

repository's local catalog, it facilitates data exchange and retrieval in union catalogs or federated searches. If the Current Location is unknown, CCO instructs catalogers to record the last known location.

The Creation Location of a work is often unknown. Since users often search for material by this parameter, the geographic place, nationality, or culture elements in authority records for persons and corporate bodies associated with the work are often substituted for Creation Location in queries. Discovery Location becomes especially meaningful when little else is known about a work or its creation. Former Locations may refer to a work's ownership and collecting history, or be related to its exhibition, loan, conservation, or historical context. CCO also provides a list of published sources for place names, repositories, and buildings.

Part 2: Entry 6, subject

CCO defines the Subject element as "an identification, description, or interpretation of what is depicted in and by a work or image" (p. 207).^[10] This is not always easy to determine, and the difficulty is compounded by the fact that subject encompasses both what the work is about (its iconographical, narrative, thematic, or symbolic meaning), and what is actually depicted in the work (plants, animals, human figures, buildings, etc.) CCO recommends identifying both types of subject, at the level of detail appropriate to end users.

The universe of possible subjects is virtually unlimited. It may include "things, places, activities, abstract shapes, decorations, stories, and events from literature, mythology, religion, or history . . . [p]hilosophical, theoretical, symbolic, and allegorical themes and concepts" (p. 207),^[10] and human beings. The Subject element is required for all works. When a work is nonrepresentational, CCO suggests recording the form or function of the work as its subject; for example, the subject of a rug with no patterns or decoration would be "rug."

Subject information should be presented in two ways: as controlled indexing terms and as free-text description, which allows for interpretation as well as indicating ambiguity and uncertainty. A list of useful vocabularies, organized by type (e.g., event, fictional characters, plants, etc.) is provided, with the warning that subject indexing of art generally requires multiple vocabularies as well as locally supplied terms.

CCO recommends that the choice of singular or plural for subject terms reflect the number of entities depicted in the work: for example, if the work depicts one chair, the indexing term would be "chair," while "chairs" would be used for the depiction of several chairs. This is a departure from the practice of thesauri and controlled lists used in libraries, which customarily prefer the plural form of a common noun.

Part 2: Entry 7, class

The Class element is used to relate a specific work to other works with similar characteristics, such as "material, form, shape, function, region of origin, cultural context, or historical or stylistic period" (p. 235).^[10] It is generally based on the organizational scheme of a particular repository or collection, and is intended for local use only. The Class element bears a resemblance to library classification numbers, in that it facilitates browsing through groupings of similar works. But unlike library classification numbers, the Class element is not based on subject, and it is not used to arrange physical collections, but to facilitate conceptual browsing.

CCO recommends that Class terminology be less specific than the terminology used for the Object Name element, since Class is intended to place the work in a hierarchy. For example, the Class element for a Brewster chair would be "furniture," or, if greater specificity is required, "chairs." Plural terms are preferred, since classifications represent groups of similar items, rather than an individual item. The Class element is the only CCO element for which a free-text version is not recommended; if desired, the controlled terms may be concatenated for display purposes. For example, the hierarchy of classification for a painted Chinese screen could be displayed as Asian art, furniture, and paintings.

Part 2: Entry 8, description

The Description element is a note that elucidates the content and context of a work. It takes the form of a concise and coherent essay-like text that elaborates on the subject, function, or significance of the work, comments on information in the other elements, and records uncertain or disputed points. Although Description is a free-text note, consistent style, grammar, and sentence structure are recommended. CCO encourages brevity, and prescribes natural word order and complete sentences. Description can be treated as a separate element within the record, or attached to the relevant fields. In either case, CCO recommends adding the source of information (usually a bibliographic citation that comes from a source authority record) and the location within the source (usually a page number). Repositories of art and cultural objects may need additional notes about the physical description, condition, conservation, or provenance of the work. Some of these notes are inappropriate for public display and may be suppressed from public view.

Part 2: Entry 9, view information

The View Information element describes how an object is depicted in an image. View Information helps users, many of whom have access to a work only through a surrogate,

to understand the nature of the original. It also helps distinguish between different images of the same work. View Information appears only in the Image record, which is linked to the Work record for the object. The Image record also contains administrative and technical metadata such as the image control number, type (slide, photography, digital file), size or dimensions, format (Cibachrome, jpeg), source, and rights information. These fields are described briefly in Part 1, but CCO does not attempt to provide exhaustive coverage of this type of data.

View Description, Type, Subject, and Date are subelements of View Information. View Description, a free-text field, and View Type, a controlled vocabulary field, both describe the “spatial, chronological or contextual aspects of the work as captured in the image view” (p. 263).^[10] These aspects include the portion or extent of the work depicted in the image, the range or position (distant or close-up), the angle or perspective, whether the image depicts the interior or exterior of a built work, cardinal directions for built works, environment, or lighting, and positional attributes for three-dimensional works (e.g., a profile view of a face).

View Subject describes subject matter specific to an image, for example, the subject of an image depicting a close-up of the hands of the Mona Lisa would be “hands” or “female hands.” View Date includes any date or range of dates associated with the capture of the image, as opposed to the creation of the object, which is recorded in the Work record, or the generation of derivative images, which is treated as administrative data within the Image record. View Date information is particularly useful for works that have been damaged, lost, or altered, or for images taken during the production or creation of a work. Both subelements may be presented as free-text and as controlled fields.

Part 3, Authorities

Part 3 of CCO is devoted to authorities. CCO recommends using controlled vocabularies whenever possible, and documenting preferred terms and variants in authority files. The authorities should be linked to Work and Image records in order to facilitate cataloging, searching, and retrieval. Five different categories of authority are defined: source (a standardized bibliographic reference used for citing sources from which information is derived),^[11] personal and corporate name, geographic place, concept, and subject. This categorization differs in two respects from the way authorities are treated in the library data format, MARC. Within MARC, concept is subsumed under subject, instead of being treated as a separate category, and an authority record is created for a work whenever a controlled access point is needed for the work. In CCO, authority records are created in the source authority only for titles of secondary material; the Work record functions

as the equivalent of an authority record for the object described in it.

General characteristics of the entries on authority files

The organization of the entry on authorities follows the same model as the entries on the CCO elements. Each entry begins with a definition of the authority type, discusses its special characteristics, gives guidance on dealing with ambiguity and uncertainty, discusses how the information should be organized, lists required elements, and provides suggestions for sources of controlled vocabulary. The “Editorial Rules” that follow cover some of the topics covered by “Cataloging Rules” in Part 2, such as capitalization, abbreviation, and preferred language; but also include guidance on the choice of preferred term, the inclusion of additional information appropriate to the authority type, and the provision of links based on associative and hierarchical relationships to other entities documented in the authority files. Each entry ends with a discussion of data presentation issues, such as indexing and display, and sample authority records.

CCO prescribes much more detail in authority records than is customary in the library world, where the rule is to include only as much information as is needed to identify the entity being described. Like the recommendation to include contextual and critical information about the object in the work record, this reflects the tendency in museums and visual resources collections to use the catalog as a vehicle for outreach and for dissemination of scholarly research. By contrast, librarians make a sharp distinction between the roles of the cataloger, the bibliographer, and the literary critic or historian, with the catalog serving chiefly as a pointer to the works themselves and to other sources of information about them.

Personal and Corporate Name Authority: CCO recommends creating personal and corporate name authority records for persons and corporate bodies associated with works of art and cultural objects. The relationship may take the form of creative responsibility, patronage, or current or former ownership, or it may be a topical relationship, when a person is depicted in a work. Authority records should be made for unknown creators identified in the Creator element as “unknown [culture or nationality]”; however, qualifiers such as “workshop of” or “school of,” which denote an unknown creator associated with a known artist, should be recorded in the Work record instead of the authority record. CCO recommends using published sources for personal and corporate names, but provides guidance on how to formulate names not found in standard sources, and how to choose among variants when standard sources offer conflicting forms. Catalogers are instructed to record variant names, and two forms of the preferred name: one in natural order for display purposes, the other in inverted order for indexing. In addition

to documenting authorized name forms, authority records should provide biographical and historical information such as birth and death dates and places, life roles, culture, race, ethnicity, and gender for persons, and start and end dates, national affiliation, functions, and location for corporate bodies.

Geographic Place Authority: Geographic Place Authorities include physical features, such as islands, rivers, and mountains, and administrative geographic entities or inhabited places, such as states, ecclesiastical governing bodies, and cities. Terms may be very broad, denoting whole continents or general regions such as the Middle East, or very narrow, denoting a street address within a city or a trench within an archaeological dig. Both current and historical places, such as archaeological sites, deserted settlements, and former nations are represented; however, fictional places such as Oz or Narnia must be entered in the Subject Authority file.

A list is provided of authoritative sources for geographic names. CCO also provides guidance on formulating place names not found in standard sources, and choosing a preferred form among variants. In addition to preferred and variant forms of the names, CCO requires recording place type (e.g., river, county) and broader context information. Broader context information consists of the next level of geographic subdivision; the broader context for Burgundy would be France. A thesaurus structure is recommended for the file, in order to allow retrieval and display by geographic hierarchies; this is particularly useful for research on art and cultural objects, since it allows contextual study on various hierarchical levels.

Concept Authority: Terms in the Concept authority file contain information about generic concepts, as opposed to proper nouns or names. Concept terms are used to describe the work type, material, processes used in creating the work, style, period, culture, creator and life roles, physical attributes of the object, and abstractions such as theoretical and critical concerns, ideologies, attitudes, and social or cultural movements. These terms appear mainly in nonsubject fields, but could be used to index subject elements of a work, for example, when a painting contains a depiction of a bronze urn.

Subject Authority: The subject authority file should be reserved for

iconographical terminology, including proper names of literary, mythological, or religious characters or themes, historical events and themes, and any other terminology needed for subjects that falls outside the scope of the other three authorities

(p. 352). Terms from the other authority files may be used to index persons, corporate bodies, places, concepts, and objects depicted in works (Figs. 2 and 3).

ASSESSMENT OF CCO

Although CCO was developed by the VRA, it is aimed at and draws upon the expertise of numerous metadata communities in addition to visual resources professionals. Members of the visual resources and museum communities shared their understanding of the nature of the materials described, and their familiarity with existing descriptive practices. Librarians and archivists contributed their knowledge of their own communities' cataloging practices as well as insights derived from bibliographic and archival control: a principles-based approach to cataloging, the value of sharing data, and the importance of standardization and of controlled vocabularies. The confluence of these cataloging traditions makes CCO a more versatile guide, and optimizes its chances of being adopted as either a primary cataloging code or a complement to other codes.

CCO is likely to have the widest acceptance in the visual resources community, from which it originates, and which forms its core user group. The array of works covered by CCO—fine arts, cultural objects, works in the built environment—coincides with the works depicted in visual resources collections. Many of CCO's provisions reflect descriptive and organizational practices in visual resources cataloging, and the detailed guidance on database design reflects the do-it-yourself database environment in which most visual resources curators operate. Although individual descriptive practices in various visual resources collections may vary considerably, CCO might be the unifying tool the community needs to bring their descriptive practices closer together, foster best practices, and pave the way to a shared cataloging environment.

In the world of museum object documentation, there is an increasing awareness of the need for and advantages of conforming to standards. CCO draws heavily on descriptive practices in museums, and it is eminently suitable for use in a museum environment, though it would have to be supplemented by CDWA for certain types of administrative metadata. For museums electing to adopt a data content standard, CCO is the logical choice.

CCO will never become the main cataloging standard for the archives and library communities, since their collections contain too much material that falls outside its scope. But CCO could provide the necessary guidance for archivists faced with describing objects such as a writing tool, an article of clothing, or a coin, since *Describing Archives: A Content Standard* (DACS), the data content standard of the Society of American Archivists, deals chiefly with group- or collection-level cataloging, and focuses mainly on textual materials. Library catalogers faced with cataloging objects could also use CCO to complement AACR, the existing data content standard. Although CCO is not always compatible with AACR, it is seldom in open conflict with it. CCO does not dictate rules for formulating access points, leaving catalogers free

Fig. 2 Image record linked to Work and Authority records: Egyptian monument. Required and recommended elements are marked with an asterisk.

Source: From Baca.^[10] 276, Fig. 43.

to continue using AACR as their guide to formulating access points within object records, while incorporating the information recommended by CCO into free-text notes. The decision to remain format neutral means that CCO records can be accommodated in EAD, the data format used by archivists, and MARC, the data format used by librarians.

CCO's future prospects also depend on its sustainability. The VRA holds the copyright to CCO, and is responsible for supporting education and training in the use of the standard as well as its maintenance and dissemination. Even before its publication, the editorial team did yeoman's work publicizing the forthcoming standard, and

seeking comments; a section of the association's Web site was devoted to early drafts. After its release, VRA took a proactive role in arranging CCO-related presentations and workshops at conferences of the main professional organizations in the relevant metadata communities, publishing articles about the standard, and expanding the CCO Commons.^[12] This area of the VRA Web site provides online support in the form of sample records, brief summaries of the rules, FAQs, training tools and presentations, and links to crosswalks, related data standards, and vocabularies. In late December 2006, two new committees were formed to provide a more formal structure for sustaining the code. The CCO Standing Committee is charged with

maintenance and dissemination, and the CCO Advisory Committee advises on education and works with the Standing Committee to encourage the use of this standard.

CONCLUSION

CCO fills a long-standing gap in the array of data content standards. Previous standards were developed largely for cataloging textual material; consequently, they did not address basic issues of cataloging art and cultural works, or provide guidance on describing the special characteristics of specific object types. CCO provides detailed guidelines for description, access, and subject cataloging of art and cultural materials and their visual surrogates. Clearly written, well-organized, and illustrated with numerous examples, it can be read with profit even by those who simply wish to learn more about the description of these materials. For information professionals charged with

creating descriptions of art and cultural materials, CCO seems likely to play the same role for object cataloging as AACR has long played for book cataloging: their basic cataloging tool.

Catalogs and Cataloging: History [ELIS Classic]

Eugene R. Hanson

Shippensburg State College, Shippensburg, Pennsylvania, U.S.A.

Jay E. Daily

University of Pittsburgh, Pittsburgh, Pennsylvania, U.S.A.

Abstract

The catalog is the enduring means of access to information about the collection of a library. Without such information, use of a library would be limited to browsing the shelves in hopes of finding materials of interest. Hanson and Daily trace the development of catalogs from ancient times to the middle of the twentieth century. In parallel they also trace the history of cataloging rules and principles through the many codes of practice that have been developed over the years. The authors' speculation on what computerized catalogs *might* be like in the future, once developed, provides an interesting sidelight on the thinking of the era preceding the automation of catalogs.

—*ELIS Classic*, from 1970

INTRODUCTION

The story of catalogs and cataloging is only one phase of the broad panorama of library development. Traditionally the library has devoted its efforts to the acquisition, preservation, and promotion of graphic materials entailing the use of some system of bibliographic organization or control. Such organization is not unique to the library. History reveals the interrelationship between the activities of the bookseller, bibliographer, and librarian, all of whom sought to organize materials for effective location or retrieval. The methods employed are similar because they have a common goal, although they are inspired by relatively different purposes. Many attempts have been made to obtain some standardization of bibliographic entries among library catalogs, book trade publications, and published bibliographies. A substantial relationship exists between cataloging, designed to serve a definite library purpose, and bibliography, which has a more universal content and application. Cataloging in the United States has tended to be independent of book dealers' needs, while many European countries have coordinated bibliographic activities for centuries. Current efforts in international cataloging will no doubt serve to promote a closer working correlation of the two efforts. The Appendix lists the codes of cataloging rules in chronological order, their significance is the international character of standardization, still under way.

The library catalog is only one of the many forms of bibliography. It is generally defined as a list of books contained within a single library and is comprehensive rather than selective. In actual practice, although catalogs list the bulk of the monograph and at least part of the serial publications within a library, practices vary depending on

the particular library. Jennette Hitchcock,^[1] in a study conducted in 1939, estimated that subject headings could be omitted for four-fifths of the 90 different types of material. The results of her survey indicated that a significant number of libraries had followed this practice of omission. Librarians customarily tend to list only books in the catalog, influenced apparently by the traditional definition, although today library collections include a wide range of graphic materials. The reverence accorded the monograph perhaps was due in part to the dominance of the codex during the early periods; it was not seriously rivaled by other forms until the seventeenth century. The origin of learned societies as a result of the scholarly endeavors of the Renaissance led to the founding of the first scholarly periodicals in the 1660s. The increasing emphasis upon science encouraged the publication of serial publications, and by the eighteenth century they were the principal vehicles for the dissemination of scientific information. Other disciplines and agencies readily adopted the new form; this led to the proliferation of government documents, proceedings of Congresses, annual reports, and popular magazines evident during the nineteenth century and reaching an all-time high by the midpoint of the twentieth century. Libraries, with their roots planted in the humanistic spirit of the past, failed to respond sufficiently and rapidly enough to the growing variety and numbers of publications outside the realm of the monograph, and proved inadequate to fulfill the expected industrial and governmental needs that now tended to dominate the national scene. As a result, specialized groups became documentalists or information scientists in much the same way that librarianship and bibliography had separated years ago. The relationships were strong, but the methods and purposes varied to the point that each considered itself a separate discipline.

The movement to gain bibliographic control of serials has traditionally been of secondary concern to most librarians, although the efforts of Poole, Cutter, and Billings indicated a growing awareness, which has continued to develop since their time. The number of periodical indexes from the nineteenth to the twentieth centuries attested to their dominant position in the bibliographic structure, even though librarians were confident that less effort was necessary and that bibliographic accuracy could be sacrificed in favor of more rapid processing.

The influence of the bibliographer on library cataloging was apparent as the position of librarian was generally relegated to a scholar or a man of letters. The librarian sought to organize the materials in a manner suitable to his needs or those of his immediate associates, without particular regard for ease of accessibility—this would come during the later years when the library was eventually recognized as an educational tool. With the rise of a pragmatic philosophy of education there came the rise of the librarian schooled in the technical aspects of practical organization rather than in bibliographical theories. The preparation of the catalog by the late nineteenth and early twentieth centuries ceased to be an immediate undertaking of the library administrator and was relegated to practitioners who were dependent upon codes and traditions rather than results. The problem, however, shortly became a concern of the total library, for the rising costs of cataloging forced both administrators and catalogers to reexamine their methods and question the need for bibliographic detail, with the hope of relying more upon the other available bibliographic tools. A period of reevaluation and technological change has brought about an increasingly pragmatic approach that attempts to fulfill the needs of the versatile user while minimizing the expense of processing time and effort.

The process of cataloging, in its narrowest sense, is the compilation of headings and bibliographic descriptions for use in the catalog. This could, perhaps, be considered the work of a pragmatic bibliographer, although catalogers are beginning to find other ways of determining the amount and kind of bibliographic descriptions necessary. In a broad sense the process encompasses descriptive cataloging that may include, in addition to bibliographic descriptions, the choice and form of author headings and subject cataloging, which results in the assignment of classification numbers and subject headings. Catalogs may be distinguished as to purpose by such designations as public catalog, which serves the patron; official catalog, which serves the cataloging staff; and union catalog, which is a list of holdings of many libraries. Format or physical form is also used as a basis of describing the catalog with the most common being card, printed book, sheaf (slip with loose leaf binder), guard book (slips mounted in a special book), computer, and visible file. The arrangement of the catalog is a third consideration. The three most popular approaches are the

dictionary, which files authors, titles, subjects, and references in one alphabet; the divided catalog, which separates some of these headings; and the classified, which utilizes a systematic arrangement of subject entries supplemented by author, subject, and title indexes in alphabetical order. Other less frequently encountered variations are alphabetic-classed for subject headings, a combination of the alphabetic-classed and the dictionary catalog, and a number of single or combined arrangements of subject alphabetical and/or author and name catalogs. To this may be added a wide variety of variations of the divided dictionary catalog based on a horizontal (chronological) arrangement as well as vertical (type of entry) arrangement resulting in a separation of subject headings from author and/or title. Other combinations are possible with the printed book catalog serving as a supplement to the card catalog or vice versa. The correlation of shelf list and/or bibliographies with a printed book or card catalog present other possibilities.

The functions of the early catalog were comparatively simple, serving as an inventory list with progressive patterns of arrangement based on the order of accession, chronologically by date of publication or period of author. From these evolved a wide variety of approaches and an expansion of the inventory idea to include retrieval. The subject catalog, which employs a system of conceptual terms to depict the content of the material, has been the major outcome of centuries of development. The derivation of subject terms or headings may be dependent upon the title or content of the book and may be standardized through the use of a classification scheme or a specially prepared list. Cutter believed that

the ideal catalog would give under every subject its complete bibliography, not only mentioning all the monographs on the subject, but all works which in any way illustrate it, including all parts of books, magazine articles, and the best encyclopedias that treat of it; in short, the catalog would lay out just that course of reading which a man who thoroughly studied the subject, with a view not only to learn it, but to master the history of its treatment by others, would be obliged to pass through.^[2]

He continued by admonishing that “this can rarely be done because it is beyond the ability of librarians and the means of libraries.” In addition, in *Rules for a Dictionary Catalog*, Cutter contended that the purpose or objects of the catalog were as follows:^[3]

1. To enable a person to find a book of which either is known: author, title, or subject.
2. To show what the library has by a given author, subject, or in a given kind of literature.
3. To assist in the choice of a book: as to its edition (bibliographically) or as to its character (literary or topical).

These were restated in the *International Conference on Cataloguing Principles* of the International Federation of Library Associations as follows:^[4]

Functions of the catalog. The catalog should be an efficient instrument for ascertaining:

- 2.1 whether the library contains a particular book specified by
 - (a) its author and title, or
 - (b) if the author is not named in the book, its title alone, or
 - (c) if author and title are inappropriate or insufficient for identification, a suitable substitute for the title; and
- 2.2
 - (a) which works by a particular author and
 - (b) which editions of a particular work are in a library.

The inventory list functioned as a catalog and only later developed into a retrieval device that became probably the most highly organized part of an interrelated bibliographic network. The expanding number of points of access in the catalog indicates the comprehensive approach now possible. As subject terminology is perfected and mechanized methods are developed and applied, new dimensions will further expand the catalog until the spectrum of organized knowledge will rest upon a combination of the total bibliographic force, not just one phase.

The catalog serves as the key to the functions of a library and is a communicative device based upon a long process of social habits, designed to provide methodical and effectual access to graphic materials.^[5] Insight into the present practices can best be achieved by a survey of the catalogs of the past with particular attention to the developing forms and purposes that are reflected in our modern catalogs. Our major attention will be directed to the English-speaking countries, particularly Great Britain through the eighteenth century and the United States during the nineteenth and twentieth centuries.

AGE OF INVENTORY

Ancient Times

Primitive methods of bibliographical control have existed since the beginning of the first libraries. The original approaches were primitive, although Norris alleged that “the catalogs in use in the seventeenth century B.C. were very similar to those which are now in use in the twentieth century A.D.”^[6] The archeological excavations at Assurbanipal (1668–626 B.C.) revealed that bibliographic information was recorded on tablets that were similar to a press guide or a very rudimentary shelf list. These tablets served as a crude location device by recording title (occasionally

with opening words), number of tablets, number of lines, distinct subdivisions, and a location or classification symbol.^[7] A similar method was employed at Edfu (200–300 B.C.), where a list of books was reputed to have been engraved on the wall.
